2 'On the Sexual Theories of Children' (1908*c*) [*RSE*, **9**, 183 ff.].

II
THEORETICAL[1]

(A) SOME GENERAL CHARACTERISTICS OF OBSESSIONAL STRUCTURES[2]

[221] In the year 1896 I defined obsessional ideas as 'transformed *self-reproaches* which have re-emerged from *repression* and which always relate to some *sexual* act that was performed with pleasure [*Lust*][T] *in childhood*'. [Freud, 1896*b* (*RSE*, **3**, 179).] This definition now seems to me to be open to criticism upon formal grounds, though its component elements are unobjectionable. It was aiming too much at unification, and took as its model the practice of obsessional neurotics themselves, when, with their characteristic liking for indeterminateness, they heap together under the name of 'obsessional ideas' the most heterogeneous psychical structures [*Bildungen*][T].[3] In point of fact, it would be more correct to speak of 'obsessive thinking' ['*Zwangsdenken*'], and to make it clear that obsessional structures can correspond to every sort of
[222] psychical act. They can be classed as wishes, temptations, impulsions, reflections, doubts, commands or prohibitions. Patients endeavour in general to tone down such distinctions and to regard what remains of these psychical acts after they have been deprived of their affective index simply as 'obsessional ideas'. Our present patient gave an example of this type of behaviour in one of his first sessions, when he attempted to reduce a wish to the level of a mere 'train of thought' (p. 137).

It must be confessed, moreover, that even the phenomenology of obsessional thinking has not yet had sufficient attention paid to it. During the secondary defensive struggle, which the patient carries on against the 'obsessional ideas' that have forced their way into his

1 [This heading was only added in 1924.]

2 Several of the points dealt with in this and the following section have already been mentioned in the literature on the subject of obsessional neuroses, as may be gathered from Löwenfeld's exhaustive study, *Die psychischen Zwangserscheinungen*, 1904, which is the standard work upon this form of disease.

3 This fault in my definition is to some extent corrected in the paper itself. The following passage can be found [three paragraphs later]: 'The reactivated memories, however, and the self-reproaches formed from them never re-emerge into consciousness unchanged: what become conscious as obsessional ideas and affects, and take the place of the pathogenic memories so far as conscious life is concerned, are structures in the nature of a compromise between the repressed ideas and the repressing ones.' In the definition, that is to say, particular stress is to be laid on the word 'transformed'.

consciousness, psychical structures make their appearance which deserve to be given a special name. (Such, for example, were the sequences of thoughts that occupied our patient's mind on his journey back from the manoeuvres.) They are not purely reasonable considerations arising in opposition to the obsessional thoughts, but, as it were, hybrids between the two species of thinking; they accept certain of the premises of the obsession they are combating, and thus, while using the weapons of reason, are established upon a basis of pathological thought. I think such structures as these deserve to be given the name of '*deliria*'. To make the distinction clear, I will give an instance, which should be inserted into its proper context in the patient's case history. I have already described the crazy conduct to which he gave way at one time when he was preparing for an examination – how, after working till far into the night, he used to go and open the front door to his father's ghost, and then look at his genitals in the looking-glass (p. 156). He tried to bring himself to his senses by asking himself what his father would say to it all if he were really still alive. But the argument had no effect so long as it was put forward in this rational shape. The spectre was not laid until he had transformed the same idea into a 'delirious' threat to the effect that if he [223]
ever went through this nonsense again some evil would befall his father in the next world.

The distinction between a primary and a secondary defensive struggle [*Abwehrkampf*] is no doubt well founded, but we find its value unexpectedly diminished when we discover that *the patients themselves do not know the wording of their own obsessional ideas*. This may sound paradoxical, but it is perfectly good sense. During the progress of a psychoanalysis it is not only the patient who plucks up courage, but his disease as well; it grows bold enough to speak more plainly than before. To drop the metaphor, what happens is that the patient, who has hitherto turned his eyes away[t] in terror from his own pathological productions, begins to attend to them and obtains a clearer and more detailed view of them.[1] [Cf. p. 95 above.]

There are, besides this, two special ways in which a more precise knowledge of obsessional structures can be gained. In the first place, experience shows that an obsessional command (or whatever it may be), which in waking life is known only in a truncated and distorted form, like a mutilated telegraph message, may have its actual text brought to

1 Some patients carry the diversion of their attention to such lengths that they are totally unable to give the content of an obsessional idea or to describe an obsessional act though they have performed it over and over again. – [The distinction between primary and secondary defence was made in the paper already quoted (1896*b*), *RSE*, **3**, 181–2.]

light in a dream. Such texts appear in dreams in the shape of speeches, and are thus an exception to the rule that speeches in dreams are derived from speeches in real life.[1] Secondly, in the course of the analytic examination of a case history, one becomes convinced that if a number of obsessions succeed one another they are often – even though their wording is not identical – ultimately one and the same. The obsession may
[224] have been successfully shaken off on its first appearance, but it comes back a second time in a distorted form and without being recognized, and may then perhaps be able to hold its own in the defensive struggle more effectively, precisely because of its distortion. But the original form is the correct one, and often displays its meaning quite openly. When we have at great pains elucidated an unintelligible obsessional idea, it often happens that the patient informs us that just such a notion [*Einfall*], wish or temptation as the one we have constructed did in fact make its appearance on one occasion before the obsessional idea had arisen, but that it did not persist. It would unfortunately involve us in too lengthy a digression if we were to give instances of this from the history of our present patient.

What is officially described as an 'obsessional idea' exhibits, therefore, in its distortion from its original wording, traces of the primary defensive struggle. Its distortion enables it to persist, since conscious thought is thus compelled to misapprehend it, just as though it were a dream; for dreams also are a product of compromise and distortion, and are also misapprehended by waking thought.[2]

This misapprehension on the part of consciousness can be seen at work not only in reference to the obsessional ideas themselves, but also in reference to the products of the secondary defensive struggle, such, for instance, as the protective formulas. I can produce two good examples of this. Our patient used to employ as a defensive formula a rapidly pronounced '*aber*' ['but'] accompanied by a gesture of repudiation. He told me on one occasion that this formula had become altered recently; he now no longer said '*áber*' but '*abér*'. When he was asked to
[225] give the reason for this new departure, he declared that the mute '*e*' of the second syllable gave him no sense of security against the intrusion,

1 See *The Interpretation of Dreams* (1900*a*), Chapter VI, Section F; *RSE*, **5**, 373 ff. – [The present case is referred to in a footnote added in 1909 to the same work, at the end of Section A of Chapter VI (ibid., **4**, 271 *n*.).]

2 [Many of the ideas in this and the preceding paragraph had already been expressed by Freud in a letter to Fliess of December 22, 1897 (Freud, 1950*a*, Letter 79). For the misapprehension of dreams by conscious thought, see Chapter VI, Section I (on 'Secondary Revision') of *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 448–9.]

which he so much dreaded, of some foreign and contradictory element, and that he had therefore decided to accent the '*e*'. This explanation (an excellent sample of the obsessional neurotic style) was, however, clearly inadequate; the most that it could claim to be was a rationalization. The truth was that '*abér*' was an approximation towards the similar-sounding '*Abwehr*' ['defence'], a term which he had learnt in the course of our theoretical discussions of psychoanalysis. He had thus put the treatment to an illegitimate and 'delirious' use in order to strengthen a defensive formula. Another time he told me about his principal magic word, which was an apotropaic against every evil; he had put it together out of the initial letters of the most powerfully beneficent of his prayers and had clapped on an 'amen' at the end of it. I cannot reproduce the word itself, for reasons which will become apparent immediately.[1] For, when he told it me, I could not help noticing that the word was, in fact, an anagram of the name of his lady. Her name contained an 's', and this he had put last, that is, immediately before the 'amen' at the end. We may say, therefore, that by this process he had brought his '*Samen*' ['semen'] into contact with the woman he loved; in imagination, that is to say, he had masturbated with her. He himself, however, had never noticed this very obvious connection; his defensive forces had allowed themselves to be fooled by the repressed ones. This is also a good example of the rule that in time the thing which is meant to be warded off [*Abzuwehrende*] invariably finds its way into the very means which is being used for warding it off [*abgewehrt*].

I have already asserted that obsessional thoughts have undergone a distortion similar to that undergone by dream thoughts before they become the manifest content of a dream. The technique of this distortion may therefore be of interest to us, and there should be nothing [226] to prevent our exhibiting its various modes by means of a series of obsessions which have been translated and made clear. But here again the conditions governing the publication of this case make it impossible for me to give more than a few specimens. Not all of the patient's obsessions were so complicated in their structure and so difficult to solve as the great rat idea. In some of the others a very simple technique was employed – namely, that of distortion by omission or ellipsis. This technique is pre-eminently applicable to jokes, but in our present case, too, it did useful work as a means of protecting things from being understood.

1 [The actual word can be found below, p. 211.]

For instance, one of the patient's oldest and favourite obsessions (which corresponded to an admonition or warning) ran as follows: '*If I marry the lady, some misfortune will befall my father* (in the next world).' If we insert the intermediate steps, which had been skipped but were known to us from the analysis, we get the following train of thought: 'If my father were alive, he would be as furious over my design of marrying the lady as he was in the scene in my childhood; so that I should fly into a rage with him once more and wish him every possible evil; and thanks to the omnipotence of my wishes[1] these evils would be bound to come upon him.'

Here is another instance in which a solution can be reached by filling out an ellipsis. It is once more in the nature of a warning or an ascetic prohibition. The patient had a charming little niece of whom he was very fond. One day this idea came into his head: '*If you indulge in intercourse, something will happen to Ella*' (i.e. she will die). When the omissions have been made good, we have: 'Every time you copulate, even with a stranger, you will not be able to avoid the reflection that in your married life sexual intercourse can never bring you a child (on account of the lady's sterility). This will grieve you so much that you will become
[227] envious of your sister on account of little Ella, and you will grudge her the child. These envious impulses will inevitably lead to the child's death.'[2]

The technique of distortion by ellipsis seems to be typical of obsessional neuroses; I have come across it in the obsessional thoughts of other patients as well. One example, a particularly transparent one, is of special interest on account of a certain structural similarity with the rat idea. It was a case of doubting, and occurred in a lady who suffered principally from obsessional *acts* [*Zwangshandlungen*]. This lady was going for a walk with her husband in Nuremberg, and made him take her into a shop, where she purchased various objects for her child and among them a comb. Her husband, finding that the shopping was too long a business for his taste, said that he had noticed some coins in an antique shop on the way which he was anxious to secure, adding that after he had made his purchase he would come and fetch her in the shop in which

1 This omnipotence is discussed further on [p. 177 below].

2 An example from another of my works, *Jokes and their Relation to the Unconscious* [1905*c*; *RSE*, **8**, 68], will recall to the reader the manner in which this elliptical technique is employed in making jokes: 'There is a witty and pugnacious journalist in Vienna, whose biting invective has repeatedly led to his being physically maltreated by the subjects of his attacks. On one occasion, when a fresh misdeed on the part of one of his habitual opponents was being discussed, somebody exclaimed: "If X hears of this, he'll get his ears boxed again." . . . The absurdity of the remark disappears if we insert in the gap: "he'll write such a scathing article upon the man that . . . etc."' – This elliptical joke, we may note, is similar in its content, as well as in its form, to the first example quoted in the text. [See p. 210 below.]

they at present were. But he stayed away, as she thought, far too long. When he came back she accordingly asked him where he had been. 'Why,' he replied, 'at the antique shop I told you about.' At the same instant she was seized by a tormenting doubt whether she had not as a matter of fact always possessed the comb which she had just bought for her child. She was naturally quite unable to discover the simple mental [228] link that was involved. There is nothing for it but to regard the doubt as having become displaced, and to reconstruct the complete chain of unconscious thoughts as follows: 'If it is true that you were only at the antique shop, if I am really to believe that, then I may just as well believe that this comb that I bought a moment ago has been in my possession for years.' Here, therefore, the lady was drawing a derisive and ironical parallel, just as when our patient thought [p. 166 above]: 'Oh yes, as sure as those two' (his father and the lady) 'will have children, I shall pay back the money to A.' In the lady's case the doubt was dependent upon her unconscious jealousy, which led her to suppose that her husband had spent the interval of his absence in paying a visit of gallantry.

I shall not in the present paper attempt any discussion of the *psychological* significance of obsessional thinking. Such a discussion would be of extraordinary value in its results, and would do more to clarify our ideas upon the nature of the conscious and the unconscious than any study of hysteria or the phenomena of hypnosis. It would be a most desirable thing if the philosophers and psychologists who develop brilliant theoretical views on the unconscious upon a basis of hearsay knowledge or from their own conventional definitions would first submit to the convincing impressions which may be gained from a first-hand study of the phenomena of obsessional thinking. We might almost go to the length of *requiring* it of them, if the task were not so far more laborious than the methods of work to which they are accustomed. I will add here only that in obsessional neuroses the unconscious mental processes occasionally break through into consciousness in their pure and undistorted form, that such incursions may take place at every possible stage of the unconscious process of thought, and that at the moment of the incursion the obsessional ideas can, for the most part, be recognized as formations of very long standing. This accounts for the [229] striking circumstance that, when the analyst tries, with the patient's help, to discover the date of the first occurrence of an obsessional idea, the patient is obliged to place it further and further back as the analysis proceeds, and is constantly finding fresh 'first' occasions for the appearance of the obsession.

(B) SOME PSYCHOLOGICAL PECULIARITIES OF OBSESSIONAL NEUROTICS: THEIR ATTITUDE TOWARDS REALITY, SUPERSTITION AND DEATH

In this section I intend to deal with a few mental characteristics of obsessional neurotics which, though they do not seem important in themselves, nevertheless lie upon the road to a comprehension of more important things. They were strongly marked in our present patient; but I know that they are not attributable to his individual character, but to his disorder, and that they are to be met with quite typically in other obsessional patients.

Our patient was to a high degree superstitious, and this although he was a highly educated and enlightened man of considerable acumen, and although he was able at times to assure me that he did not believe a word of all this rubbish. Thus he was at once superstitious and not superstitious; and there was a clear distinction between his attitude and the superstition of uneducated people who feel themselves at one with their belief. He seemed to understand that his superstition was dependent upon his obsessional thinking, although at times he gave way to it completely. The meaning of this inconsistent and vacillating behaviour can be most easily grasped if it is regarded in the light of a hypothesis which I shall now proceed to mention. I did not hesitate to assume that the truth was not that the patient still had an open mind upon this subject, but that he had two separate and contradictory convictions upon it. His
[230] oscillation between these two views quite obviously depended upon his momentary attitude towards his obsessional disorder. As soon as he had got the better of one of these obsessions, he used to smile in a superior way at his own credulity, and no events then occurred that were calculated to shake his firmness; but the moment he came under the sway of another obsession which had not been cleared up – or, what amounts to the same thing, of a resistance – the strangest coincidences would happen to support him in his credulous belief.

His superstition was nevertheless that of an educated man, and he avoided such vulgar prejudices as being afraid of Friday or of the number thirteen, and so on. But he believed in premonitions and in prophetic dreams; he would constantly meet the very person of whom, for some inexplicable reason, he had just been thinking; or he would receive a letter from someone who had suddenly come into his mind after being forgotten for many years. At the same time he was honest

enough – or rather, he was loyal enough to his official conviction – not to have forgotten instances in which the strangest forebodings had come to nothing. On one occasion, for instance, when he went away for his summer holidays, he had felt morally certain that he would never return to Vienna alive. He also admitted that the great majority of his premonitions related to things which had no special personal importance to him, and that, when he met an acquaintance of whom, until a few moments previously, he had not thought for a very long time, nothing further took place between himself and the miraculous apparition. And he naturally could not deny that all the important events of his life had occurred without his having had any premonition of them, and that, for instance, his father's death had taken him entirely by surprise. But arguments such as these had no effect upon the discrepancy in his convictions. They merely served to prove the obsessional nature of his superstitions, and that could already be inferred from the way in which they came and [231] went with the increase and decrease of his resistance.

I was not in a position, of course, to give a rational explanation of all the miraculous stories of his remoter past. But as regards the similar things that happened during the time of his treatment, I was able to prove to him that he himself invariably had a hand in the manufacture of these miracles, and I was able to point out to him the methods that he employed. He worked by means of peripheral vision and reading,[1] forgetting, and, above all, errors of memory. In the end he used himself to help me in discovering the little sleight-of-hand tricks by which these wonders were performed. I may mention one interesting infantile root of his belief that forebodings and premonitions came true. It was brought to light by his recollection that very often, when a date was being fixed for something, his mother used to say: 'I shan't be able to on such-and-such a day. I shall have to stop in bed then.' And in fact when the day in question arrived she had invariably stayed in bed!

There can be no doubt that the patient felt a need for finding experiences of this kind to act as props for his superstition, and that it was for that reason that he occupied himself so much with the inexplicable coincidences of everyday life with which we are all familiar, and helped out their shortcomings with unconscious activity of his own. I have come across a similar need in many other obsessional patients and have suspected its presence in many more besides. It seems to me easily explicable in view of the psychological characteristics of the obsessional

1 [That is, by the use of the outlying portions of the retina instead of the macula. See also p. 203 below.]

neurosis. In this disorder, as I have already explained (p. 150), repression is effected not by means of amnesia but by a severance of causal connections brought about by a withdrawal of affect. These repressed
[232] connections appear to persist in some kind of shadowy form (which I have elsewhere compared to an endopsychic perception),[1] and they are thus transferred, by a process of projection, into the external world, where they bear witness to what has been effaced from consciousness.

Another mental need, which is also shared by obsessional neurotics and which is in some respects related to the one just mentioned, is the need for *uncertainty* in their life, or for *doubt*. An enquiry into this characteristic leads deep into the investigation of drives [*Trieberforschung*]. The creation of uncertainty is one of the methods employed by the neurosis for drawing the patient away from *reality* and isolating him from the world – which is among the objects of every psychoneurotic disorder. Again, it is only too obvious what efforts are made by the patients themselves in order to be able to avoid certainty and remain in doubt. Some of them, indeed, give a vivid expression to this tendency in a dislike of – clocks and watches (for these at least make the time of day certain), and in the unconscious artifices which they employ in order to render these doubt-removing instruments innocuous. Our present patient had developed a peculiar talent for avoiding a knowledge of any facts which would have helped him in deciding his conflict. Thus he was in ignorance upon those matters relating to his lady which were the most relevant to the question of his marriage: he was ostensibly unable to say who had operated upon her and whether the operation had been unilateral or bilateral. He had to be forced into remembering what he had forgotten and into finding out what he had overlooked.

The predilection felt by obsessional neurotics for uncertainty and
[233] doubt leads them to turn their thoughts by preference to those subjects upon which all mankind are uncertain and upon which our knowledge and judgements must necessarily remain open to doubt. The chief subjects of this kind are paternity, length of life, life after death, and memory – in the last of which we are all in the habit of believing, without having the slightest guarantee of its trustworthiness.[2]

1 *The Psychopathology of Everyday Life* (1901*b*) [*RSE*, **6**, 222–3]. [The simile was first included in the 1907 edition. – The whole subject of superstition is discussed in this passage. See also Freud's later paper on 'The "Uncanny"' (1919*h*), ibid., **17**, 215 ff. – In German editions of the present paper before 1924, the word 'endopsychic' was misprinted 'endoptic'.]

2 As Lichtenberg says, 'An astronomer knows whether the moon is inhabited or not with about as much certainty as he knows who was his father, but not with so much certainty as he knows who was his mother'. A great advance was made in civilization when men decided to put

In obsessional neuroses the uncertainty of memory is used to the fullest extent as a help in the formation of symptoms; and we shall learn directly the part played in the actual content of the patients' thoughts by the questions of length of life and life after death. But as an appropriate transition I will first consider one particular superstitious trait in our patient to which I have already alluded (p. 172) and which will no doubt have puzzled more than one of my readers.

I refer to the *omnipotence* which he ascribed to his thoughts and feelings, and to his wishes, whether good or evil. It is, I must admit, decidedly tempting to declare that this idea was a delusion and that it oversteps the limits of obsessional neurosis. I have, however, come across the same conviction in another obsessional patient; and he was long ago restored to health and is leading a normal life. Indeed, all obsessional neurotics behave as though they shared this conviction. It will be [234]
our business to throw some light upon these patients' overestimation of their powers. Assuming, without more ado, that this belief is a frank acknowledgement of a relic of the old megalomania of infancy, we will proceed to ask our patient for the grounds of his conviction. In reply, he adduces two experiences. When he returned for a second visit to the hydropathic establishment at which his disorder had been relieved for the first and only time [p. 122 above], he asked to be given his old room, for its position had facilitated his relations with one of the nurses. He was told that the room was already taken and that it was occupied by an old professor. This piece of news considerably diminished his prospects of successful treatment, and he reacted to it with the unamiable thought: 'I wish he may be struck dead for it!' A fortnight later he was woken up from his sleep by the disturbing idea of a corpse; and in the morning he heard that the professor had really had a stroke, and that he had been carried up into his room at about the time he himself had woken up.[1] The second experience related to an unmarried woman, no longer young, though with a great desire to be loved, who had paid him a great deal of attention and had once asked him point-blank whether he could not love her. He had given her an evasive answer. A few days afterwards he heard

their inferences upon a level with the testimony of their senses and to make the step from matriarchy to patriarchy. – The prehistoric figures which show a smaller person sitting upon the head of a larger one are representations of patrilineal descent; Athena had no mother, but sprang from the head of Zeus. A witness who testifies to something before a court of law is still called '*Zeuge*' [literally 'begetter'] in German, after the part played by the male in the act of procreation; so too in hieroglyphics the word for a 'witness' is written with a representation of the male organ. [Cf. *RSE*, **12**, 50 and *n.* 5.]

1 [This anecdote is quoted and further discussed in Freud's paper on 'The "Uncanny"' (1919*h*), ibid., **17**, 233.]

that she had thrown herself out of a window. He then began to reproach himself, and said to himself that it would have been in his power to save her life by giving her his love. In this way he became convinced of the omnipotence of his love and of his hatred. Without denying the omnipotence of love we may point out that both these instances were concerned with death, and we may adopt the obvious explanation that, like other obsessional neurotics, our patient was compelled to overestimate the effects of his hostile feelings upon the external world, because a large
[235] part of their internal, mental effects escaped his conscious knowledge. His love – or rather his hatred – was in truth overpowering; it was precisely they that created the obsessional thoughts, of which he could not understand the origin and against which he strove in vain to defend himself.[1]

Our patient had a quite peculiar attitude towards the question of death. He showed the deepest sympathy whenever anyone died, and religiously attended the funeral; so that among his brothers and sisters he earned the nickname of 'carrion crow'.[2] In his imagination, too, he was constantly making away with people so as to show his heartfelt sympathy for their bereaved relatives. The death of an elder sister, which took place when he was between three and four years old [p. 157 above],[3] played a great part in his phantasies, and was brought into intimate connection with his childish misdemeanours during the same period. We know, moreover, at what an early age thoughts about his father's death had occupied his mind, and we may regard his illness itself as a reaction to that event, for which he had felt an obsessional wish fifteen years earlier. The strange extension of his obsessional fears to the 'next world' was nothing else than a compensation for these death wishes which he had felt against his father. It was introduced eighteen months after his father had died, at a time when there had been a revival of his sorrow at the loss, and it was designed – in defiance of reality, and in deference to the wish which had previously been showing itself in phantasies of every kind – to undo

1 [*Footnote added* 1923:] The omnipotence of thoughts, or, more accurately speaking, of wishes, has since been recognized as an essential element in the mental life of primitive people. See [Section 3 of the third essay in] *Totem and Taboo* (1912–13*a*). [The whole book is full of discussions of obsessional neurosis – especially Sections 2 and 3 (*c*) of the second essay and Sections 3 and 4 of the third.]

2 [This detail is commented on in Freud's paper on 'Dreams and Telepathy' (1922*a*), *RSE*, **18**, 208.]

3 [She died on August 24, 1881, when the 'Rat Man' was three and a half years old.]

[*aufheben*] the fact of his father's death.[1] We have had occasion in several [236]
places (pp. 169 and 172) to translate the phrase 'in the next world' by the words 'if my father were still alive'.

But the behaviour of other obsessional neurotics does not differ greatly from that of our present patient, even though it has not been their fate to come face to face with the phenomenon of death at such an early age. Their thoughts are unceasingly occupied with other people's length of life and possibility of death; their superstitious propensities have had no other content to begin with, and have perhaps no other source whatever. But these neurotics need the help of the possibility of death chiefly in order that it may act as a solution to conflicts they have left unsolved. Their essential characteristic is that they are incapable of coming to a decision, especially in matters of love; they endeavour to postpone every decision, and, in their doubt which person they shall decide for or what measures they shall take against a person, they are obliged to choose as their model the old German courts of justice, in which the suits were usually brought to an end, before judgment had been given, by the death of the parties to the dispute. Thus in every conflict which enters their lives they are on the look-out for the death of someone who is of importance to them, usually of someone they love – such as one of their parents, or a rival, or one of the objects of their love between which their inclinations are wavering. But at this point our discussion of the death complex in obsessional neuroses touches upon the problem of the drive activity of obsessional neurotics. And to this problem we must now turn.

(c) THE DRIVE ACTIVITY OF OBSESSIONAL NEUROTICS, AND THE ORIGINS OF COMPULSION AND DOUBT

If we wish to obtain a grasp of the psychical forces [*Kräfte*][T] whose inter- [237]
play built up this neurosis, we must turn back to what we have learnt from the patient on the subject of the precipitating causes of his falling ill as a grown-up man and as a child. He fell ill when he was in his twenties on being faced with a temptation to marry another woman instead of the one whom he had loved so long; and he avoided a decision of this conflict by postponing all the necessary preliminary actions. The means for doing this was given him by his neurosis. His hesitation between the lady he loved and the other girl can be reduced to a conflict between his

1 [The use by obsessional neurotics of the defensive mechanisms of 'undoing' and 'isolating' (see pp. 184 and 186 f. below) is discussed by Freud in Chapter VI of his *Inhibitions, Symptoms and Anxiety* (1926*d*), in which work, incidentally, the psychology of obsessional neurosis is examined at many points. Cf. *RSE*, **20**, 106–7.]

father's influence and his love for his lady, or, in other words, to a conflicting choice between his father and his sexual object, such as had already subsisted (judging from his recollections and obsessional ideas) in his remote childhood. All through his life, moreover, he was unmistakably victim to a conflict between love and hatred, in regard both to his lady and to his father. His phantasies of revenge and such obsessional phenomena [*Zwangserscheinungen*] as his obsession for understanding and his exploit with the stone in the road [pp. 145–6 above] bore witness to his divided feelings; and they were to a certain degree comprehensible and normal, for the lady by her original refusal [p. 148] and subsequently by her coolness had given him some excuse for hostility. But his relations with his father were dominated by a similar division of feeling, as we have seen from our translation of his obsessional thoughts; and his father, too, must have given him an excuse for hostility in his childhood, as indeed we have been able to establish almost beyond question. His attitude towards the lady – a compound of tenderness and hostility – came to a great extent within the scope of his conscious knowledge; at most he deceived himself over the degree and violence of his negative [238] feelings. But his hostility towards his father, on the contrary, though he had once been acutely conscious of it, had long since vanished from his ken, and it was only in the teeth of the most violent resistance that it could be brought back into his consciousness. We may regard the repression of his infantile hatred of his father as the event which brought his whole subsequent career under the dominion of the neurosis.

The conflicts of feeling in our patient which we have here enumerated separately were not independent of each other, but were bound together in pairs. His hatred of his lady was inevitably coupled with his attachment to his father, and inversely his hatred of his father with his attachment to his lady. But the two conflicts of feeling which result from this simplification – namely, the opposition between his relation to his father and to his lady, and the contradiction between his love and his hatred within each of these relations – had no connection whatever with each other, either in their content or in their origin. The first of these two conflicts corresponds to the normal vacillation between male and female which characterizes everyone's choice of a love object. It is first brought to the child's notice by the time-honoured question: 'Which do you love most, Daddy or Mummy?' and it accompanies him through his whole life, whatever may be the relative intensity of his feelings to the two sexes or whatever may be the sexual aim upon which he finally becomes fixed. But normally this opposition soon loses the character of a hard-and-fast

contradiction, of an inexorable 'either–or'. Room is found for satisfying the unequal demands of both sides, although even in a normal person the higher estimation of one sex is always thrown into relief by a depreciation of the other.

The other conflict, that between love and hatred, strikes us more strangely. We know that incipient love is often perceived as hatred, and that love, if it is denied satisfaction, may easily be partly converted into [239] hatred, and poets tell us that in the more tempestuous stages of love the two opposed feelings may subsist side by side for a while as though in rivalry with each other. But the *chronic* coexistence of love and hatred, both directed towards the same person and both of the highest degree of intensity, cannot fail to astonish us. We should have expected that the passionate love would long ago have conquered the hatred or been devoured by it. And in fact such a protracted survival of two opposites is only possible under quite peculiar psychological conditions and with the cooperation of the state of affairs in the unconscious. The love has not succeeded in extinguishing the hatred but only in driving it down into the unconscious; and in the unconscious the hatred, safe from the danger of being destroyed by the operations of consciousness, is able to persist and even to grow. In such circumstances the conscious love attains as a rule, by way of reaction, an especially high degree of intensity, so as to be strong enough for the perpetual task of keeping its opponent under repression. The necessary condition for the occurrence of such a strange state of affairs in a person's erotic life appears to be that at a very early age, somewhere in the prehistoric period of his infancy, the two opposites should have been split apart and one of them, usually the hatred, have been repressed.[1]

If we consider a number of analyses of obsessional neurotics we shall find it impossible to escape the impression that a relation between love and hatred such as we have found in our present patient is among the most frequent, the most marked, and probably, therefore, the most important characteristics of obsessional neurosis. But however tempting it may be to bring the problem of the 'choice of neurosis'[2] into connec- [240] tion with drive activity, there are reasons enough for avoiding such a

1 Compare the discussion on this point during one of the first sessions [pp. 138–9 above]. – [*Added* 1923:] Bleuler subsequently [1910*b*] introduced the appropriate term 'ambivalence' to describe this emotional constellation. See also a further development of this line of thought in my paper 'The Disposition to Obsessional Neurosis' (1913*i*) [*RSE*, **12**, 313].

2 [This problem was one with which Freud had long been concerned. He had made an attempt at solving it as early as in 1896. (See his letter to Fliess of May 30 of that year – Freud, 1950*a*, Letter 46.) He returned to the subject repeatedly – for instance, in the paper quoted in footnote 1 above (1913*i*).]

course. For we must remember that in every neurosis we come upon the same suppressed drives behind the symptoms. After all, hatred, kept suppressed in the unconscious by love, plays a great part in the pathogenesis of hysteria and paranoia. We know too little of the nature of love to be able to arrive at any definite conclusion here; and, in particular, the relation between the *negative* factor[1] in love and the sadistic components of the libido remains completely obscure. What follows is therefore to be regarded as no more than a provisional explanation. We may suppose, then, that in the cases of unconscious hatred with which we are concerned the sadistic components of love have, from constitutional causes, been exceptionally strongly developed, and have consequently undergone a premature and all too thorough suppression, and that the neurotic phenomena we have observed arise, on the one hand, from conscious feelings of affection which have become exaggerated as a reaction, and, on the other hand, from sadism persisting in the unconscious in the form of hatred.

But in whatever way this remarkable relation of love and hatred is to be explained, its occurrence is established beyond any possibility of doubt by the observations made in the present case; and it is gratifying to find how easily we can now follow the puzzling processes of an obsessional neurosis by bringing them into relation with this one factor. If an [241] intense love is opposed by an almost equally powerful hatred, and is at the same time inseparably bound up with it, the immediate consequence is certain to be a partial paralysis of the will and an incapacity for coming to a decision upon any of those actions for which love ought to provide the motive power. But this indecision will not confine itself for long to a single group of actions. For, in the first place, what actions of a lover are not brought into relation with his one principal motive? And secondly a man's attitude in sexual things has the force of a model to which the rest of his reactions tend to conform. And thirdly, it is an inherent characteristic in the psychology of an obsessional neurotic to make the fullest possible use of the mechanism of *displacement* [*Verschiebung*]. So the paralysis of his powers of decision gradually extends itself over the entire field of the patient's behaviour.

And here we have the domination of *compulsion* and *doubt* such as we meet with in the mental life of obsessional neurotics.

1 Alcibiades says of Socrates in the *Symposium*: 'Many a time have I wished that he were dead, and yet I know that I should be much more sorry than glad if he were to die: so that I am at my wits' end.' [Jowett's translation. – Some later views of Freud's on this subject can be found in his paper on 'Drives and their Vicissitudes' (1915*c*), *RSE*, **14**, 120–1, and in Chapter IV of *The Ego and the Id* (1923*b*), ibid., **19**, 37–8.]

The *doubt* corresponds to the patient's internal perception of his own indecision, which, in consequence of the inhibition of his love by his hatred, takes possession of him in the face of every intended action. The doubt is in reality a doubt of his own love – which ought to be the most certain thing in his whole mind; and it becomes diffused over everything else, and is especially apt to become displaced on to what is most insignificant and small.[1] A man who doubts his own love may, or rather *must*, doubt every lesser thing.[2]

It is this same doubt that leads the patient to uncertainty about his protective measures, and to his continual repetition of them in order to banish that uncertainty; and it is this doubt, too, that eventually brings it about that the patient's protective acts themselves become as impossible to carry out as his original inhibited decision in connection with his love. At the beginning of my investigations[3] I was led to assume another and more general origin for the uncertainty of obsessional neurotics and one which seemed to be nearer the normal. If, for instance, while I am writing a letter someone interrupts me with questions, I afterwards feel a quite justifiable uncertainty as to what I may not have written under the influence of the disturbance, and, to make sure, I am obliged to read the letter over after I have finished it. In the same way I might suppose that the uncertainty of obsessional neurotics, when they are praying, for instance, is due to unconscious phantasies constantly mingling with their prayers and disturbing them. This hypothesis is correct, but it may be easily reconciled with what I have just said. It is true that the patient's uncertainty whether he has carried through a protective measure is due to the disturbing effect of unconscious phantasies; but the content of these phantasies is precisely the contrary impulsion – which it was the very aim of the prayer to ward off. This became clearly evident in our patient on one occasion, for the disturbing element did not remain unconscious but made its appearance openly. The words he wanted to use in his prayer were '*May God protect her*', but a hostile '*not*' suddenly darted out of his unconscious and inserted itself into the sentence; and he understood that this was an attempt at a curse (p. 148). If the 'not' had remained mute, he would have found himself in a state of uncertainty, [242]

1 Compare the use of 'representation by something very small' as a technique in making jokes. Cf. *Jokes and their Relation to the Unconscious* [1905*c*, Chapter II. See also Freud, 1907*b*.]

2 So in the love verses addressed by Hamlet to Ophelia [Act II, Scene 2]:

Doubt thou the stars are fire;
Doubt that the sun doth move;
Doubt truth to be a liar;
But never doubt I love.

3 [See 'Obsessions and Phobias' (1895*c*), Observation VIII.]

and would have kept on prolonging his prayers indefinitely. But since it became articulate he eventually gave up praying. Before doing so, [243] however, he, like other obsessional patients, tried every kind of method for preventing the opposite feeling from insinuating itself. He shortened his prayers, for instance, or said them more rapidly. And similarly other patients will endeavour to '*isolate*' all such protective acts from other things.[1] But none of these technical procedures is of any avail in the long run. If the impulsion of love achieves any success by displacing itself on to some trivial act, the impulsion of hostility will very soon follow it on to its new ground and once more proceed to undo all that it has done.

And when the obsessional patient lays his finger on the weak spot in the security of our mental life – on the untrustworthiness of our memory – the discovery enables him to extend his doubt over everything, even over actions which have already been performed and which have so far had no connection with the love–hatred complex, and over the entire past. I may recall the instance of the woman who had just bought a comb for her little daughter in a shop, and, becoming suspicious of her husband, began to doubt whether she had not as a matter of fact been in possession of the comb for a long time [pp. 172–3 above]. Was not this woman saying point-blank: 'If I can doubt your love' (and this was only a projection of her doubt of her own love for him), 'then I can doubt this too, then I can doubt everything' – thus revealing to us the hidden meaning of neurotic doubt?[2]

The *compulsion* [*Zwang*], on the other hand, is an attempt at a compensation for the doubt and at a correction of the intolerable conditions of inhibition to which the doubt bears witness. If the patient, by the help of displacement, succeeds at last in bringing one of his inhibited inten- [244] tions to a decision, then the intention *must* be carried out. It is true that this intention is not his original one, but the energy dammed up in the latter cannot let slip the opportunity of finding an outlet for its discharge in the substitutive act. Thus this energy makes itself felt now in commands and now in prohibitions, according as the affectionate impulsion or the hostile one snatches control of the pathway leading to discharge. If it happens that a compulsive command cannot be obeyed, the tension becomes intolerable and is perceived by the patient in the form of extreme anxiety. But the pathway leading to a substitutive act,

1 [See footnote, p. 179 above.]

2 [Some remarks on another mechanism of doubt, in cases of hysteria, can be found in Section I of the case history of 'Dora' (1905*e*), *RSE*, **7**, 17. For doubt in relation to dreams, see *The Interpretation of Dreams* (1900*a*), Chapter VII, Section A; ibid., **5**, 461 ff.]

even where the displacement has been on to something very small, is so hotly contested that such an act can as a rule be carried out only in the shape of a protective measure intimately associated with the very impulsion which it is designed to ward off.

Furthermore, by a sort of *regression*, preparatory acts become substituted for the final decision, thinking replaces acting, and, instead of the substitutive act, some thought preliminary to it asserts itself with all the force of compulsion. According as this regression from acting to thinking is more or less marked, a case of obsessional neurosis will exhibit the characteristics of obsessive thinking (that is, of obsessional ideas) or of obsessive acting in the narrower sense of the word. True obsessional acts such as these, however, are only made possible because they constitute a kind of reconciliation, in the shape of a compromise, between the two antagonistic impulses. For obsessional acts tend to approximate more and more – and the longer the disorder lasts the more evident does this become – to infantile sexual acts of a masturbatory character. Thus in this form of the neurosis acts of love are carried out in spite of everything, but only by the aid of a new kind of regression; for such acts no longer relate to another person, the object of love and hatred, but are auto-erotic acts such as occur in infancy.

The first kind of regression, that from acting to thinking, is facilitated [245]
by another factor concerned in the production of the neurosis. The histories of obsessional patients almost invariably reveal an early development and premature repression of the sexual drive to looking and knowing [the scopophilic and epistemophilic drive; *des sexuellen Schau- und Wisstriebes*]; and, as we know, a part of the infantile sexual activity of our present patient was governed by that drive [p. 123 ff. above].[1]

We have already mentioned the important part played by the sadistic drive components in the genesis of obsessional neuroses. Where the epistemophilic drive is a preponderant feature in the constitution of an obsessional patient, brooding becomes the principal symptom of the neurosis. The thought process itself becomes sexualized, for the sexual pleasure which is normally attached to the content of thought becomes shifted on to the act of thinking itself, and the satisfaction derived from reaching the conclusion of a line of thought is experienced as a *sexual* satisfaction. In the various forms of obsessional neurosis in which the epistemophilic drive plays a part, its relation to thought processes

1 The very high average of intellectual capacity among obsessional patients is probably also connected with this fact.

makes it particularly well adapted to attract the energy which is vainly endeavouring to make its way forward into action, and divert it into the sphere of thought, where there is a possibility of its obtaining pleasurable satisfaction of another sort. In this way, with the help of the epistemophilic drive, the substitutive act may in its turn be replaced by preparatory acts of thought. But procrastination in *action* is soon replaced by lingering over *thoughts*, and eventually the whole process, together with all its peculiarities, is transferred into the new sphere, just as in America an entire house will sometimes be shifted from one site to another.

I may now venture, upon the basis of the preceding discussion, to determine the psychological characteristic, so long sought after, which
[246] lends to [*in Anlehnung an*] the products of an obsessional neurosis their 'obsessive' ['*Zwangsartige*', i.e. 'compulsive'] quality. A thought process is obsessive [or compulsive] when, in consequence of an inhibition (due to a conflict of opposing impulses) at the motor end of the psychical system, it is undertaken with an expenditure of energy which (as regards both quality and quantity) is normally reserved for actions alone; or, in other words, *an obsessive or compulsive thought is one whose function it is to represent an act regressively*. No-one, I think, will question my assumption that processes of thought are ordinarily conducted (on grounds of economy) with smaller displacements of energy, probably at a higher level [of cathexis], than are acts intended to bring about discharge [*Abfuhr*][T] or to modify the external world.[1]

The obsessive thought which has forced its way into consciousness with such excessive violence has next to be secured against the efforts made by conscious thought to resolve it. As we already know, this protection is afforded by the *distortion* which the obsessive thought has undergone before becoming conscious. But this is not the only means employed. In addition, each separate obsessional idea is almost invariably removed from the situation in which it originated and in which, in spite of its distortion, it would be most easily comprehensible. With this end in view, in the first place *an interval of time is inserted* between the pathogenic situation and the obsession that arises from it, so as to lead astray any conscious investigation of its causal connections,[2] and in the

1 [This last point was made by Freud in 1895 in Section 18 of Part I and towards the end of Section 1 of Part III of his posthumous 'Project for a Scientific Psychology' (Freud, 1950*a*), *RSE*, **1**, 357 f. and 394. It had also been stated in Section E of Chapter VII of his *Interpretation of Dreams* (1900*a*), ibid., **5**, 536. Freud afterwards restated it in his paper on the 'Two Principles of Mental Functioning' (1911*b*), ibid., **12**, 218.]

2 [A process of 'isolation'. See footnote, p. 179 above.]

second place the content of the obsession is taken out of its particular setting by being *generalized*. Our patient's 'obsession for understanding' is an example of this (p. 146). But perhaps a better one is afforded by another patient. This was a woman who prohibited herself from [247]
wearing any sort of personal adornment, though the exciting cause of the prohibition related to only one particular piece of jewellery: she had envied her mother the possession of it and had had hopes that one day she would inherit it. Finally, if we care to distinguish verbal distortion from distortion of content, there is yet another means by which the obsession is protected against conscious attempts at solution. And that is the choice of an indefinite or ambiguous wording. After being misunderstood, the wording may find its way into the patient's 'deliria', and whatever further processes of development or substitution his obsession undergoes will then be based upon the misunderstanding and not upon the proper sense of the text. Observation will show, however, that the deliria constantly tend to form new connections with that part of the matter and wording of the obsession which is not present in consciousness.

I should like to go back once more to the drive activity of obsessional neurotics and add one more remark upon it. It turned out that our patient, besides all his other characteristics, was a *renifleur*. By his own account, when he was a child he had recognized everyone by their smell, like a dog; and even when he was grown up he was more susceptible to sensations of smell than most people.[1] I have met with the same characteristic in other neurotics, both in hysterical and in obsessional patients, and I have come to recognize that a tendency to taking pleasure in smell, which has become extinct since childhood, may play a part in the genesis of neurosis.[2] And here I should like to raise the general question whether [248]
the atrophy of the sense of smell (which was an inevitable result of man's assumption of an erect posture) and the consequent organic repression of his pleasure in smell may not have had a considerable share in the origin of his susceptibility to nervous disease. This would afford us some explanation of why, with the advance of civilization, it is precisely the sexual life that must fall victim to repression. For we have long known

1 I may add that in his childhood he had been subject to strong coprophilic propensities. In this connection his anal erotism has already been noticed (p. 162).

2 For instance, in certain forms of fetishism. [This point is expanded in a footnote added in 1910 to the end of Section 2 (A) of the first of Freud's *Three Essays on the Theory of Sexuality* (1905*d*), *RSE*, **7**, 138 *n.* 3. – For a discussion of quite another aspect of fetishism, see Freud's paper 'Fetishism' (1927*e*), ibid., **21**, 137 ff.]

the intimate connection in the animal organization between the sexual drive and the function of the olfactory organ.[1]

In bringing this paper to a close I may express a hope that, though my communication is incomplete in every sense, it may at least stimulate other workers to throw more light upon the obsessional neurosis by a deeper investigation of the subject. What is characteristic of this neurosis – what differentiates it from hysteria – is not, in my opinion, to be found in drive activity but in the psychological field. I cannot take leave of my patient without putting on paper my impression that he had, as it were, disintegrated into three personalities: into one unconscious personality, that is to say, and into two preconscious ones between which his consciousness could oscillate. His unconscious comprised those of his impulses which had been suppressed at an early age and which might be described as passionate and evil impulses. In his normal state he was kind, cheerful and sensible – an enlightened and superior kind of person – while in his third psychological organization he paid homage to superstition and asceticism. Thus he was able to have two different creeds and
[249] two different outlooks upon life. This second preconscious personality comprised chiefly the reaction-formations against his repressed wishes, and it was easy to foresee that it would have swallowed up the normal personality if the illness had lasted much longer. I have at present an opportunity of studying a lady suffering severely from obsessional acts. She has become similarly disintegrated into an easy-going and lively personality and into an exceedingly gloomy and ascetic one. She puts forward the first of them as her official ego [*Ich*][T], while in fact she is dominated by the second. Both of these psychical organizations have access to her consciousness, but behind her ascetic personality may be discerned the unconscious part of her being – quite unknown to her and composed of ancient and long-repressed wishful impulses.[2]

1 [Freud had discussed this question in two letters to Fliess, of January 11, and November 14, 1897 (Freud, 1950*a*, Letters 55 and 75). He returned to the subject at the beginning and end of Chapter IV of *Civilization and its Discontents* (1930*a*), *RSE*, **21**, 90–6.]

2 [*Footnote added* 1923:] The patient's mental health was restored to him by the analysis which I have reported upon in these pages. Like so many other young men of value and promise, he perished in the Great War. [The 'Rat Man' was taken prisoner by the Russians on November 21, 1914, and died on November 25; but his death was only officially proclaimed on September 9, 1919.]

ADDENDUM:
ORIGINAL RECORD OF THE CASE

EDITORS' NOTE

It was Freud's practice throughout his life, after one of his works had appeared in [253]
print, to destroy all the material on which the publication was based. It is accordingly true that extremely few of the original manuscripts of his works have survived, still less the preliminary notes and records from which they were derived. (See Grubrich-Simitis, 1993.) The present record provides an unexplained exception to this rule, having been found among Freud's papers in London after his death. This fact is mentioned by the editors of the *Gesammelte Werke* in their preface to Vol. XVII, which contained a number of his posthumous writings. These notes, however, were not included in that volume. They were published for the first time in 1955 (in an English translation by Alix and James Strachey) in *SE*, **10**, 259. The unabridged, German version was first published by Elza R. Hawelka in 1974, together with a French translation, under the title *L'Homme aux rats; Journal d'une analyse*, Paris. Thereafter the notes were republished (in a corrected transcription) in *GW*, **Nachtr.**, 505 (1987). The transcriptions used for the latter editions have led to substantial revisions and corrections in the present reprint of the *SE* translation.

The manuscript, written on the usual large (38.4 x 25.4 cm.) sheets always favoured by Freud, evidently contains the actual notes which are mentioned in his footnote on p. 123 *n.* 1 above, as having been 'made on the evening of the day of treatment'. As a rule these notes were made daily, but occasionally some days are missed, the arrears being made up subsequently. In the margins of the pages single words appear from time to time, written vertically. These words – such as 'dream', 'transferences', 'masturbation phantasy' – are intended as summaries of the particular material under discussion. They were evidently inserted at some later date, probably while Freud was preparing for one or other of his presentations of the case. It has not been thought necessary to include them here but interested readers may consult the *GW*, **Nachtr.** edition, which reproduces them in full. The record breaks off for no explained reason after the entry dated January 20, 1908, when the treatment had lasted rather under four months.

The original German is for the most part written in telegraphic style, with a [254]
great number of abbreviations and the omission of pronouns and other unessential words. These are all faithfully reproduced in the *GW*, **Nachtr.** edition. There are, however, only very few places at which the meaning could not be deciphered with certainty. In order to make the material more intelligible and readable, the ellipses of the original have for the most part been expanded in the translation. In spite, therefore, of this version's formal coherence, the reader should constantly bear in mind that what follow are in fact no more than jottings made without any thought whatever of publication in an unedited form. The great majority of the proper names which occur in the record have here been replaced by others or by arbitrarily chosen initial letters. The pseudonyms used by Freud himself in the published case history have of course been retained here.

Approximately the first third of the original record was reproduced by Freud almost verbatim in the published version. This covers the preliminary interview on October 1, 1907, and the first seven sessions – that is, up to and including October 9 (to the end of Chapter I (D), p. 143 above). The alterations made by Freud were almost exclusively verbal or stylistic. In the published version Freud added a certain

amount of commentary, but the principal change was that he made the story of the manoeuvres less confused than it was as it emerged in the day-to-day record. On the whole, the differences between the two versions do not seem to be of sufficient importance to justify the publication of this first part of the record.[1] It may be of interest, however, to give the original version of Freud's first interview with the patient, which will afford some idea of the nature of the changes, though they are greater here than elsewhere in the first sessions.

'*Oct. 1, 07.* Dr Lorenz, aged 29½, said he suffered from obsessions, par-
[255] ticularly intensely since 1903, but dating back to his childhood. The chief feature was *fears of something happening to two people of whom he was very fond*, his father and a lady whom he admired. Besides this, there were compulsive impulses, e.g. to cut his throat with a razor, and prohibitions, sometimes in connection with quite unimportant things. He had wasted years of his studies, he told me, in fighting these ideas of his, and consequently had only just now passed his final law examination. His ideas only affected his professional work when it was concerned with criminal law. He also suffered from an impulse to do some injury to the lady whom he admired. This impulse was usually silent in her presence, but came to the fore when she was not there. Being away from her, however, – she lives in Vienna – had always done him good. Of the various treatments he had tried none had been of any use to him, except some hydrotherapeutic treatment in Munich, and this, he thought, had only been because he had made an acquaintance there which had led to regular sexual intercourse. Here he had no opportunities of the sort and he very seldom had intercourse, and that only irregularly, when occasion offered. He was disgusted at prostitutes. His sexual life, he said, had been stunted; masturbation had played only a small part in it, in his 16th–17th year. His potency was normal. He had first had intercourse at the age of 26.

'He gave me the impression of being a clear-headed and shrewd person. After I had told him my terms, he said he must consult his mother. The next day he came back and accepted them.'

The second two-thirds of Freud's record are translated here in full. They will be found to contain some material taken up by Freud into the published case history, but a large proportion of them cover fresh ground. If there are occasional discrepancies between the record and the published case history, it must be borne in mind
[256] that the case continued for several months after the record ceased and that there was therefore every opportunity for the patient to correct his earlier accounts and for Freud himself to obtain a clearer view of the details. The record is remarkable in that it provides the only picture we have of the kind of raw clinical material on which the whole of Freud's work rested and of the piecemeal manner in which that material

1 The entire record is of course published in the *GW*, **Nachtr**. For a comprehensive critical comparison of the two versions, see Mahony (1986).

came to light. Finally, it gives us a unique opportunity of observing the detailed working of Freud's technique at the date of this analysis.

In order to give the reader some help in following the story as it emerges, a tentative list is appended of some of the sometimes inconsistent chronological data derived from this record and from the published case history. The pseudonyms used in the published case history have again been harmonized with those used in this record.

CHRONOLOGICAL DATA

1878		Patient born. In the household there are already three other children: Hilde (*aet*. 8), Katherine (*aet*. 6) and Constanze (*aet*. 4).
1879	(*Aet*. 1)	Birth of brother Hans.
1880	(*Aet*. 2)	Birth of sister Julie.
1881	(*Aet*. 3)	Death of Katherine. Rage against father.
1882	(*Aet*. 4)	Scene with Fräulein Peter. Stuffed bird.
1883	(*Aet*. 5)	
1884	(*Aet*. 6)	Erections. Ideas that parents read his thoughts.
1885	(*Aet*. 7)	Scene with Fräulein Lina. Shot brother.
1886	(*Aet*. 8)	Birth of sister Gertrud. Went to school.
1887	(*Aet*. 9)	Death of his lady's father.
1888	(*Aet*. 10)	Worm in cousin's stool.
1889	(*Aet*. 11)	Saved by mother from father's severest chastisement; sexual enlightenment. 'Dirty pig'.
1890	(*Aet*. 12)	Mother's eructations. In love with little girl. Masturbation. Obsession of father's death.
1891	(*Aet*. 13)	Exhibited to Fräulein Lina.
1892	(*Aet*. 14)	Religious till this date. Deceived by friend interested only in sister.
1893	(*Aet*. 15)	
1894	(*Aet*. 16)	Occasional masturbation.
1895	(*Aet*. 17)	
1898	(*Aet*. 20)	Fell in love with his lady. Obsession of father's death. Suicide of woman rejected by patient. [257]
1899	(*Aet*. 21)	Operation on his lady. Death of father. Masturbation begun. Military service.
1900	(*Aet*. 22)	Oath against masturbation. Rejection by his lady.
1901	(*Aet*. 23)	Death of aunt, extension of obsessions to afterlife.
1902	(*Aet*. 24)	Illness of his lady's grandmother. Return of masturbation. Outbreak of obsessional neurosis. Exam.
1903	(*Aet*. 25)	Exam. Death of indifferent uncle. Marriage plan. Obsessional neurosis exacerbated. Exam. Second rejection by his lady. Summer holiday at resort. Suicide idea. Laying of stone.
1904	(*Aet*. 26)	First copulation.
1905	(*Aet*. 27)	Mother's marriage plan.
1906	(*Aet*. 28)	'Initial' apotropaics. Dream of Japanese swords.
1907	(*Aet*. 29)	Military manoeuvres. Beginning of analysis.

ORIGINAL RECORD OF THE CASE

* * * * * *

As regards the sessions that follow, I shall note down only a few of the essential facts, without reproducing the course of the analysis. [259]

Oct. 10. He announced that he wanted to talk about the beginning of his obsessional ideas. It turned out that he meant the beginning of his commands. [They began] while he was working for his State examination. They were connected with the lady, beginning with senseless little orders (e.g. to count up to a certain figure between thunder and lightning, to run round the room at some precise minute, etc.). In connection with his intention to slim, he was compelled by a command on his walks at Gmunden [see p. 10 *n.* 2 above] (in the summer of 1902) to go for a run in the glare of the midday heat. He had a command to take the examination in July, but resisted this on his friend's advice; but later had a command to take it at the first possible opportunity in October, and this he obeyed. He encouraged himself in his studies with the phantasy that he must hurry so as to be able to marry the lady. It appears as though this phantasy was the motive for his command. He seems to have attributed these commands to his father. He lost several weeks owing to the absence[1] of the lady, who had gone away on account of the illness of her grandmother, a very old woman. He offered to visit her there, but she refused. ('carrion crow' [see p. 178].) Just as he was up to his eyes in his work, he thought: 'You might manage to obey the command to take your examination at the earliest moment in October. But if you received a command to cut your throat, what then?' He at once became aware that this command [260] had already been given, and was hurrying to the cupboard to fetch his razor when he thought: 'No, it's not so simple as that. You must go and kill the old woman.' Upon that, he fell to the ground, beside himself with horror. – Who was it who gave him this command?

The lady still remains most mysterious. Oaths that he has forgotten. His defensive struggle against them explicit but also forgotten.

Oct. 11. Violent struggle, bad day. Resistance, because I requested him yesterday to bring a photograph of the lady with him – i.e. to give up his

1 [The original MS. has '*Anwesenheit*' (presence) – clearly an error, which was corrected to '*Abwesenheit*' in the published case history (see pp. 143–4 above).]

reticence about her. Conflict as to whether he should abandon the treatment or surrender his secrets. His conscious was far from having mastered his oscillating thoughts. He described the way in which he tries to fend off obsessional ideas. During his religious period he had made up prayers for himself which took up more and more time and eventually lasted for an hour and a half – the reason being that something always inserted itself into the simple phrases and turned them into their opposite. E.g. 'May God – not – protect him!' (An inverted Balaam.[1]) I explained the fundamental uncertainty of all measures of reassurance, because what is being fought against gradually slips into them. This he confirmed. On one such occasion the notion occurred to him of cursing: that would certainly not turn into an obsessional idea. (This was the original meaning of what had been repressed.) He had suddenly given all this up eighteen months ago; i.e. he had made up a word out of the initials of some of his prayers – something like 'Gigellsamen' (I must ask for more details about this) [cf. p. 211 below] – and said this so quickly that nothing could slip in. All this was strengthened by a certain amount of superstition, a trace of omnipotence, as though his evil wishes possessed
[261] power, and this was confirmed by real experiences. E.g. the first time he was in the Munich Sanatorium [p. 192] he had a room next to the girl with whom he had sexual relations. When he went there the second time he hesitated whether to take the same room again as it was very large and expensive. When eventually he told the girl that he had made up his mind to take it, she told him that the Professor had taken it already. 'May he be struck dead for it!' he thought. A fortnight later he was disturbed in his sleep by the idea of a corpse. He put it aside; but in the morning he heard that the Professor had really had a stroke and had been taken up to his room at about that time. He also, so he says, possesses the gift of prophetic dreams. He told me the first of these.

Oct. 12. He did not tell me the second, but told me how he had spent the day. His spirits rose and he went to the theatre. When he got home he chanced to meet his servant girl, who is neither young nor pretty but has been showing him attention for some time past. He cannot think why, but he suddenly gave her a kiss and then attacked her. Though she no doubt made only a show of resistance, he came to his senses and fled to his room. It was always the same with him: his fine or happy moments were always spoilt by something nasty. I drew his attention to the

1 [Balaam came to curse and stayed to bless.]

analogy between this and assassinations instigated by *agents provocateurs*.

He proceeded with this train of thought and reached the subject of masturbation, which in his case had a strange history. He began it when he was about 21 – after his father's death, as I got him to confirm – because he had heard of it and felt a certain curiosity. He repeated it very seldom and was always very much ashamed afterwards. One day, without any provocation, he thought: 'I swear on my blessed soul to give it up!' Though he attached no value whatever to this vow, and laughed at it on account of its peculiar solemnity, he did give it up for the time being. A few years later, at the time at which his lady's grandmother died and he [262]
wanted to join her, his own mother said: 'On my soul, you shall not go!' The similarity of this oath struck him, and he reproached himself with bringing the salvation of his mother's soul into danger. He told himself not to be more cowardly on his own account than on other people's and, if he persisted in his intention of going to join the lady, to begin to masturbate again. Subsequently he abandoned the idea of going, because he had a letter telling him not to. From that moment on the masturbation reappeared from time to time. It was provoked when he experienced especially fine moments or when he read fine passages. It occurred once, for instance, on a lovely afternoon when he heard a postilion blowing his horn in the Teinfaltstrasse [in the middle of Vienna] – until it was forbidden by a police officer, probably on the ground of some old court decree prohibiting the blowing of horns in the city. And another time it happened when he read in *Wahrheit und Dichtung*[1] how Goethe had freed himself in a burst of tenderness from the effects of a curse which a mistress had pronounced on whoever should kiss his lips; he had long, almost superstitiously, suffered the curse to hold him back, but now he broke his bonds and kissed his love joyfully again and again. (Lilli Schönemann?)[2] And he masturbated at this point, as he told me with amazement.

In Salzburg, moreover, there had been a servant girl who attracted him and whom he had to do with later as well. This led to his masturbating. He told me about it by alluding to the fact that this masturbation had spoilt a short trip to Vienna which he had been looking forward to.

He gave me some further particulars about his sexual life. Intercourse with *puellae* disgusts him. Once when he was with one he made it a

1 [So in the MS. Goethe's original version of the title.]

2 [A girl to whom Goethe was engaged for a short time during his youth. The new love referred to was actually Friederike Brion.]

[263] condition that she should undress, and, when she demanded 50 per cent extra for this, he paid her and went away, he was so much revolted by it all. On the few occasions on which he had had intercourse with girls (at Salzburg and later with the waitress in Munich) he never felt self-reproachful. How *exalté* he had been when the waitress told him the moving tale of her first love and how she had been called to her lover's deathbed. He regretted having arranged to spend the night with her, and it was only her conscientiousness that compelled him to wrong the dead man. He always sought to make a sharp distinction between relations which consisted only in copulation and everything that was called love; and the idea that she had been so deeply loved made her in his eyes an unsuitable object for his sensuality.

I could not restrain myself here from constructing the material at our disposal into an event: how before the age of six he had been in the habit of masturbating and how his father had forbidden it, using as a threat the phrase 'it would be the death of you' and perhaps also threatening to cut off his penis. This would account for his masturbating in connection with the release from the curse, for the commands and prohibitions in his unconscious and for the threat of death which was now thrown back on to his father. His constant suicidal ideas would correspond to a self-reproach of being a murderer. This, he said at the end of the session, brought up a great many ideas in his mind.

Addenda. He had been serious, he told me, in his intention to commit suicide, and was only held back by two considerations. One of these was that he could not stand the idea of his mother finding his bleeding remains. But he was able to avoid this by the phantasy of performing the deed on the Semmering[1] and leaving behind a letter requesting that his brother-in-law should be the first to be informed. (The second consideration I have curiously enough forgotten.)

[264] I have not mentioned from earlier sessions three interrelated memories dating from his fourth year, which he describes as his earliest ones and which refer to the death of his elder but smaller sister Katherine. The first was of her being carried to bed. The second was of his asking 'Where is Katherine?' and going into the room and finding his father sitting in an armchair and crying. The third was of his father bending over his weeping mother. (It is curious that I am not certain whether these memories are his or Ph.'s.[2])

1 [The mountain resort near Vienna.]

2 [Evidently another of Freud's patients.]

Oct. 14. My uncertainty and forgetfulness on these last two points seem to be intimately connected. The memories were really his and the consideration which I had forgotten was that once when he was very young and he and his sister were talking about death, she said: 'On my soul, if you die I shall kill myself.' So that in both cases it was a question of his sister's death. They were forgotten owing to complexes of my own. Moreover, these earliest recollections, when he was 3½ (and his sister 8), fit in with my construction. Death was brought close to him, and *he really believed that you die if you masturbate*.

The ideas that occurred to him [at the end of the previous session] were as follows. The idea of his penis being cut off had tormented him to an extraordinary degree, and this had happened while he was in the thick of studying. The only reason he could think of was that at that time he was suffering from the desire to masturbate. Secondly, and this seemed to him far more important, twice in his life, on the occasion of his first copulation (at Trieste) and another time in Munich – he had doubts about the first of these, though it is plausible on internal grounds – this idea occurred to him afterwards: 'This is a glorious feeling! One might do anything for this – murder one's father, for instance!' This made no sense to him, since his father was already dead. Thirdly, he described a [265]
scene of which he had often been told by other people, including his father,[1] but of which he himself had absolutely no recollection. His whole life long he has been terribly afraid of blows, and feels very grateful to his father for never having beaten him (so far as his memory goes). When other children were beaten, he used to creep away and hide, filled with terror. But when he was quite small (3 years old) he seems to have done something naughty, for which his father hit him. The little boy then flew into a terrible rage and began hurling abuse at his father. But as he knew no bad language, he called him all the names of common objects that he could think of: 'You lamp! You towel! You plate!' and so on. His father is said to have declared 'The child will either be a great man or a great criminal!' This story, the patient admitted, was evidence of anger and revenge dating back to the remote past.

I explained to him the principle of the Adige at Verona,[2] which he found most illuminating. He told me some more in connection with his revengefulness. Once when his brother was in Vienna he thought he had grounds for believing that the lady preferred him. He became so

1 [In the published version (p. 157 above) his *mother* is especially mentioned.]

2 [The River Adige makes a loop in Verona, which brings it almost back to the point at which it enters the city.]

furiously jealous over this that he was afraid he might do him some mischief. He asked his brother to have a wrestle with him, and not until he himself had been defeated did he feel pacified.

He told me another phantasy of revenge upon the lady, which he has no need to feel ashamed of. He thinks she sets store by social position. Accordingly he made up a phantasy that she had married a man of that kind in a government office. He himself then entered the same department and rose more rapidly than her husband. One day this man, now his subordinate, committed some act of dishonesty. The lady threw her-
[266] self at his feet and implored him to save her husband. He promised to, and informed her that it had only been for love of her that he had entered the service, because he had foreseen that such a moment would occur. Now his mission was fulfilled, her husband was saved, and he would resign his post. Later he went still further and felt he would prefer to be her benefactor and do her some great service without her knowing that it was he. In this phantasy he saw only the evidence of his love and not the magnanimity *à la* Monte Cristo which was designed to repress his vengeance.

Oct. 18. Arrears

He began by confessing a dishonest action when he was grown up. He was playing *vingt-et-un* and had won a great deal. He announced that he would put everything on the next hand and then stop playing. He got up to 19 and reflected for a moment whether to go any further; he then ruffled through the pack as though unintentionally and saw that the next card was in fact a two, so that when it was turned up he had a twenty-one. A childhood memory followed, of his father having egged him on to take his mother's purse out of her pocket and extract a few kreuzer from it.

He spoke of his conscientiousness since that time and his carefulness with money. He has not taken over his inheritance but has left it with his mother, who allows him a very small amount of pocket-money. In this way he is beginning to behave like a miser, though he has no such inclination. He found difficulty, too, in making his friend an allowance. He could not bring himself even to mislay any object that had belonged to his father or the lady.

Next day, continuing his associations, he spoke of his attitude towards someone called 'Reserl', who is engaged to be married but is evidently
[267] much attached to him; how he stole a kiss from her but at the same time had a distressing compulsive idea that something bad was happening to his lady – something resembling the phantasy connected with Captain

Novak [the 'cruel' captain]. His dream during the night said much more distinctly what was thus lightly touched on while he was awake:

(I) Reserl was stopping with us. She got up as though she was hypnotized, came behind my chair with a pale face and put her arms round me. It was as though I tried to shake off her embrace, as though each time she stroked my head some misfortune would occur to the lady – some misfortune in the next world too. It happened automatically – as though the misfortune occurred at the very moment of the caress.

(The dream was not interpreted. For it is in fact only a more distinct version of the obsessional idea which he did not dare to become aware of during the day.)

He was greatly affected by today's dream, for he sets much store by dreams and they have played a large part in his story and have even led up to crises.

(II) In October, 1906 – perhaps after masturbating on the occasion of reading the passage in *Wahrheit und Dichtung* [p. 197 above].

The lady was under some kind of restraint. He took his two Japanese swords and set her free. Clutching them, he hurried to the place where he suspected she was. He knew that they meant 'marriage' and 'copulation'. Both things now came true. He found her leaning up against a wall, with thumbscrews fastened to her. The dream seemed to him now to become ambiguous. Either he set her free from this situation by means of his two swords, 'marriage' and 'copulation': or the other idea was that it was only on account of them that she had got into this situation. (It was clear that he himself did not understand this alternative, though his [268] words could not possibly have any other meaning.)

The Japanese swords really exist. They hang at the head of his bed and are made of a very large number of Japanese coins. They were a present from his eldest sister at Trieste, who (as he told me in answer to an enquiry) is very happily married. It is possible that the maid, who is in the habit of dusting his room while he is still asleep, may have touched the coins and so made a noise which penetrated into his sleep.

(III) He cherished this third dream as though it were his most precious treasure.

Dec.–Jan., 1907. I was in a wood and most melancholy. The lady came to meet me, looking very pale. 'Paul, come with me before it is too late. I know we are both sufferers.' She put her arm through mine and dragged

me away by force. I struggled with her but she was too strong. We came to a broad river and she stood there. I was dressed in miserable rags which fell into the stream and were carried away by it. I tried to swim after them but she held me back: 'Let the rags go!' I stood there in gorgeous raiment.

He knew that the rags meant his illness and that the whole dream promised him health through the lady. He was very happy at the time – till other dreams came which made him profoundly wretched.

He could not help believing in the premonitory power of dreams, for he had had several remarkable experiences to prove it. Consciously he does not really believe in it. (The two views exist side by side, but the critical one is sterile.)

(IV) In the summer of 1901 he had written to one of his colleagues to send him 3 Kronen's worth of pipe tobacco. Three weeks passed with no reply and no tobacco. One morning he woke up and said he had dreamt
[269] of tobacco. Had the postman by any chance brought a parcel for him? No. – Ten minutes later the doorbell rang: the postman had brought his tobacco.

(V) During the summer of 1903,[1] while he was working for his third State examination.

He dreamt that he was asked in the examination to explain the difference between a '*Bevollmächtigter*' and a '*Staatsorgan*'.[2] Some months later, in his finals, he was actually asked this question. He is quite certain about this dream, but there is no evidence of his having spoken of it during the interval [between the dream and its coming true].

He tried to explain the previous dream by the fact that his friend had no money and that he himself may perhaps have known the date at which he was going to have some. No precise dates could be fixed.

(VI) His eldest sister has very beautiful teeth. But three years ago they began to ache, till they had to be pulled out. The dentist where she lives (a friend) said: 'You will lose all your teeth.' One day he [the patient] suddenly thought: 'Who knows what is happening to Hilde's teeth?' Perhaps he may have been having toothache himself. He had masturbated again that day, and as he was going to sleep he saw in a half-sleeping

1 [This date is wrong; the 'Rat Man' passed his third State examination in October, 1902.]

2 [A '*Bevollmächtigter*' is a person who exercises his functions by virtue of special appointment; a '*Staatsorgan*' acts by virtue of the nature of his office.]

vision his sister bothered with her teeth. Three days later he had a letter to say that another of her teeth was beginning to hurt; and she subsequently lost it.

He was astonished when I explained that his masturbation was responsible for it.[1]

(VII) A dream while he was staying with Marie Steiner. He had already told it to me but now added some details. She is a kind of childhood love [270] of his. When he was 14 or 15 he had a sentimental passion for her. He insists upon her narrow-minded ambition. In September, 1903, he visited her and saw her seven-year-old idiot brother, who made a fearful impression on him. In December he had a dream of going to his funeral. At about the same time the child died. It was not possible to fix the times more precisely. In the dream he was standing beside Marie Steiner and was encouraging her to bear up. ('carrion crow' [p. 178 above], as his eldest sister called him. He is constantly killing people so that afterwards he can ingratiate himself with them.) The contrast between the mother's doting love for the idiot child and her behaviour before his birth. She seems to have been responsible for the child's infirmity by tight-lacing too much, because she was ashamed of having a baby so late in life.

During his stay at Salzburg he was constantly pursued by premonitions which were amazingly fulfilled. For instance, there was the man whom he heard talking to the waitress at the hotel about burglary – which he took as an augury that he would see the man next as a criminal. And this actually occurred a few months later, when he happened to be transferred to the Criminal Department. – At Salzburg, too, he used to meet people on the bridge whom he had been thinking of a moment earlier. (His sister had already explained this as being accounted for by peripheral vision. [Cf. p. 175.]) – Again, he happened to think of a scene at Trieste when he had been in the public library with his sister. A man had entered into conversation with them and had talked very stupidly and said to him: 'You are still at the stage of Jean Paul's *Flegeljahre*' ['Fledgling Years']. An hour later [after thinking of this episode] he was in the Salzburg lending library, and the *Flegeljahre* was one of the first books he picked up. (But not the first. An hour earlier he had formed the intention of going to the library and it was this that reminded him of the scene at Trieste.)

At Salzburg he regarded himself as a seer. But the coincidences were [271] never of any importance and never related to things which he expected but only to trivialities.

1 [See the tooth dream below, p. 237 f.]

(The story about Marie Steiner was interpolated between two stories about his sisters. The lack of clarity of his obsessional ideas is noteworthy; in his dreams they are clearer.)

Oct. 18. Two dreams that were linked with nothing less than crises [p. 201 above]. Once before he had had the idea of not washing any more. This had come to him in the form usual with his prohibitions: 'What sacrifice am I prepared to make in order to . . . ?' But he had promptly rejected it. In reply to my questions he told me that up till puberty he had been a regular little pig. After that he had inclined towards over-cleanliness and with the onset of his illness had been fanatically clean (and that in connection with his commands). Now one day he went for a walk with the lady – he was under the impression that what he was telling me was of no importance. The lady greeted a man (a doctor), she was very friendly, too friendly – he admitted he had been somewhat jealous and had in fact spoken about it. At the lady's house they had played cards; he felt melancholy in the evening; next morning he had this dream:

(VIII) He was with the lady. She was very nice to him, and he told her about his compulsive idea and prohibition in connection with the Japanese swords[1] – the meaning of which was that he might neither marry her nor have sexual intercourse with her. But that is nonsensical, he said, I might just as well have a prohibition against ever washing again. She smiled and nodded to him. In the dream he took this to mean that she agreed with him that both things were absurd. But when he woke up it occurred to him that she had meant that he need not wash any more. He fell into a violent state of emotion and knocked his head against the
[272] bedpost. He felt as though there was a clot of blood on his head. On similar occasions he had already had the idea of making a funnel-shaped hole in his head to let what was diseased in his brain come out; the loss would somehow be made up. He does not understand his state. I explained: The Nuremberg funnel[2] – which in fact his father used often to talk about. And [the patient went on] his father used often to say, 'You'll get things into your head some day'. I interpreted this: anger, vengeance on the lady out of jealousy, the connection with the provoking cause [of the dream] – the incident on the walk – which he considered so trivial. He confirmed his anger with the doctor. He did not understand about

1 ['*Schwertern.*' In the MS. Freud miswrote '*Schwestern*' (sisters).]

2 [An instrument of torture kept in the Nuremberg museum. Water was poured through it down the victim's throat. '*Der Nürnberger Trichter*' is also used humorously to mean 'the royal road to learning'.]

the conflict as to whether he should marry her or not. He had a sense of liberation in the dream (liberation from her, I put in).

He postponed the command not to wash any more and did not carry it out. The idea was replaced by a number of others, especially of cutting his throat.

Oct. 27. Arrears. So long as he makes difficulties over giving me the lady's name his account must be incoherent. Detached incidents:

One evening in June, 1907, he was visiting his friend, Braun, whose sister, Adela, played to them. She paid him a lot of attention. He was very much oppressed and thought a great deal about the dream of the Japanese swords – the thought of marrying the lady if it were not for the other girl.

Dream at night: His sister Gerda was very ill. He went to her bedside. Braun came towards him. 'You can only save your sister by renouncing all sexual pleasure', upon which he replied in astonishment (to his shame) '*all* pleasure'.

Braun is interested in his sister. Some months ago, he brought her home once when she was feeling unwell. The idea can only have been that, if he married Adela, Gerda's marriage with Braun would become [273]
probable, too. So he was sacrificing himself for her. In the dream he was putting himself in a compulsive situation so as to be obliged to marry. His opposition to his lady and his inclination to unfaithfulness are plain. When he was 14 he had homosexual relations with Braun – looking at each other's penis.

At Salzburg in 1906 he had this idea during the daytime. Supposing the lady said to him, 'You must have no sexual pleasure till you have married me', would he take an oath not to have any? A voice in him said 'yes'. (Oath of abstinence in his unconscious.) That night he dreamt that he was engaged to the lady, and as he was walking with her arm through his, he said overjoyed, 'I should never have imagined that this could have come true so soon'. (This referred to his compulsive abstinence. This was most remarkable, and correct; and it confirmed the view I took above.) At that moment he saw the lady make a face as though the engagement were of no interest to her. His happiness was quite spoilt by this. He said to himself, 'You're engaged and not at all happy. You're pretending to be a bit happy so as to persuade yourself that you are.'

After I had persuaded him to reveal the name of Gisa Hertz and all the details about her, his account became clear and systematic. Her predecessor was Lise O., another Lise (II [see p. 210 below]). (He always had

several interests simultaneously, just as he had several lines of sexual attachments, derived from his several sisters.)

Summer 1898. (Aged 20.) Dream: He was discussing an abstract subject with Lise II. Suddenly the dream image vanished and he was looking at a big machine with an enormous number of wheels, so that he was astonished at its complexity. – This has to do with the fact that this Lise [274] always seemed to him very complex compared with Julie[1] whose admirer he also was at that time and who had recently died.

He went on to give me a lengthy account of his relations with his lady. On the evening after she had refused him he had the following dream (Dec., 1900): 'I was going along a street. There was a pearl lying in the road. I stooped to pick it up but every time I stooped it disappeared. Every two or three steps it appeared again. I said to myself, "You mayn't".' He explained this prohibition to himself as meaning that his pride would not allow it, because she had refused him once. Actually it was probably a question of a prohibition by his father which originated in his childhood and extended to marriage. He then called to mind an actual remark of his father's to a similar effect: 'Don't go up there so often.' 'You'll make yourself ridiculous' was another snubbing remark of his. Further to the dream: A short time before he had seen a pearl necklace in a shop and had thought that if he had the money he would buy it for her. He often called her a pearl among girls. This was a phrase they often used. 'Pearl' also seemed to him to fit her because a pearl is a hidden treasure that has to be looked for in its shell.

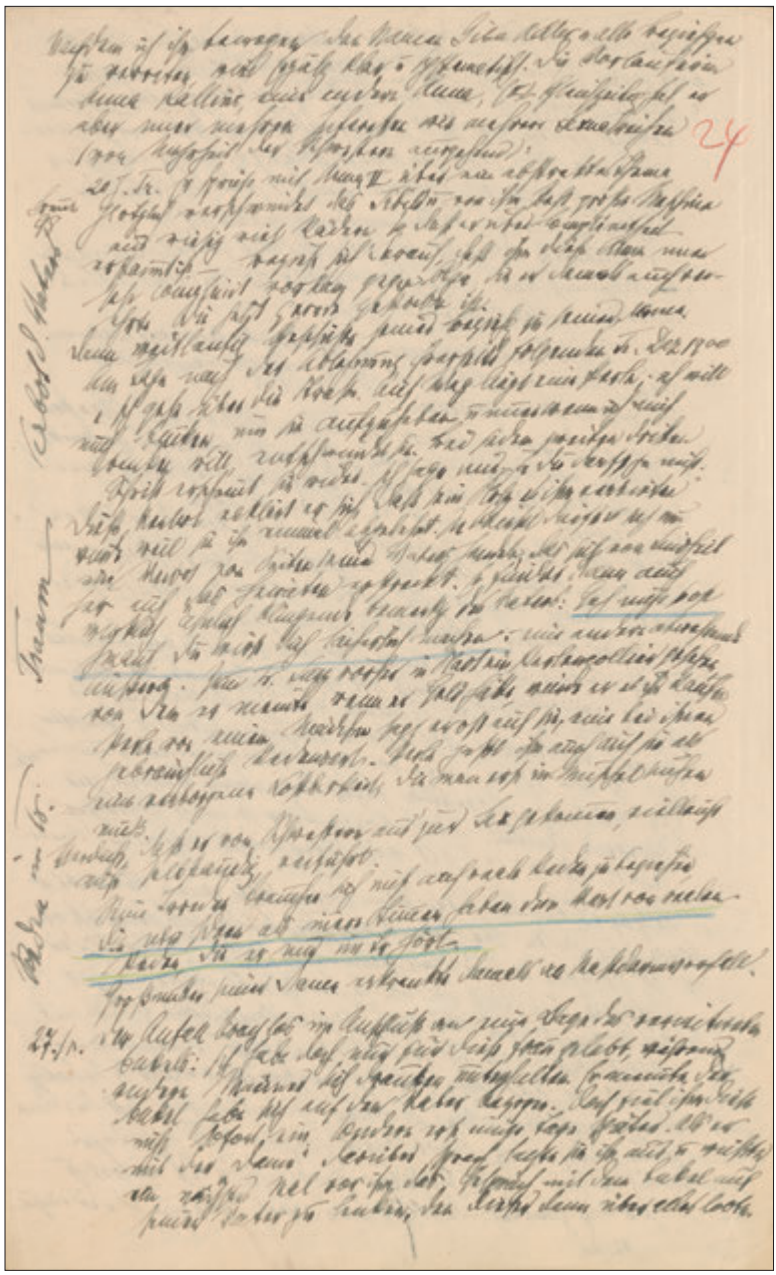
A suspicion that it was through his sisters that he was led to sexuality, perhaps not on his own initiative – that he had been seduced.

The speeches in his dreams need not be related to real speeches. *His unconscious ideas – as being internal voices – have the value of real speeches which he hears only in his dreams*. [See above, pp. 169–70.]

His lady's grandmother's illness [see p. 195] was a disease of the rectum.

Oct. 27. The onset of his illness followed a complaint made by his widowed uncle: 'I lived for this woman alone, whereas other men amuse themselves elsewhere.' He thought his uncle was referring to his father, [275] though this did not occur to him at once, but only a few days later. When he spoke to the lady about it she laughed at him, and on another occasion, when he and his uncle were present, she managed to bring the conversation round to his father, whom his uncle then praised to the

1 [This cannot be the patient's sister of the same name, who was alive at the time of the analysis (cf. p. 236 below).]



Page from the original record of the ‘Rat Man’ case

Page from the original record of the 'Rat Man' case

This page corresponds roughly to p. 206 of the present volume, starting with the words 'After I had persuaded him . . .' (bottom of p. 205) and ending with '. . . praised to the skies' (top of p. 207). Noteworthy are the vertical marginalia – summaries of the material under discussion – which are not reproduced in the *RSE*. The examples here, from top to bottom, read: 'Prohibition by the father', 'Dream' and 'Speeches in dreams'.

By permission of The Marsh Agency Ltd., on behalf of Sigmund Freud Copyrights.

skies. But this was not enough for him. A little time afterwards he felt obliged to put a direct question to his uncle as to whether he had meant his father, which his uncle denied in astonishment. The patient was particularly surprised at this episode, since he himself would not have blamed his father in the least if he had had an occasional lapse.

In this context he mentioned a half-joking remark of his mother's about the period when his father had had to live at Pressburg and came to Vienna only once a week. (When he first told me this, he omitted this characteristic connection.)

Remarkable coincidence while he was studying for his second State examination. He omitted to read two passages only, each of four pages, and it was precisely on these that he was examined. Afterwards, while he was studying for the third examination, he had a prophetic dream [see below]. This period saw the beginning proper of his piousness and of phantasies of his father still being in contact with him. He used to leave the door to the passage open at night in the conviction that his father would be standing outside. His phantasies at this time were directly attached to this gap in attainable knowledge. He finally pulled himself together and tried to get the better of himself by a sensible argument – what would his father think of his goings on if he was still alive? But this made no impression on him, he was only brought to a stop by the delirious form of the phantasy – that his father might suffer because of his phantasies even in the afterlife.

The compulsions that arose while he was studying for the third examination, to the effect that he must positively take it in July, seem to have been related to the arrival from New York of an uncle of the lady's, X.,[1] [276] of whom he was fearfully jealous; and perhaps even to his suspicion (afterwards confirmed) that the lady would travel to America.

Oct. 29. I told him I suspected that his sexual curiosity had been kindled in relation to his sisters. This had an immediate result. He had *a memory that he first noticed the difference between the sexes when he saw his deceased sister Katherine (five years his senior) sitting on the pot, or something of the sort*.

He told me the dream he had had while studying for the third examination [see above]. Grünhut[2] made a practice every third or fourth time in the examination of asking one particular question about drafts payable at a specified place; and when he had been answered he would go on to

1 [This uncle is the lady's 'cousin' Richard (Dick); see p. 145 above.]

2 [Professor of Law in Vienna.]

ask, 'and what is the reason for this law?' To which the correct answer was 'as a protection against the chicanery [*Chicanen*] of the opposing parties'.[1] His dream was on precisely these lines, but he replied instead, 'as a protection against the *Schügsenen*',[2] etc. It was a joke which he might equally well have made when he was awake.

His father's name was not David but Friedrich. Adela was not Braun's sister; the idea of the double marriage must be dropped.

Nov. 8. When he was a child he suffered much from worms [pp. 162–3 above]. He probably used to put his fingers up his behind and was an awful pig, he said, like his brother. Now carries cleanliness to excess.

Phantasy before sleep: He was married to his cousin [the lady]. He kissed her feet; but they weren't clean. They had black marks on them,
[277] which horrified him. During the day he had not been able to wash very carefully and had noticed the same thing on his own feet. He was displacing this on to his lady. During the night he dreamt that he was licking her feet, which were clean, however. This last element is a dream wish. The perversion here is exactly the same as the one we are familiar with in its undistorted form.

That the behind was particularly exciting to him is shown by the fact that when his sister asked him what it was that he liked about his cousin he replied jokingly, 'her behind'. The dressmaker whom he kissed today first excited his libido when she bent down and showed the curves of her buttocks especially clearly.

Postscript to the rat adventure. Captain Novak said that this torture ought to be applied to some members of parliament. The idea then came to him, that he [N.] must not mention Gisa,[3] and to his horror immediately afterwards he did mention Dr Hertz,[4] which once more seemed to him a fateful occurrence. His cousin is actually called Hertz and he at once thought that the name Hertz would make him think of his cousin, and he sees the point of this. *He tries to isolate his cousin from everything dirty.*

He suffers from sacrilegious compulsions, like nuns. A dream had to do with joking terms of abuse used by his friend V. – 'son of a whore', 'son of a one-eyed monkey' (*Arabian Nights*).

When he was eleven he was initiated into the secrets of sexual life by

1 [I.e. the unjustified exercise of their rights.]

2 [A Yiddish term for non-Jewish girls.]

3 [I.e. Gisela, his beloved lady cousin.]

4 [The original name is that of a then well-known public figure in Austria.]

his [male] cousin, whom he now detests, and who made out to him that all women were whores, including his mother and sisters. He countered this with the question 'Do you think the same of *your* mother?'

Nov. 11. During an illness of his cousin's (throat trouble and disturbances of sleep), at the time when his affection and sympathy were at their greatest, she was lying on a sofa and he suddenly thought, '*May she lie like this for ever*'. He interpreted this as a wish that she should be permanently ill, for his own relief, so that he could be freed from his dread of her being ill. An over-clever misunderstanding! What he has already told me shows that this was connected with a wish to see her defenceless, because of her having resisted him by rejecting his love; and it corresponds crudely to a necrophilic phantasy which he once had consciously but which did not venture beyond the point of looking at the whole body. [278]

He is made up of three personalities – one humorous and normal, another ascetic and religious and a third immoral and perverse.

Inevitable misunderstanding of the unconscious by the conscious, or rather, distortion of the shape of the unconscious wish through censorship.

The hybrid thoughts resulting from these.

Nov. 17. So far he has been in a period of rising spirits. He is cheerful, untrammelled and active, and is behaving aggressively to a girl, a dressmaker. A good idea of his that his [moral] inferiority really deserved to be punished by illness. Confessions followed about his relations to his sisters. He made, so he said, repeated aggressive attacks on his next younger sister, Julie, after his father's death; and these – he had once actually assaulted her – must have been the explanation of his pathological changes.

He once had a dream of copulating with Julie. He was overcome with remorse and fear at having broken his vow to keep away from her. He woke up and was delighted to find it was only a dream. He then went into her bedroom and smacked her bottom under the bedclothes. He could not understand it, and could only compare it with his masturbating when he read the passage in *Dichtung und Wahrheit* [p. 197 above]. From this we conclude that his being chastised by his father [p. 199] was related to assaulting his sisters. But how? Purely sadistically or already in a clearly sexual way? His elder or his younger sisters? Julie is three years his junior, and as the scenes we are in search of must have been when he was three or four, she can scarcely be the one. Katherine, his sister who died? [279]

His sanction to the effect that something would happen to his father in the next world is simply to be understood as an *ellipse*. *What it meant was: 'If my father was still alive and learnt of this he would chastise me again and I should fly into a rage with him once more, and this would cause his death, since my affects are omnipotent.' Thus this belongs to the class: 'If Kraus reads this he'll get his ears boxed.'*[1]

Even in recent years, when his youngest sister was sleeping in his room, he took off her bedclothes in the morning so that he could see the whole of her. Then his mother came into the picture as an obstacle to his sexual activity, having taken over this role since his father's death. She protected him against the well-meaning attempts at his seduction by a housemaid called Lise. He once exhibited to the latter very ingeniously in his sleep. He had fallen asleep, exhausted, after an attack of illness and lay uncovered. When, in the morning, the girl spoke to him she asked him suspiciously if he had laughed in his sleep. He *had* laughed – on account of a most lovely dream in which his cousin had appeared. He admitted that it was a device. In earlier years he had exhibited frankly. When he was thirteen he still did so to [Fräulein] Lina, who came back for a short time. He gave the correct excuse for this that she knew exactly what he was like from his early childhood. (She had been with them while he was between six and ten.)

Nov. 18. He went into his cousin's neurosis, which was becoming clear to him, in which her stepfather, who came on the scene when she was
[280] twelve, plays a part. He was an officer, a handsome man, and is now separated from her mother. Gisa treats him very badly when sometimes he comes to visit them, and he always tries to soften her towards him. The details as told to me leave very little doubt that he made a sexual attack on the girl and that something in her, which she was unaware of, went part of the way to meet him – the love transferred from her real father whom she had missed since she was six. Thus the situation between them is, as it were, frozen stiff. It seems as though the patient himself knew this. For he was very upset during the manoeuvres when Captain N. mentioned the name of a Frau Gisela Fluss (!!!),[2] as though he wanted to prevent any contact between Gisa and an officer. A year before he had a curious dream about a Bavarian lieutenant whom Gisa rejected as a suitor. This pointed to Munich and his affair with the

1 [Karl Kraus, editor of the Vienna periodical *Die Fackel*. See p. 172 *n.* 2 above.]

2 [During his schooldays Freud had been in love with a girl of the same name – hence his exclamation marks. See Jones (1953, **1**, 28); further, see Freud's paper on 'Screen Memories' (1899*a*), *RSE*, **3**, 300 ff., which Bernfeld (1946) has identified as a disguised autobiographical text.]

waitress, but there was no association to the lieutenant, and an addendum to the dream about officers' batmen only pointed to the stepfather lieutenant.

Nov. 21. He admits he himself may have had similar suspicions about his cousin. He was very cheerful and has had a relapse into masturbation, which has hardly disturbed him at all (interpolated latency period). When he first masturbated he had an idea that it would result in an injury to someone he was fond of (his cousin). He therefore pronounced a *protective formula* constructed *as we already know* [p. 196 above] *from extracts* from various *short prayers* and fitted with an isolated '*amen*'. We examined it. It was:

Glejisamen: gl = *glückliche* [happy], i.e. may L [Lorenz] be happy; also, [may] all [be happy].
e = (meaning forgotten). [281]
j = *jetzt und immer* [now and ever].
i (present faintly beside the j).
s (meaning forgotten).

It is easy to see that this word is made up of

GISELA
S AMEN

and that he united his '*Samen*' ['semen'] with the body of his beloved, i.e. putting it bluntly, had masturbated with her image. He was, of course, convinced and added that sometimes the formula had secondarily taken the shape of Giselamen, but that he had regarded this as being only an assimilation to his lady's name (an inverted misunderstanding).

Next day he came in a state of deep depression, and wanted to talk about indifferent subjects; but he soon admitted that he was in a crisis. The most frightful thing had occurred to his mind while he was on the tram yesterday. It was quite impossible to say it. His cure would not be worth such a sacrifice. I should turn him out, for it concerned the transference. Why should I put up with such a thing? None of the explanations I gave him about the transference (which did not sound at all strange to him) had any effect. It was only after a forty minutes' struggle – as it seemed to me – and after I had revealed the element of revenge against me and had shown him that by refusing to tell me and by giving up the treatment he would be taking a more outright revenge on me than by telling me – only after this did he give me to understand that it concerned my daughter. With this, the session came to an end.

It was still hard enough. After a struggle and assertions by him that my undertaking to show that all the material concerned only himself looked like anxiety on my part, he surrendered the first of his ideas.

[282] (*a*) A naked female bottom, with nits (larvae of lice) in the hair.

Source. A scene with his sister Julie which he had forgotten in his confession to me. After their romp she had thrown herself back on the bed in such a way that he saw those parts of her form in front – without lice of course. As regards the lice, he confirmed my suggestion that the word 'nits' indicated that something similar had once occurred long ago in the nursery.

The themes are clear. Punishment for the pleasure he felt at the sight, *asceticism making use of the technique of disgust*, anger with me for forcing him to [become aware of] this; hence the transference thought, 'No doubt the same thing happens among your children.' (He has heard of a daughter of mine and knows I have a son. Many phantasies of being unfaithful to Gisa with this daughter and punishment for this.)

After quieting down and a short struggle he made a further difficult start on a whole series of ideas which, however, impressed him differently. He realized that he had no need to make use of the transference in their case, but the influence of the first case had made all the others go into the transference.

[(*b*)] My mother's body naked. Two swords sticking into her breast from the side (like a decoration, he said later – following the Lucretia motif).[1] The lower part of her body and especially her genitals had been entirely eaten up by me and the children.

Source, easy. His cousin's grandmother (he scarcely remembers his own). He came into the room once as she was dressing and she cried out. I said that he must no doubt have felt curiosity about her body. In reply

[283] he told me a dream which he had at the time when he thought his cousin was too old for him. In it, his cousin led him up to the bedside of his grandmother, whose body and genitals were exposed, and showed him how beautiful she still was at ninety (wish fulfilment).

The two swords were the Japanese ones of his dreams: marriage and copulation. The meaning is clear. He had allowed himself to be led astray by a metaphor. *The content is the ascetic idea that a woman's beauty was consumed – eaten up*[2] *– by sexual intercourse and childbirth!* This time he himself laughed.

1 [Lucretia was the Roman matron who stabbed herself after being raped by Sextus Tarquinius. The scene has been a favourite subject for paintings; but the reference here remains obscure.]

2 [Doubly underlined in the MS.]

He had a picture of one of the deputy judges, a dirty fellow. He imagined him naked, and a woman was practising '*minette*' [*fellatio*] with him. Again my daughter! The dirty fellow was himself – he hopes soon to become a deputy judge himself, so as to be able to marry. He had heard of *minette* with horror; but once when he was with the girl in Trieste he pulled himself so far up her that it was an invitation for her to do it to him, but this did not happen. I repeated my lecture of last Saturday on the perversions.

Nov. 22. Cheerful, but became depressed when I brought him back to the subject. A fresh transference: My mother was dead. He was anxious to offer his condolences, but was afraid that in doing so an impertinent *laugh* might break out as had repeatedly happened before in the *case of a death*. He *preferred, therefore, to write a card with 'p.c.' on it*; and *this turned into a 'p.f.'* [p. 148 *n.* 2 above].

'Hasn't it ever occurred to you that if your mother died you would be freed from all conflicts, since you would be able to marry?' 'You are taking a revenge on me' he said. 'You are forcing me into this, because you want to revenge yourself on me.'

He agreed that *his walking about the room while he was making these confessions was because he was afraid of being beaten by me*. The [284] reason he had alleged was delicacy of feeling – that he could not lie comfortably there while he was saying these dreadful things to me. Moreover, he kept hitting himself while he was making these admissions which he still found so difficult.

'Now you'll *turn me out*.' It was a question of a picture of me and my wife in bed with a dead child lying between us. He knew the origin of this. When he was a little boy (age uncertain, perhaps five or six) he was lying between his father and mother and wetted the bed, upon which his father beat him and turned him out. The dead child can only be his sister Katherine, he must have gained by her death. The scene occurred, as he confirmed, after her death.

His demeanour during all this was that of a man in desperation and one who was trying to save himself from blows of terrific violence; he buried his head in his hands, rushed away, covered his face with his arm, etc. He confirmed to me that his father was irascible, and then did not know what he was doing.

Another horrible idea – of ordering me to bring my daughter into the room, so that he could lick her, saying 'Bring in the *Miessnik*'.[1] He

1 [A Yiddish term meaning 'ugly and disgusting fellow'.]

associated to this a story about a friend who wanted to bring up guns against the café that he used to visit but who wanted first to save the excellent and very ugly waiter with the words '*Miessnik*, come out'. He was a *Miessnik* compared with his younger brother. [p. 141 above.]

Also play on my name: '*Freudenhaus-Mädchen*' ['girls belonging to a House of Joy' – i.e. prostitutes].

Nov. 23. Next session was filled with the most frightful transferences, which he found the most tremendous difficulty in reporting. My mother was standing in despair while all her children were being hanged. He reminded me of his father's prophecy that he would be a great criminal
[285] [p. 199 above]. I was not able to guess the explanation he produced for having the phantasy. He knew, he said, that a great misfortune had once befallen my family: a brother of mine, who was a waiter, had committed a murder in Budapest and been executed for it. I asked him with a laugh how he knew that, whereupon his whole affect collapsed. He explained that his brother-in-law, who knows my brother, had told him this, as evidence that education went for nothing and that heredity was all. His brother-in-law, he added, had a habit of making things up, and had found the paragraph in an old number of the *Presse* [the well-known Vienna newspaper]. He was referring, as I know, to a Leopold Freud, the train murderer, whose crime dates back to my third or fourth year. I assured him that we never had any relatives in Budapest. He was much relieved and confessed that he had started the analysis with a good deal of mistrust on account of this.

Nov. 25. He had thought that if there were murderous impulses in my family, *I should fall upon him like a beast of prey* to search out what was evil in him. He was quite gay and cheerful today and told me that his brother-in-law was constantly making up things like this. He at once went on to discover the explanation – that his brother-in-law had not forgotten the stigma attached to his own family, for his father had fled to America on account of fraudulent debts. The patient thought that that was why he had not been made lecturer in botany at the university. A moment later he found the explanation of all his hostility to my family. His sister Julie had once remarked that *Alex* [Freud's brother] *would be the right husband for Gisa*. Hence his fury. (Just as with the officers. [p. 210 above.])

Next a dream. He was standing on a hill with a gun which he was training on a town which could be seen from where he was, surrounded by a number of horizontal, circular walls. His father was beside him and

they discussed the period in which the town was built – the ancient East or the German Middle Ages. (It was certain that it was not altogether real.) The horizontal walls then turned into vertical ones which towered upwards like rings made of thread. He tried to demonstrate something upon them, but the threads were not stiff enough and kept on falling down. Addendum; analysis. [286]

Nov. 26. He interrupted the analysis of the dream to tell me some transferences. A number of children were lying on the ground, and he went up to each of them and did something into their mouths. One of them, my son (his brother who had eaten excrement when he was two years old), still had brown marks round his mouth and was licking his lips as though it was something very nice. A change followed: it was I, and I was doing it to my mother.

This reminded him of a phantasy in which he thought that a badly behaved [female] cousin of his was not even worthy that Gisa should do her business into her mouth, and the image had then been reversed. Pride and high regard lay behind this. A further recollection that his father liked being coarse and loved using such words as '*arse*' and '*shit*', at which his mother always showed signs of being horrified. He once tried to imitate his father, and this involved him in a crime which went unpunished. He was a dirty pig, so once, when he was eleven, his mother decided to give him a thorough good wash. He wept for shame and said, 'Where are you going to scrub me next? On the arse?' This would have brought down the most severe chastisement on him from his father, if his mother had not saved him.

His family pride, to which he admitted with a laugh, probably went along with this self-esteem. 'After all, the Lorenzes are the only nice people,' said one of his sisters. His eldest brother-in-law had become used to it and joked about it. He would be sorry if he were to despise his brothers-in-law simply on account of their families. (Contrast between his own father and those of his brothers-in-law.) His father was a first cousin of his mother, both in very humble circumstances, and he used in a joking way to give an exaggerated picture of the conditions they lived in when they were young. His hatred of me, accordingly, was a special case of his hatred of brothers-in-law. [287]

Yesterday, after having come to the assistance of an epileptic, he was afraid of having an attack of rage. He was furious with his cousin and hurt her feelings by a number of innuendos. Why was he in a rage? Afterwards he had a fit of crying in front of her and his sister.

A further dream in connection with this.

(Aged 29.) A most wonderful anal phantasy. He was lying on his back on a girl (my daughter) and was copulating with her by means of the stool hanging from his anus. This pointed directly to Julie, to whom he said, 'Nothing about you would be disgusting to me'. During the night he had a severe struggle. He did not know what it was about. *It turned out to be about whether he should marry his cousin or my daughter*. This oscillation can easily be traced back to one between two of his sisters.

A phantasy that if he won the first prize in the lottery he would marry his cousin and spit in my face showed that he thought that I desired to have him as a son-in-law. – He was probably one of those infants who retain their faeces.

He had an invitation today to a rendezvous. The thought 'rats' at once occurred to him. In connection with this he told me that when he first met him, Lieutenant D., the stepfather, related how, when he was a boy, he went about firing a Flaubert pistol[1] at every living thing and shot himself or his brother in the leg. He remembered this on a later visit when he saw a large rat, but the lieutenant did not. He was always saying,
[288] 'I will shoot you'. Captain Novak must have reminded him of Lieutenant D., especially as he was in the same regiment as D. had been and the latter said, 'I ought to have been a captain by now'. – It was another officer who mentioned the name Gisela; Novak had mentioned the name Hertz [p. 208 above]. – D. is syphilitic, and it was on this account that the marriage broke down. The patient's aunt is still afraid of having been infected. *Rats* signify *fear of syphilis*.

Nov. 29. He has had a great deal of annoyance over money matters with his friends (giving security, etc.). He would dislike it very much if the situation turned in the direction of money. *Rats* have a special connection with money. When yesterday he borrowed two florins from his sister, he thought '*for each florin a rat*'. When at our first interview I told him my fees he said to himself, 'For each krone a rat for the children'. Now '*Ratten*' ['rats'] really meant to him '*Raten*' ['instalments']. He pronounced the words alike,[2] and he justified this by saying that the 'a' in '*ratum*' (from '*reor*') is short; and he was once corrected by a lawyer, who pointed out that '*Ratten*' and '*Raten*' are not the same. A year before, he had offered security for a friend who had to pay a sum of money in

1 [A well-known brand of firearm. The name should be spelt 'Flobert'.]

2 [Normally the 'a' in '*Ratten*' is pronounced short, and the 'a' in '*Raten*' long; the German '*Rate*' is derived from '*ratum*', past participle of the Latin '*reor*', 'I calculate'.]

twenty instalments, and had got the creditor to promise that he would let him know when each instalment fell due so that he should not become liable under the terms of the agreement to pay the whole amount in one sum. So that *money and syphilis* converge in 'rats'. He now pays in rats. – Rat *currency*.

Still more about syphilis. Evidently the idea of *syphilis gnawing and eating* had reminded him of rats. He in fact gave a number of sources for this, especially from his time of military service, where the subject was discussed. (Analogy with the transferences about genitals having been eaten up [p. 212 f. above].) He had always heard that all soldiers were [289]
syphilitic (hence dread of the officer mentioning the name Gisela).

Military life reminded him not only of D. but of his father, who was in the army so long. The idea that his father was syphilitic was not so unfamiliar to him. He had often thought of it. He told me a number of stories of his father's merry life while he was serving. He had often thought that the *nervous troubles of all of them might perhaps be due to his father having syphilis*.

The rat idea, as relating to his cousin, ran accordingly: Fear that she was infected by her stepfather; behind this, that she had been made ill by her own father, and behind this again the logical and rational fear that, being the *child of a general paralytic, she herself was diseased (he had known of this correlation for years)*. The outbreak of his illness after his uncle's complaint [p. 206] can now be understood in another way. It must have meant the fulfilment of a wish that his own father should also be syphilitic, so that he might have nothing to reproach his cousin with and might marry her after all.

Nov. 30. More rat stories; but, as he admitted in the end, he had only collected them in order to evade the transference phantasies which had come up in the meantime and which, as he saw, expressed remorse about the rendezvous due for today.

Postscript. His cousin and her uncle X. from New York, while they were on a railway journey, found a rat's tail in a sausage, and both of them vomited for hours. (Was he gloating over this?)

New material. Disgusting rat stories. He knows that rats act as carriers of many infectious diseases. In the Fugbachgasse there was a view over a courtyard into the engine house of the Roman baths. He saw them catching rats and heard that they threw them into the boiler. There were [290]
a lot of cats there, too, which made a fearful caterwauling, and once he saw a workman beating something in a sack against the ground. He

enquired and was told that it was a cat and that it was thrown into the boiler afterwards.

Other stories of cruelty followed, which finally centred on his father. The sight of the cat gave him the idea that his father was in the sack. When his father was serving with the army, corporal punishment was still in force. He described how he had once and once only, in a fit of temper, struck a recruit with the butt end of his rifle, and he had fallen down. His father had gone in a great deal for lotteries. One of his fellow soldiers was in the habit of spending all his money in this way; his father once found a bit of paper which this man had thrown away and on which two numbers were written. He put his money on these numbers and won on both of them. He drew his winnings while he was on the march and ran to catch up the column with the florins jingling in his cartridge pouch. What a cruel irony that the other man had never won anything! On one occasion, his father had ten florins of regimental money in his hands to meet certain expenses. He lost some of it in a game of cards with some other men, let himself be tempted to go on playing and lost the whole of it. He lamented to one of his companions that he would have to shoot himself. 'By all means shoot yourself,' said the other, 'a man who does a thing like this ought to shoot himself,' but then lent him the money. After ending his military service, his father tried to find the man, but failed. (*Did he ever pay him back?*)

His mother was brought up by the Rubenskys as an adopted daughter, but was very badly treated. She told how one of the sons was so sensitive that he cut off chickens' heads in order to harden himself. This was obviously only an excuse, and it excited him very much. – A dream image of
[291] a big fat rat which had a name and behaved like a domestic animal. This reminded him at once of one of the two rats (this was the first time he said there were only two) which, according to Captain Novak's story, were put in the pot. Furthermore, rats were responsible for his having gone to Salzburg. His mother related of the same Rubensky how he had once 'koshered' a cat by putting it in the oven and then skinning it. This made him feel so bad that his brother-in-law advised him in a friendly way to do something for his health. His attention is so much fixed on rats that he finds them everywhere. On the occasion when he returned from the manoeuvres, he found that Dr Springer[1] had a colleague with him whom he introduced as Dr Ratzenstein. The first performance he went to was the *Meistersinger*, where he heard the name of 'David' repeatedly called

1 [The friend who is mentioned at the beginning of the published case history (p. 123 above), and whom he visited on his return from the manoeuvres (p. 132).]

out. He had used the David motif as an exclamation in his family.[1] When he repeats his magic formula '*Glejsamen*' now he adds 'without rats', though he pictures it as spelt with one 't' [see p. 216 above]. He produced this material, and more besides, fluently. The connections are superficial and deeper ones are concealed; evidently he had prepared this as an admission, in order to cover something else. This material seems to contain the connection of *money* and *cruelty*, on the one hand with rats, and on the other with his father, and it must point towards *his father's marriage*. He told another anecdote. When, not many years ago, his father came back from Gleichenberg,[2] he said to his mother, after thirty-three years of married life, that he had seen such an incredible number of bad [292]
wives that he must beg her to assure him that she had never been unfaithful to him. When she objected, he said he would only believe her if she swore it on their children's lives; and after she had done so, he was pacified. He thinks highly of his father for this as a sign of his frankness, like his admission of ill-treating the soldier or his lapse over a card game. – There is important material behind this. The rat story becomes more and more a *nodal* point.

Dec. 8. Much change in the course of one week. His spirits rose greatly on account of his rendezvous with the dressmaker, though this ended in a premature ejaculation. Soon afterwards he became gloomy, and this came out in transferences in the treatment. During his meeting with the girl there were only slight indications of the rat sanction. He felt inclined to refrain from using the fingers that had touched the girl when he took a cigarette from the cigarette case given him by his cousin, but he resisted the inclination. More details about his father, his coarseness. His mother called him a 'common fellow' because he was in the habit of breaking wind openly.

Our pursuit of the treatment transference led along many devious paths. He described a temptation whose significance he seemed to be unaware of. A relative of Rubensky had offered to fit up an office for him in the neighbourhood of the cattle market as soon as he had got his doctor's degree – which was at the time only a few months off – and to find him clients there. This fitted in with his mother's old scheme for him to marry one of R.'s daughters, a charming girl who is now seventeen. He

1 [David was the real name of Lieutenant A. in the published case history (see p. 129 above), who was said to have paid the charges for the patient's pince-nez. The reference to the patient's family is obscure. The name occurs before in the 'Record' (p. 208), where, however, Freud says that the patient's father's name was *not* David, but Friedrich (a fact confirmed on p. 224).]

2 [The Styrian spa.]

had no notion that it was in order to evade this conflict that he took flight into illness[1] – a flight which was facilitated by the infantile problem of his choice between an elder and a younger sister and by his regression
[293] to the story of his father's marriage. His father used to give a humorous account of his courtship, and his mother would occasionally chaff him by telling how he had earlier on been the suitor of a butcher's daughter. It seemed to him an intolerable idea that his father might have abandoned his love in order to secure his future by an alliance with R. He developed great irritation with me, which was expressed in insults which it was highly distressing for him to utter. He accused me of picking my nose, refused to shake hands with me, thought that a filthy swine like me needed to be taught manners and considered that the postcard I had sent him, and had signed 'cordially', was too intimate.

He was clearly struggling against phantasies of being tempted to marry my daughter instead of his cousin, and against insults to my wife and daughter. One of his transferences was straight out that Frau Prof. F. should lick his arse – a revolt against a grander family. Another time he saw my daughter with *two patches of dung in the place of eyes. This means that he has not fallen in love with her eyes, but with her money*. Emmy [the girl his mother wanted him to marry] has particularly beautiful eyes. In recent days, he has stood up manfully against his mother's lamentation over his having spent 30 florins of pocket-money during the last month instead of 16.

The theme of the rats has lacked any element directed towards his mother, evidently because there is very strong resistance in relation to her. In equating '*Ratten*' and '*Raten*', he was, among other things, laughing at his father. His father had once said to his friend 'I am only a *Laue*' instead of a '*Laie*'.[2] This, like any other sign of his father's lack of education, greatly embarrassed him. His father made occasional attempts at economizing, along with efforts to institute a Spartan regime, but he always gave them up after a short time. It is his mother who is the eco-
[294] nomical one, but she sets store by comfort in the house. The way in which the patient secretly supports his friend is an identification with his father who behaved in just the same way to their first lodger, whose rent he used to pay, and to other people, too. In point of fact, he was a very genuine, downright, kindly man, with a sense of humour, and normally the patient thoroughly appreciated these qualities. Nevertheless, with

1 [See Freud (1909*a*), *RSE*, **9**, 203 *n*. 2.]

2 ['*Laie*' = layman; '*lau*' = 'tepid'.]

his over-refined attitude, he was manifestly ashamed of his father's simple and soldierly nature.

Dec. 9. Cheerful, is falling in love with the girl – talkative – a dream with a neologism, general staff map of WŁK (Polish word).[1] We must go into this tomorrow. Vielka = [in Polish] 'old',[2] L = Lorenz, Gl = abbreviation of Glejsamen [p. 211 above] = Gisela Lorenz.

Dec. 10. He told me the whole dream, but understands nothing about it; on the other hand he gave me a few associations to WŁK. My idea that this meant a WC not confirmed; but with W ['vay'] he associated a song sung by his sister '*In meinem Herzen sitzt ein grosses Weh*'[3] [also pronounced 'vay']. This had often struck him as very comic, and he could not help picturing a big W.

His defensive formula against compulsions is, he tells me, an emphatic '*aber*' ['but']. Recently (only since the treatment?) he has stressed it '*abér*' [the word is normally stressed '*áber*']. He said he had explained this wrong accentuation to himself as serving to strengthen the mute 'e' which was not a sufficient protection against intrusions. It now occurred to him that perhaps the '*abér*' stood for '*Abwehr*' ['defence'] where the missing W was to be found in the WŁK.

His formula 'Glejsamen', in which in a happy hour he fixed by a magic [295]
spell what was henceforth to continue unchanged, had held good, he said, for quite a time. But it was nevertheless exposed to the enemy, that is, a reversal into its opposite, and for that reason he endeavoured to shorten it still more, and had replaced it – for reasons unknown – with a short '*Wie*' ['how' pronounced as English 'vee'].

The K corresponds to the '*vielka*' [pronounced as English 'vee-ell-ka'] = 'old'. It also reminded him of his anxiety when at school the letter K [i.e. boys whose name began with a K] was being examined, since it meant that his L was getting very near. It would thus correspond to a wish that K should come after L, so that L would already be passed.

Great reduction in the patient's treatment transferences. He is much afraid of meeting my daughter. Quite unsuspectingly he told me that one of his testes was undescended, though his potency is very good. In a dream he had met a captain who had his badge of rank only on the right

1 [These letters would be pronounced in German like the English 'vay-ell-ka'.]

2 [The Polish word '*vielka*' in fact means 'big'.]

3 ['In my heart there sits a big sorrow.' (A misquotation from Heine: 'In meiner Brust, da sitzt ein Weh'. From *Buch der Lieder*, Junge Leiden, 'Der arme Peter'.)]

side and one of the three stars was hanging down. He pointed out the analogy with his cousin's operation [p. 165 above].

Dec. 12. His 'dirty' transferences continued and more are announced. He turns out to be a *renifleur*. In his youth he was able to recognize people by the smell of their clothes; he could distinguish family smells, and he got positive pleasure from the smell of women's hair. It further appears that he has made a transference of the unconscious struggle which made him fall ill, by displacing his love for his cousin on to the dressmaker; and he is now making the latter compete with my daughter, who figures as the rich and respectable match. His potency with the dressmaker is excellent. Today he ventured to tackle the subject of his mother. He had a very early recollection of her lying on the sofa; she sat up, took something yellow out from under her dress and put it on a chair.
[296] At the time he wanted to touch it; but, as he recollected it, it was horrible. Later the thing turned into a secretion, and this led to a transference of all the female members of my family being choked in a sea of revolting secretion of every kind. He assumed that all women had disgusting secretions and was astonished afterwards at finding they were absent in his two liaisons. His mother suffered from an abdominal affection and now has a bad smell from her genitals, which makes him very angry. She herself says that she stinks unless she has frequent baths, but that she cannot afford it, and this appals him.

He told me two charming stories of children. One was about a little girl of five or six who was very curious about Santa Claus. She pretended to be asleep and saw her father and mother filling shoes and stockings with apples and pears. Next morning she said to her governess, 'There's no Santa Claus. Daddy and Mummy do it. Now I don't believe in anything at all any more, not even in the stork. Daddy and Mummy do that, too.' The other story was about his little nephew aged seven. He is a great coward and is frightened of dogs. His father said to him, 'What would you do if *two* dogs came along?' 'I'm not afraid of two. They'd smell each other's bottoms so long that I'd have time to run away.'

Dec. 14. He is getting on well with the girl, for her naturalness pleases him and he is very potent with her; but it is clear from instances of less severe compulsion which he has brought up that a hostile current of feeling against his mother is present, which he is reacting to with exaggerated consideration for her and which is derived from her educational strictures, especially about his dirtiness. Anecdote of his

mother eructating; and he had said, aged twelve, that he could not eat on account of his disgust.

Dec. 16. While he was with the dressmaker he thought 'for every copulation a rat for my cousin'. This shows that rats are something which is [297]
countable. The sentence is the product of a compromise between friendly and hostile currents of feeling; for (*a*) every copulation of this kind paves the way for one with his cousin, and (*b*) every copulation is done in defiance of her and to make her angry.

The picture is made up of clear conscious ideas, phantasies, deliria [pp. 168–9 above], compulsive associations [*Zwangseinfällen*] and transferences.

He told me of a 'terrifying' experience in connection with the rat story. On one occasion, before he fell ill, while he was visiting his father's grave, he saw a beast like a rat gliding past it. (No doubt it was a weasel, of which there are so many there.) He assumed – as might seem very likely – that the creature had just been having a meal off his father. His ideas in his unconscious about survival after death are as consistently materialistic as those of the ancient Egyptians. This is bound up with his illusion after Captain N.'s speech about the rats that he saw the ground heave in front of him as though there was a rat under it, which he took as an omen. He had no suspicion of the connection.

Dec. 19. His miserliness is now explained. He was convinced, from a remark which his mother let fall to the effect that her connection with Rubensky was worth more than a dowry, that his father had married her and abandoned his love for his material advantage. This, together with his recollection of his father's financial embarrassment during his military service, made him detest the poverty which drives people into such crimes. In this way his low opinion of his mother found satisfaction. He economized, therefore, so as not to have to betray his love. For this reason, too, he hands over all his money to his mother, because he does not want to have anything from her; it belongs to her and there is no blessing on it.

He gets everything that is bad in his nature, he says, from his mother's side. His maternal grandfather was a brutal man who ill-treated his wife. [298]
All his brothers and sisters have, like him, gone through a great process of transformation from bad children to very worthy people. This was least true of his brother, who was like a parvenu.

Dec. 21. He has been identifying himself with his mother in his behaviour and treatment transferences. Behaviour: Silly remarks all day long, taking pains to say disagreeable things to all his sisters, critical comments on his aunt and cousin. Transferences: He had the idea of saying he did not understand me, and had the thought, '20 Kronen are enough for the *Parch*',[1] etc. He confirmed my construction by saying that he used identically the same words as his mother about his cousin's family. It seems likely that he is also identifying himself with his mother in his criticisms of his father and is thus continuing the differences between his parents within himself. In a dream (an old one) which he told me he drew a direct parallel between his own reasons for hating his father and his mother's: His father had come back. He was not surprised at this. (Strength of his wish.) He was immensely pleased. His mother said reproachfully, 'Friedrich, why is it such a long time since we've heard from you?' He thought that they would have to cut down expenses after all, as there would be an extra person living in the house now. This thought was in revenge against his father who, he had been told, was in despair over his birth, as he was over each new baby. Something else lay behind this, viz. that his father liked having his permission asked, as though he wanted to abuse his power, although perhaps he was really only enjoying the feeling that everything came from him. His mother's complaint went back to a story of hers that once, when she was in the country, he wrote so seldom that she came back to Vienna to see what was going on. In other words, a complaint at being badly treated.

[299] *Dec. 23.* Greatly upset by Dr Pr. falling ill again. Dr Pr.'s character is similar to his father's – a man of honour in spite of his roughness. The patient is going through just what he did when his father was ill. Incidentally, the illness is the same – emphysema. Moreover, his regrets are not unmixed with feelings of revenge. He can see that this is so, from phantasies of Pr. being dead already. The reason for these feelings may be his having been reproached for a long time in the family for not having insisted strongly enough on his father's retiring from work. The rat sanction extends to Pr. as well. It occurred to him that a few days before his father's death Pr. said that he himself was ill and intended to hand the case over to Dr Schmidt. This was evidently because the case was a hopeless one and affected him too deeply on account of his intimate friendship. At that time the patient had thought, 'The rats are leaving the sinking ship'. He had the notion that his wish was killing Pr. and that he

1 [A Yiddish term for a stupid, conceited, futile person.]

could keep him alive – an idea of his omnipotence. He thought that a wish of his had actually kept his cousin alive on two occasions. One of these was last year, when she suffered from sleeplessness and he stayed up all night and she in fact slept better for the first time that night. The other time was when she was suffering from her attacks; whenever she was verging on a state of insensibility, he was able to keep her awake by saying something that would interest her. She reacted, too, to his remarks even while she was in that state.

What is the origin of his idea of his omnipotence? I believe it dates back to the first death in his family, that of Katherine – about which he had three memories [p. 198 above]. He corrected and enlarged the first of these. He saw her being carried to bed, not by her father, and before it was known that she was ill. For her father was scolding and she was being carried away from her parents' bed. She had for a long time been complaining of feeling tired, which was disregarded. But once, when Dr Pr. was examining her, he turned pale. He diagnosed a carcinoma (?) to [300] which she later succumbed. While I was discussing the possible reasons for his feeling guilty of her death, he took up another point which was also important because here again he had not previously recalled his omnipotence idea. When he was twenty years old, they employed a dressmaker, to whom he repeatedly made aggressive advances but whom he did not really care for, because she made demands and had an excessive desire to be loved. She complained that people did not like her; she asked him to assure her that he was fond of her and was in despair when he flatly refused. A few weeks later she threw herself out of the window. He said she would not have done it if he had entered into the liaison. Thus one's omnipotence is manifested when one gives or withholds one's love, insofar as one possesses the power to make someone *happy*.

The next day he felt surprised that after making this discovery he had no remorse, but he reflected that it was, in fact, already there. (Excellent!)

He then proposed to give a historical account of his obsessional ideas. He had his first one in Dec., 1902, when he suddenly thought he must take his examination by a certain date, Jan., 1903, and this he did. (After his aunt's death and his self-reproaches on account of his father's strictures.) He understands this perfectly as being a deferred [*nachträgliches*] industriousness. His father had always been upset because he was not industrious. His idea was, accordingly, that if his father were alive he would be harmed by his laziness, and the same is true now. I pointed out to him that this attempt to deny the reality of his

father's death is the basis of his whole neurosis. In Feb., 1903, after the death of an uncle, about whom he felt indifferent, there was a fresh onset of self-reproaches for having slept through the night [of his father's death]. Extreme despair, suicidal ideas, horror at the thought of his own death. What, he wondered, did dying mean? It was as though the sound
[301] of the word must tell him. How frightful it must be not to see or hear or feel anything. He completely failed to notice his faulty conclusion and he escaped from these thoughts by assuming that there must be a next world and an immortality. During the summer of the same year, 1903, while he was in a boat crossing the Mondsee, he had a sudden idea of jumping into the water. He was coming back with Julie from a visit to Dr E. with whom she was in love. In the course of thinking what he would do for his father, he began by having a hypothetical idea, 'if you had to throw yourself into the water in order that no harm might come to him . . .', and this was at once followed by a positive command [to the same effect]. This was analogous, even in its actual phrasing, to his reflections before his father's death as to whether he would give up everything to save him. Hence there was some parallel with his cousin who had treated him badly for the second time during that summer. His fury against her had been tremendous, he remembers suddenly thinking as he lay on the sofa, 'she is a whore', which greatly horrified him. He no longer doubts that he had to expiate similar feelings of rage against his father. His fears were at that time already oscillating between his father and his cousin ('whore' seems to imply a comparison with his mother). *The command to jump into the water* can thus only have come from his cousin – he was her unsuccessful lover.

Dec. 27. He began with a correction. It was in Dec., 1902, that he told his friend of his self-reproaches. He took his examination in January and did not at that time give himself any fixed date, as he had wrongly thought; this did not happen till 1903, the date being for July.

In the spring [?1903] he felt violent self-reproaches (why?). A detail brought the answer. He suddenly fell on his knees, conjured up pious feelings and determined to believe in the next world and immortality. This involved Christianity and going to church in Unterach[1] after he had
[302] called his cousin a whore. His father had never consented to be baptized, but much regretted that his forefathers had not relieved him of this unpleasant business. He had often told the patient that he would make no objections if he wanted to become a Christian. Might it be, perhaps,

1 [In Upper Austria. The Mondsee is a lake close by.]

I asked, that a Christian girl had appeared just then as a rival to his cousin? 'No.' 'The Rubenskys are Jews, are they not?' 'Yes, and professing ones.' Indeed, if he had become a Christian it would have meant the end of the whole R. scheme. So, I replied, his kneeling must have been directed against the R. scheme and he must therefore have known of this plan before the scene of the kneeling. He thought not but admitted that there was something he was not clear about. What he definitely remembered was the termination of the scheme – his going with his cousin (and future brother-in-law) Bob St. to visit the R.s where the plan was mentioned of their being established near the cattle market, St. as a lawyer and he as his clerk. St. had insulted him over this. In the course of the conversation he had said, 'Mind you're ready by then'. It remains quite possible that his mother had told him of the scheme months before.

He told me that during the spring of 1903[1] he had been slack at his studies. He drew up a timetable, but only worked in the evening till twelve or one o'clock. He read for hours then, which he does not understand at all. Here he interpolated a recollection that ca. 1900 he had taken an *oath* never to masturbate again – the only one he remembers. At this time, however, he used often, after reading, to turn on a great deal of light in the hall and closet, take off all his clothes and look at himself in front of the looking-glass. He felt some concern as to whether his penis was too small, and during these performances he had some degree of erection, which reassured him. He also sometimes put a mirror between his legs. Moreover, he used at that time to have an illusion that someone was knocking at the front door, that it was his father trying to get into the [303]
apartment, and that if the door was not opened he would feel that he was not wanted and would go away again. He thought he often came and knocked. He went on doing this till at last he got frightened at the pathological nature of this idea and freed himself from it by the thought 'If I do this, it will do my father harm'.

All of this was disconnected and unintelligible. It falls into place if we suppose that for superstitious reasons he expected a visit from his father between 12 and 1 a.m. and thus arranged to do his work at night so that his father should come upon him while he was working; but that then – after inserting an isolating interval and of waiting, during a possibly uncertain time – he carried out what he himself regarded as a substitute for masturbation, and thus defied his father. He confirmed the first of these points, and as regards the second, said he had a feeling as though it

1 [The year is unclear in the MS.; it appears to be a 1 changed into a 3.]

were connected with some obscure childhood memory, which, however, did not emerge.

On the evening before he started for the country, at the beginning or middle of June, there occurred the scene of farewell with his cousin who had come home with X., in which he felt he had been disowned by her. During the first weeks of his stay in Unterach he peered through the cracks in the wall of the bathing-cabin and saw a quite young girl naked. He suffered the most distressing self-reproaches, wondering how it would affect her if she was aware of being spied upon.

This consecutive account of events swallowed up any reference to current happenings.

Dec. 28. He was hungry and was fed.[t]

Continuation of his story. Compulsion at Unterach. It suddenly occurred to him that he must make himself *slimmer*. He began to get up from table – of course he left his pudding – and to run about in the sun
[304] till he dripped with perspiration. Then he would pause and afterwards have further bouts of running. He dashed up mountains in this way, too. On the edge of a steep precipice he had the idea of *jumping over*. This would of course have meant his death. He went on to a memory of his military service. When serving as a volunteer, he had not found mountain-climbing easy. During winter manoeuvres on the Exelberg[1] he lagged behind, and he tried to spur himself on by imagining that his cousin was standing at the hilltop and waiting for him. But this failed in its effect and he continued to lag behind until he joined the men who had fallen out. He thought that during his military service – in the year in which his father died – his first obsessions were all hypothetical: 'If you were to do something insubordinate.' He pictured situations as though to take the measure of his love of his father. If he was marching in the ranks and saw his father collapse before his eyes, would he fall out and run up to him to help him? (Recollection of his father pocketing his winnings and running to catch up [p. 218 above].) The origin of this phantasy was passing his home on a march from the barracks. During the first difficult weeks after his father's death he had been unable to see his people, as at that time he was confined to barracks for three weeks. He had not got on well in the army. He was apathetic and ineffective, and he had a lieutenant who was a bully and who struck them with the flat of his sword if they failed to execute certain movements. Recollection that St. once nerved himself to the pitch of saying 'We can manage without

1 [A hill in the Vienna Woods.]

the sword, sir'. The man shrank away but then came up to him and said, 'Next time I shall bring along a horsewhip'. The patient had to suppress a great deal of rage over this; he had many phantasies of challenging him to a duel, but gave it up. In some ways he was glad that his father was no longer alive. As an old soldier he would have been very much upset. His father had provided him with an introduction. When the patient showed [305] him a list of his officers his father recognized one of the names – the son of an officer under whom he himself had served – and wrote to him. There followed a story of this officer's father. Once, when, at Pressburg, the train could not enter the station owing to a heavy fall of snow, the patient's father armed the Jews with spades, though they were as a rule forbidden access to the market. The officer who was in charge of the commissariat at that time came up to him and said, 'Well done, old comrade, that was a good job', whereupon his father retorted 'You rotter! You call me "old comrade" now because I have helped you, but you treated me very differently in the past.'

(There is evidently an effort to please his father by running.)

Another compulsion at Unterach under the influence of his being disowned by his cousin: compulsion to talk. As a rule he does not talk much to his mother, but now he forced himself while he was on a walk with her to talk incessantly. He passed from one point to another and talked a lot of nonsense. He spoke of it as a general thing, but the example he gave showed that it started from his mother. – A common obsession for counting, e.g. counting up to 40 or 50 between thunder and lightning [p. 195 above]. – A kind of obsession for protecting. When he was with his cousin in a boat in a stiff breeze he had to put his cap on her head. It was as though he had a command that nothing must happen to her. – *Obsession for understanding*. He forced himself to understand every syllable spoken to him, as though he might be missing some priceless treasure. So he kept asking: 'What was it you said?' and when it was repeated, it seemed to him that it sounded different the first time and he was very importunate.

This material needs to be brought into relation with his cousin. She had explained to him that what he had regarded as her discouraging him had really been an attempt on her part to protect him from looking ridiculous in front of X. This explanation must have altered the situation [306] fundamentally. The obsession for protecting evidently expressed remorse and penance. The obsession for understanding also went back to the same situation; for it was these words of hers which had been so precious to him. Actually he had not had this last obsession before his cousin's

arrival. It is easy to understand how it became generalized. The other forms of obsession had been there before the *éclaircissement* with his cousin, as he remembers. His *counting anxiety* in thunderstorms was in the nature of an oracle, and points to a fear of death – *the number of years he would live*. Again, his running about in the sun had something suicidal about it, on account of his unhappy love. All of this he confirmed.

Before he left Unterach he told his friend Y. that this time he had a *strangely definite feeling* that he would not get back to Vienna. From his childhood he has been familiar with clear ideas of suicide. For instance, when he came home with bad school reports which he knew would pain his father. Once, however, when he was eighteen, his mother's sister was visiting them. Her son had shot himself eighteen months earlier on account of an unhappy love affair, it was said, and the patient thought that it was still because of Hilde, with whom the young man had been very much in love at one time, that he had killed himself. This aunt looked so miserable and broken that he swore to himself that, on his mother's account, he would never kill himself whatever happened to him, even if he were disappointed in love. His sister Constanze said to him after he had come back from his run, 'You'll see, Paul, one of these days you'll have a stroke.'

If he had suicidal impulses before the *éclaircissement* they can only have been self-punishments for having wished his cousin dead in his rage. I gave him Zola's *Joie de vivre* to read.[1]

[307] He went on to tell me that on the day on which his cousin left U. he found a stone lying in the roadway and had a phantasy that her carriage might hit up against it and she might come to grief. He therefore put it out of the way, but twenty minutes later it occurred to him that this was absurd and he went back in order to replace the stone in its position. So here again we have a hostile impulse against his cousin remaining alongside a protective one.

Dec. 2.[2] Interruption owing to Dr Pr.'s illness and death. He treated him like his father, and so arrived at personal relations with him, in which all sorts of hostile elements emerged. Rat wishes, derived from the fact that he was their family doctor and was paid money by them. 'So many kreuzers, so many rats', he said to himself, as he put money into the collection plate at the funeral. By identifying himself with his mother, he even

1 [The hero of this novel was perpetually occupied with thoughts of his own and other people's death.]

2 [So in the MS.]

found grounds for personal hatred against him; for she had reproached him for not having persuaded his father to retire from business. On the way to the cemetery he once again found himself smiling in the strange way which always disturbed him when he attended funerals. He also mentioned a phantasy of Dr Pr. assaulting his sister Julie sexually. (This was probably envy over medical examinations.) He went on to a memory that his father must have done something he shouldn't have to her when she was ten.[1] He heard screams from the room and then his father came out and said: 'That girl has an arse like a rock.' Strangely enough, his belief that he really nourished feelings of rage against his father has made no progress in spite of his seeing that there was every logical reason for supposing that he had those feelings.

Connected with this, though it is not clear at what point, there was a transference phantasy. Between two women – my wife and my mother – a herring was stretched, extending from the anus of one to that of the other. A girl cut it in two, upon which the two pieces fell away (as [308]
though peeled off). All he could say at first was that he disliked herrings intensely; when he was fed recently [cf. p. 228 above] he had been given a herring and left it untouched. The girl was one he had seen on the stairs and had taken to be my twelve-year-old daughter.

Jan. 2 [*1908*]. (Undisguised expression.) He was surprised at having been so angry this morning when Constanze had invited him to go to the play with her. He promptly wished her the rats and then began to have doubts as to whether or not he should go and as to which of the two decisions would be giving way to a compulsion. Her invitation had upset a rendezvous with the dressmaker and a visit to his cousin, who is ill (these were his own words). His depression today must be due to his cousin's illness.

Besides this he apparently had only trivialities to report and I was able to say a great deal to him today. While he was wishing Constanze the rats he felt a rat gnawing at his own anus and had a visual image of it. I established a connection which throws a fresh light on the rats. After all, he had had worms. What had he been given against them? 'Tablets.' Not enemas as well? He thought he remembered that he had certainly had them too. If so, no doubt he must have objected to them strongly, since a repressed pleasure lay behind them. He agreed to this, too. Before this he must have had a period of itching in his anus. I told him that the story about the herring reminded me very much of the enemas. (He had just

1 [MS. unclear; possibly sixteen.]

before used the phrase '*wächst ihm zum Hals heraus*'. ['He was fed up with it.' Literally 'it grew out through his throat'.]) Had he not had other worms besides – tapeworms – for which people give you herrings, or heard of this at least? He did not think so, but went on about worms. (While he was in Munich he found a large roundworm in his stool, after
[309] having had a dream of standing on a springboard which was turning round with him in a circle. This corresponded to the movements of the worm. He had an irresistible call to defaecate immediately after waking.) Once when he was ten he saw his boy cousin defaecating and the latter showed him a big worm in his stool; he was very much disgusted. With this he associated what he described as the greatest fright of his life. When he was rather less than six, his mother had a stuffed bird from a hat, which he borrowed to play with. As he was running along with it in his hands, its wings moved. He was terrified that it had come to life again, and threw it down. I thought of the connection with his sister's death – this scene certainly took place later – and I pointed out how his having thought this (about the bird) made it easier for him to believe afterwards in his father's resurrection.

As he did not react to this, I gave another interpretation of it, namely as an erection caused by the action of his hands. I traced a connection with death from his having been threatened with death at a prehistoric period if he touched himself and brought about an erection of his penis, and suggested that he attributed his sister's death to masturbating. He entered into this to the extent of wondering at his never having managed to masturbate at puberty, in spite of having been troubled with such constant erections even as a child. He described a scene in which he actually showed his mother an erection. He summed up his sexuality as having been content with merely *looking* at [Fräulein] Peter and other women. Whenever he thought of an attractive woman without any clothes on he had an erection. A clear recollection of being in the women's swimming-bath and seeing two girls of twelve and thirteen whose thighs pleased him so much that he had a definite wish for a sister with such lovely thighs. Then followed a homosexual period with male friends; but there was never mutual contact but only looking and at the
[310] most pleasure from it. Looking took the place of touching for him. I reminded him of the scenes in front of the looking-glass after he had been studying at night [p. 227 above], in which, according to the interpretation, he had masturbated in defiance of his father, after studying in order to please him – in just the same way as his 'God protect him' was followed by a 'not'. We left it at that.

He went on to tell me the worm dream he had had in Munich, and then some information about his rapid stool in the morning, which connected with his transference phantasy about the herring. As an association to the girl who performed the difficult task [of cutting the herring in half] with 'easy virtuosity', he thought of Mizzi Q., a charming little girl who was eight years old at the time when he saw a good deal of her family, and before he himself had got his doctor's degree. He was taking the 6 a.m.[1] train to Salzburg. He was very grumpy because he knew he would soon want to defaecate and when, in fact, he felt the urge he made an excuse and got out in the station. He still reached the train, and Frau Q. caught him as he was adjusting his clothes. All the rest of the day he felt disgraced in her eyes. At this point he thought of a bull and then broke off. He went on to an ostensibly irrelevant association. At a lecture given by Schweninger and Harden[2] he met Professor Jodl, whom he greatly admired at that time, and actually exchanged a few words with him. But Jodl stands for bull,[3] as he very well knows. Schönthan[4] had written an article at about that time describing a dream in which he was Schweninger and Harden rolled into one, and thus was able to answer all the questions put to him till someone asked him why fishes have no hair. He sweated with fear till an answer occurred to him and he said it was of [311]
course well known how greatly scales interfere with the growth of hair and that was why fishes could not have any. This is what determined the appearance of the herring in the transference phantasy. Once when he had told me that his girl had lain on her stomach and her genital hairs were visible from behind, I had said to him that it was a pity that women nowadays gave no care to them and spoke of them as unlovely; and for that reason he was careful that the two women [in the phantasy] should be without hair.

My mother seems to have stood for his grandmother, whom he had never known himself, but he thought of his cousin's grandmother. A house run by two women. When I brought him something to eat he thought at once that it had been prepared by two women [p. 228 above].

Jan. 3. If the *rat is a worm*, it is also a penis. I decided to tell him this. If

1 [The number is unclear in the MS.; it could be a 4.]

2 [Ernst Schweninger (Bismarck's doctor) and Maximilian Harden (the famous German journalist) delivered a lecture jointly in dialogue form on Feb. 5, 1898, in Vienna, on the subject of medicine. No doubt Schönthan's article mentioned below was in the nature of a parody of this lecture.]

3 [Jodl was Professor of Philosophy in Vienna.]

4 [Well known at the time in Vienna as a writer of light comedies.]

so, his formula is simply a manifestation of a libidinal urge towards sexual intercourse – an urge characterized both by rage and desire and expressed in archaic terms (going back to the infantile sexual theory of intercourse by the anus). This libidinal urge is as double-sided as the Southern Slav curse of arse-fucking [p. 164 above]. Before this he told me, in high spirits, the solution of the last phantasy. It was my science that was the child which solved the problem with the gay superiority of 'smiling virtuosity', peeled off the disguises from his ideas and so liberated the two women from his herring wishes.

After I had told him that a rat was a penis, via worm (at which point he at once interpolated 'a little penis') – rat's tail, tail[1] – he had a whole flood of associations, not all of which belonged to the context and most of them coming from the wishful side of the structure. He produced
[312] something in reference to the prehistory of the rat idea which he had always regarded as connected with it. Some months before the rat idea was formed he met a woman in the street whom he at once recognized as a prostitute or at all events as someone who had sexual relations with the man who was with her. She smiled in a peculiar way and he had a strange idea that his cousin was inside her body and that her genitals were placed behind the woman's in such a way that she got something out of it every time the woman copulated. Then his cousin, inside her, blew herself out so that she burst her. Of course this can only mean that the woman was her mother, the patient's Aunt Laura. From these thoughts, which made her not much better than a whore, he finally went on to her brother, his Uncle Alfred, who insulted her straight out and said, 'You powder your face like a *chonte*'.[2] This uncle died in frightful pain. After his inhibition he frightened himself with the threat that he himself would be punished in the same way for these thoughts of his. Next came various ideas of having actually wished that his cousin should have sexual intercourse; this had been before the rat theory with its occasional form of having to attack her with rats. Further, a number of connections with money, and the idea that it had always been his ideal to be in a state of sexual readiness, even immediately after copulating. Perhaps he was thinking of a transposition into the next world? Two years after his father's death his mother told him that she had sworn on his father's grave that in the immediate future she would, by economizing, replace the capital which had been spent.

1 [The German '*Schwanz*', like its English equivalent 'tail', is often used as a vulgar expression for 'penis'. See above, p. 12.]

2 [Yiddish slang word for 'prostitute'.]

He did not believe that she had taken the oath, but this was the chief motive for his own economizing. Thus he had sworn (in his usual way) that he would not spend more than 50 florins per month in Salzburg. Later he made the inclusion of the words 'in Salzburg' uncertain, so that he might *never* be able to spend more, and *never* be able to marry his cousin. (Like the whore phantasy,[1] this could be traced back via Aunt [313] Laura to the hostile current of feeling towards his cousin.) He had another association, however, to the effect that he need not marry his cousin if she only offered herself to him without marriage, and against this, in turn, the objection that if so he would have to pay for every copulation in florins as with the prostitute. Thus he came back to the germ of his delirium of 'so many florins, so many rats': i.e. '*so many tails (copulations), so many florins*'.

Of course, the whole whore phantasy goes back to his mother – the suggestions made when he was twelve years old by his boy cousin who maliciously told him that his mother was a whore and made signs like one [p. 208 f. above]. His mother's hair is now very thin, and while she combs it he is in the habit of pulling it and calling it a *rat's tail*. – When he was a child, while his mother was in bed once, she happened to move about carelessly and showed him her behind; and he had the thought that marriage consisted in people showing each other their bottoms. In the course of homosexual games with his brother he was horrified once when, while they were romping together in the bath, his brother's penis came into contact with his anus.

Further, many uninterpretable ideas as well as several hostile transferences against me.

Jan. 4. Cheerful. A large number of further associations, transferences, etc., which we did not interpret for the moment. In connection with the child (my science) who cleared up the herring connection, he had a phantasy of kicking it, and afterwards of his father smashing a window-pane. Bearing on this he told me an anecdote which gave a reason for his grudge against his father. When he missed his first Scripture lesson at his secondary school and clumsily denied the fact, his father was very much put out, and when the patient complained of Hans [his brother] hitting him, his father said, 'Quite right, too; give him a kick.' Another kicking anecdote, about Dr Pr. The patient's brother-in-law Bob St. hesitated a long time between Julie and Dr Pr.'s daughter, whose married name is [314]

1 [*Hurenphantasie*. Mistranscribed as *Herringsphantasie* in both the German editions, and hence in the English translations.]

now Z. When a decision had to be made, he was called to a family council and he advised that the girl, who loved him, should put the direct question to him of whether or not. Dr Pr. said [to her]: 'Very well, if you love him, that's all right. But if tonight' (after her rendezvous with him) 'you can show me the mark of his bottom on the sole of your shoe I'll give you a kiss.' He did not like him at all. It suddenly occurred to the patient that this marriage story was closely connected with his own Rub. temptation. Pr.'s wife was a Rubensky by birth, and if Bob had married his daughter he would have been the only candidate for the support of the Rubensky family. Continuing about his brother-in-law Bob, he [the patient] said that he [Bob] was very jealous of him. Yesterday there had been scenes with his sister in which he had said this straight out. Even the servants said that she loved him and kissed him [the patient] like a lover, not like a brother. He himself, after having been in the next room with his sister for a while, said to his brother-in-law: 'If Julie has a baby in nine months' time, you needn't think I am its father; I am innocent.' He had already thought that he ought to behave really badly, so that his sister should have no reason for preferring him in making a choice between husband and brother.

I had told him earlier, by way of clearing up a transference, that he was playing the part of a bad man in relation to me – that is to say, the part of his brother-in-law. This meant, I said to him, that he was sorry not to have Julie as his wife. This transference was the latest of his deliria about behaving badly and he brought it out in a very complicated form. In this transference he thought that I made a profit out of the meal I had given him [p. 228 above]; for he had lost time through it and the treatment would last longer. As he handed me my fee the thought occurred to him that he ought to pay me for the meal as well, namely 70 Kronen. This
[315] was derived from a farce at a Budapest music hall, in which a weakly bridegroom offered a waiter 70 Kronen if he would undertake the first copulation with the bride instead of him.

There were signs that he was afraid that the comments made by his friend Springer about the treatment might make him antagonistic to it. He said that whenever I praised any of his ideas he was always very much pleased; but that a second voice went on to say, 'I snap my fingers at the praise', or, more undisguisedly, 'I shit on it'.

The sexual meaning of rats did not come up today. His hostility was far clearer, as though he had a bad conscience about me. His young woman's pubic hairs reminded him of a mouse's skin, and this mouse seemed to him to have something to do with rats. He did not realize that

this is the significance of the pet name '*Mausi*', which he himself uses. When he was fourteen, a depraved boy cousin had shown him and his brother his penis and had said, 'Mine houses in a virgin forest' ['*Meiner hauset in einem Urwald*'], but he had taken him to say 'catches mice [or rats]' ['*mauset*'].

Jan. 6 and 7. He was smiling with sly amusement, as though he had something up his sleeve.

A dream and some scraps. He dreamt that he went to the dentist to have a bad tooth pulled out. He pulled one out, but it was not the right one, but one next to it which only had something slightly wrong with it. When it had come out he was astonished at its size. (Two addenda later.)

He had a carious tooth; it did not ache, however, but was only slightly tender, sometimes. He went to the dentist once to have it filled. The dentist, however, said there was nothing to be done except to extract it. He was not usually a coward, but he was kept back by the idea that somehow or other his pain would damage his cousin, and he refused to have it done. No doubt, he added, he had had some slight sensations in the tooth, which led to the dream.

But, I said, dreams can disregard stronger sensations than these and [316]
even actual pain. Did he know the meaning of tooth dreams? He vaguely remembered that it was something to do with the death of relatives. 'Yes, in a certain sense. Masturbation dreams involve a transposition from a lower to an upper part of the body.' 'How is that?' 'Linguistic usage likens the face to the genitals.' 'But there are no teeth down below.' I made him see that that was precisely why, and I told him, too, that pulling a branch off a tree has the same meaning. He said he knew the phrase 'pulling one down'.[1] But, he objected, he had not pulled out his tooth himself, but had had it pulled out by someone else. He admitted, however, that with the dressmaker he has felt a temptation to get her to take hold of his penis and has known how to bring this about. When I asked him whether he was already getting bored with her he replied 'Yes', with astonishment. He confessed that he was afraid she would ruin him financially and that he was giving her what was rightfully due to his lady-love. It came out he had behaved very carelessly in his money matters. He had not been keeping accounts, so that he did not know how much a month she was costing him; he had also lent his friend 100 florins.

1 [In German a vulgarism for masturbating. This and the other points above in connection with tooth dreams are entered into fully in *The Interpretation of Dreams* (Freud, 1900*a*; *RSE*, **5**, 346–7). This whole passage was added to the work in 1909, and it seems probable that it was to some extent at least based on the present dream.]

He admitted that I had caught him out on the high road to making himself dislike his liaison and to going back to abstinence. I said I thought that this was susceptible to other interpretations, but I would not tell him what. What could be the meaning of its not having been the right tooth?

Jan. 7. He himself had a feeling that his sly illness had something up its
[317] sleeve. He had been nice to the dressmaker again. His second copulation did not succeed in producing an emission; he was overtaken by a fear that he would micturate instead of having an emission. When he was a child in the fifth form of his primary school, one of his schoolfellows had told him that human reproduction was effected by the man 'piddling' into the woman. He had forgotten his condom. He is clearly looking for ways of spoiling his affair (having uncomfortable feelings?), e.g. by *coitus interruptus* – impotence.

Yesterday he had an addendum to the dream. The tooth did not look at all like one, but like a tulip bulb ['*Zwiebel*'], to which he gave the association of slices of onion [also '*Zwiebel*']. He did not accept the further associations of 'orchids' – his cryptorchism [undescended testis, cf. p. 221 above] – his cousin's operation [cf. p. 165]. In connection with the operation he told me that he was beside himself with jealousy at the time. While he was with her at the nursing home (in 1899) a young doctor visited her on his round and put his hand on her under the bedclothes. He did not know whether this was a correct thing to do. When he heard how brave she had been under the operation he had the foolish idea that that had been so because she enjoyed showing the beauty of her body to the doctors. He was astonished that I did not consider the idea so foolish.

He had heard of this beauty, when he fell in love with her in 1898, from his sister Hilde. This made all the more impression on him since Hilde herself has a very lovely body. This may have been the root of his love. His cousin had understood perfectly well what they were talking about and had blushed. The dressmaker T., who killed herself later, said she knew that he regarded his cousin officially as the most beautiful of women, although he really knew quite well that there were other, more beautiful ones.

Yes, the tooth was a penis, he realized that. Then there was another addendum: the tooth had dripped. – Well, then, what was the meaning
[318] of the dentist having pulled out his 'tooth'? It was only with difficulty that he could be brought to see that it was an operation for pulling out his tail. So, too, with the other obvious fact – that the very large penis could only be his father's; he finally admitted this as being a *tu quoque*

and a revenge against his father. Dreams have great difficulty in bringing to light such disagreeable memories.[1]

Jan. 20. A long interruption. Most cheerful mood. A great deal of material. Advances. No solution. A chance explanation showed that his running about so as to avoid getting fat ['*dick*'] was related to the name of the American cousin, *Dick* (short for Richard) – *Passwort*[2] – whom he hated [see pp. 144–5 above]. But this idea came from me and he did not accept it. Five dreams today, four of which dealt with the army. The first of these revealed a restrained rage against officers and his controlling himself so as not to challenge one of them for hitting the dirty waiter Adolph on his behind. (This Adolph was himself.) This led up to the rat scene via the lost pince-nez (nippers ['*Kneifer*']).[3] This also touched on an experience in his first year at the university. He was suspected by a friend of 'funking' ['*Kneifen*'], because he had allowed himself to have his ears boxed by a fellow student, had challenged him to a duel on Springer's joking advice, and had then done nothing further. There was suppressed anger against his friend Springer, whose authority thus originates from this, and against another man who betrayed him and whom, in return, he had later helped at the cost of sacrifices. Thus we find ever-increasing suppression of the drive to anger, accompanied by a return of the erotogenic drive for dirt.

[Here the MS. breaks off.]

1 [Grubrich-Simitis (1993) discovered among Freud's unpublished papers a fragment of a note dated January 13, 1908, recording a dream accompanied by reflections on its transference significance, which evidently stems from the 'Rat Man'. The dream was included in a collection of the type of 'absurd dreams' of dead people which Freud commented upon in footnotes added to *The Interpretation of Dreams* in 1909 and 1911, and he incorporated it into the main body of the text from 1930. The dream is specifically of the type in which the person is treated to begin with as though he were alive, and he then suddenly turns out to be dead (1900*a*), *RSE*, **5**, 384–5. An examination of the MS. of the original record of the 'Rat Man' case convinced Grubrich-Simitis that this note of January 13 was not detached from the original record but rather kept separate from the outset, presumably because Freud considered it independently significant for his dream book. Indeed, the fragment of paper in question carries the heading: 'How people dream of a dead person – absurd' (Grubrich-Simitis, 1993, 147; trans., 109–10).]

2 [Literally 'pass-word'. Freud is perhaps using this in the sense of 'verbal bridge' (cf. p. 163 above).]

3 [The explanations of 'dick' and 'Kneifer' were reported by Freud two days later (on January 22, 1907) at a meeting of the Vienna Psychoanalytical Society.]

APPENDIX

SOME WRITINGS BY FREUD DEALING WITH ANXIETY AND PHOBIAS IN CHILDREN AND WITH OBSESSIONAL NEUROSIS

The two main topics of the case histories in this volume were, of course, touched upon repeatedly by Freud. The following lists, however, include some of the chief passages in which they were more specifically discussed. The date at the beginning of each entry is that of the year during which the work in question was probably written. The date at the end is that of publication; and under that date fuller particulars of the work can be found in the Bibliography which follows.

(A) ANXIETY AND PHOBIAS IN CHILDREN

1909 'Analysis of a Phobia in a Five-Year-Old Boy.' (1909*b*.) [319]
1913 *Totem and Taboo* (Essay IV, Section 3). (1912–13*a*.)
1914 'From the History of an Infantile Neurosis.' (1918*b*.)
1917 *Introductory Lectures on Psychoanalysis* (Lecture XXV). (1916–17*a*.)
1926 *Inhibitions, Symptoms and Anxiety* (Chapters IV, VII and VIII). (1926*d*.)

(B) OBSESSIONAL NEUROSIS

1894 'The Neuropsychoses of Defence' (Section II). (1894*a*.)
1895 'Obsessions and Phobias.' (1895*c*.)
1895 'Mechanism of Obsessional Ideas and Phobias.' (1895*b*.)
1895 Draft 'K' (Fliess Correspondence). (1950*a*.)
1896 'Further Remarks on the Neuropsychoses of Defence' (Section II). (1896*b*.)
1904 Review of Löwenfeld's *Psychical Compulsive Phenomena*. (1904*f*.)
1907 'Obsessive Actions and Religious Practices.' (1907*b*.)
1908 'Character and Anal Erotism.' (1908*b*.)
1909 'Notes upon a Case of Obsessional Neurosis.' (1909*d*.) [320]
1912 *Totem and Taboo* (Essay II, Sections 2 and 3 (*c*), and Essay III, Sections 3 and 4). (1912–13*a*.)
1913 'The Disposition to Obsessional Neurosis.' (1913*i*.)
1914 'From the History of an Infantile Neurosis' (Section VI). (1918*b*.)
1916 'A Mythological Parallel to a Visual Obsession.' (1916–17*b*.)
1917 *Introductory Lectures on Psychoanalysis* (Lecture XVII). (1916–17*a*.)
1917 'On Transformations of Drive as Exemplified in Anal Erotism.' (1916–17*e*.)
1926 *Inhibitions, Symptoms and Anxiety* (Chapters V and VI). (1926*d*.)

BIBLIOGRAPHY

[Titles of books and periodicals are in italics; titles of papers are in inverted commas. Abbreviations are in accordance with the *World List of Scientific Periodicals* (London, 1963–5). Further abbreviations used in this volume can be found in the List at the end of this bibliography. Numerals in bold type refer to volumes; ordinary numerals refer to pages. In the case of the Freud entries, the letters attached to the dates of publication are in accordance with the corresponding entries in the complete bibliography of Freud's writings in the last volume of the *Revised Standard Edition*.

GENERAL INDEX

Abraham, *K.* (*see also* Bibliography), 75 *n.* 1
Absurdity
  in dreams, 166 *n.* 1
  in obsessional thought, 126–7, 166 *n.* 1
Adige, River, 199
Adler, *A.* (*see also* Bibliography), 82, 106–7, 123 *n.* 2
Adults, psychoanalysis of, 5–6, 7 *n.* 3, 27–8, 78–80, 108–9, 111–12
Affects
  displacement of, 134–5, 150–1
  distressing, in obsessional neurosis, 125–6, 135–6, 144, 168–9
  energy discharged in, 186
  regression of, on to residues of childhood, 152 *n.* 2
  transformed into anxiety, 27, 104
  withdrawal of, in obsessional neurosis, 150, 176
Aggressive drive, *Adler's* theory of, 106–7
Aggressiveness
  in '*Little Hans*', 13, 15, 33, 68, 85, 86, 102–7
  in '*Rat Man*', 145, 157–9, 165–6, 172, 193, 209–10, 215, 226, 229, 230–1, 234
Agoraphobia, 88
Aichhorn, *A.*, 111 *n.* 1
Alcibiades, 182 *n.* 1
Alexander, *F.* (*see also* Bibliography), 7 *n.* 3
Ambivalence, 33 *n.* 1, 34–5, 86–7, 102–3, 138–9, 146–9, 179–83, 184–5
Amnesia, 26 *n.* 2, 113, 127, 150, 176
Amphigenic phase, 84 *n.* 1
Anal
  erotism, 82–3, 128, 162–3, 187 *n.* 1, 208, 215, 231–2
  theory of birth, 53 *n.* 1, 57, 67, 73, 81, 98, 100, 102, 167
  theory of sexual intercourse, 234
Analogies
  agents provocateurs, 196–7
  excavation of Pompeii, 136
  German courts of justice, 179
  houses moved from one site to another, 186
  police and murderer, 135
  preservation of objects under Pompeii, 136
  River Adige, 199
Andreas-Salomé, *L.* (*see also* Bibliography), 7 *n.* 3
Animals and the sexual curiosity of children, 8, 11–12, 26–7, 81–2, 107 *n.* 3
Animate and inanimate differentiated by '*Little Hans*', 8, 10 *n.* 1, 12, 81
Anthropophyteia, 164 *n.* 1
Anti-Semitism, 28 *n.* 2
Anxiety, neurotic (*see also* Fear; Phobias)
  Adler's theory of, 106–7
  affect transformed into, 27, 104–5
  ambivalent feelings as source of, 34–5
  castration complex and, 77
  displacement of, 40
  in obsessional neurosis, 184–5
  infantile, as source of neurosis, 109
  masturbation as source of, 22, 24, 91–2
  relation between, and its objects, 20, 21, 95

Anxiety, neurotic (*cont.*)
sexual origin of, 20–2, 74, 88–92, 97, 103–4, 106–7
Anxiety attacks, 88–9
Anxiety dreams, 18–20, 90–1
Anxiety hysteria, 88–9
Apotropaics (*see also* Protective formulae), 148, 170–1, 193, 196, 211, 219, 221
Arabian Nights, The, 208
Art, symbolism in, 163 *n.* 2
Association of ideas, 78, 104
compulsive, 223
Athena, 176 *n.* 2
Auditory dreams, 16
Auto-erotism (*see also* Masturbation), 12, 72 *n.* 2, 83–4, 87, 101, 158 *n.* 1, 185

Baby equated with faeces, 53 *n.* 1, 57, 67, 73, 81, 98, 100, 102, 167
Balaam, 148, 196
Bath
as symbol, 51–2, 53 *n.* 2, 75–6, 87, 97–8
fear of, 51–2, 75–6, 87, 98
Bed, child's longing to be in parents', 14, 20–1, 22, 28–31, 34, 36, 50, 63, 69, 85, 90–1, 101–2
Bedwetting, 83, 213
Bell, J. Sanford (*see also* Bibliography), 108 *n.* 1
Bernays, Martha (see *Freud, Martha*)
Bernfeld, S. (*see also* Bibliography), 210 *n.* 2
Bernheim, H., 79
Bible, the, 148, 196
Biological function of consciousness, 110
Birth (*see also* Anal theory of birth)
infantile theories of, 8–9, 11, 53 *n.* 1, 54–5, 56–60, 65–7, 69, 72–3, 81, 97–103, 165, 167
trauma of, 7 *n.* 3, 89 *n.* 2
Bisexuality, 84, 180–1
Bismarck, O. von, 233 *n.* 2
Bleuler, E. (*see also* Bibliography), 181 *n.* 1
Box as symbol, 53–5, 56–7, 58–60, 62, 66, 72–3, 75, 95–6
Breast-feeding, 7 and *n.* 3
Brion, F., 197 *n.* 2
Brooding, obsessional, 185
Brutus (in *Julius Caesar*), 138–9
Buch der Lieder (by *H. Heine*), 221 *n.* 3
Budapest, 214, 236
Busch, W., 13 *n.* 1

Captain, the 'cruel' (see *Novak, Captain*)
Cart as symbol, 35–40, 42, 51, 52, 69–70, 74–5, 95–6, 97–8, 100
Case
of '*Dora*', 4, 7, 120 *n.* 1, 184 *n.* 2
of '*Little Hans*', 3–113, 158 *n.* 1
of '*Rat Man*', 117–239, 95 *n.* 1
of '*Wolf Man*', 7 *n.* 3
Castration
complex, 7, 28, 77, 81, 93, 100
complex, use of term, 7 *nn.* 2 & 3
threat, 7 and *n.* 3, 25, 27–8, 82, 92, 198–9
Censorship, 129 *n.* 1, 158 *n.* 1
Childhood
memories and phantasies of, 7 *n.* 3, 94 *n.* 1, 158 *n.* 1
neuroses of, 89, 107–8, 109
Children (*see also* Infantile sexual theories; Infantile sexuality)
education of, 78, 79, 107, 109, 110–11
psychoanalysis of, 5, 78, 80, 108–9, 113
punishment of, 109, 157–8
relation to other children, 158 *n.* 1
sexual curiosity of (*see* Infantile sexual curiosity)
suggestibility of, 78
unreliability of assertions of, 79
Circumcision, 28 *n.* 2
Cleanliness, obsessional, 151, 204, 208
Clocks and watches, dislike of, 176
'Complex stimulus word', 165
'Complexive sensitiveness', 160
Component drives, 83, 105–6, 107, 109, 125, 155, 158 *n.* 1, 182, 185–6
Compromise formations
in dreams, 170
in hysteria, 147
in obsessional thinking, 168 *n.* 3, 184–5
Compulsions (*see* Obsessional acts; Obsessional impulses)

Compulsive
associations, 223
laughter on sad occasions, 148, 213, 231
Condensation, 64, 93 *n*. 2
Conflict, 147–8, 179–81
'Confluence of drives', 82, 97, 106 *n*. 1
Consciousness
biological function of, 110
obsessional ideas and, 168–9, 170, 186–8, 196, 209
relation to the unconscious, 80, 92–3, 136–7, 138, 173
repression and, 92–3, 109–10, 139, 144–5, 147, 150, 180–1
Wundt's view of, 10 *n*. 1
use of term, 110 *n*. 2
Constipation (*see also* Faeces, retention of, in infancy), 43, 76, 86 *n*. 2
Constructions in psychoanalysis, 140–1, 156–7, 198
Contrectation (*Moll*), 85
Conversion, hysterical, 89, 120
Coprophagy, 215
Coprophilia, 187 *n*. 1
Cowardice in '*Rat Man*', 142, 157, 197
Cow's udder connects ideas of penis and breast, 6–7

Death
attitude to, in obsessional neurosis, 176–7, 178–9, 223, 225–6
drive, 107 *n*. 1
fear of, 226, 230
Death wish, 177–9, 196, 224, 230
against brother or sister, 52–3, 55–6, 87, 98, 141–2
against father ('*Little Hans*'), 40, 70, 85–6, 87, 96, 98, 99–100, 102
against father ('*Rat Man*'), 137–41, 142, 154, 178–9, 198–9, 210, 224
suicidal (*see* Obsessional impulses, suicidal)
Defaecation (*see also* Constipation; Faeces), 42–4, 49–52, 74–5, 76, 82–3, 96–8, 102, 103, 105, 232–3
Defensive mechanisms (*see also* Apotropaics; Protective formulae), 145, 146, 150
in hysteria (*see* Repression)
in obsessional neurosis, 126, 127, 129–33, 137–8, 148, 168–71, 178, 179 *n*. 1, 183–4, 196, 221, 229–30
phobias as, 89–90
Defensive phantasy, 92
Deferred industriousness/obedience (see also *Nachträglichkeit*), 28, 225
Degeneracy, 78, 108–9
Deliria in obsessional neurosis, 126, 133, 161–4, 167, 169, 171, 187, 207, 223, 235–6
Delusions, 126, 177
Dementia praecox, 80
Derision expressed by absurdity, 166
Diableries érotiques (by *E. Le Poitevin*), 163 *n*. 2
Dichtung und Wahrheit (by *Goethe*), 156, 197, 201, 209
Dirt, '*Rat Man's*' feelings about, 163, 164, 204, 208, 213, 215, 222, 239
Disgust, 43–4, 48–9, 52, 83, 96, 105, 212, 222–3, 232
at prostitutes, 122, 163, 192, 197–8
Displacement
in obsessional ideas, 130, 173, 182–3, 184–5, 208
of affects, 150–1
on to something very small, 183, 185
Distortion
in dreams, 16, 169–71
in obsessional ideas, 169–73, 186–7, 209
in phobias, 93, 95–6, 104, 106
verbal, 187
Dogberry (in *Much Ado about Nothing*), 110
Door/gateway as symbol, 74, 97
'*Dora*', case of (*see* Case of '*Dora*')
Doubt
and dreams, 184 *n*. 2
in hysteria, 184 *n*. 2
meaning of neurotic, 184
obsessional, 146–7, 168, 172–3, 176, 182–4
Dream content, manifest, 170–1
Dream, *Freud's*, 'Non vixit', 139 *n*. 1

Dream, '*Little Hans's*'
of being at Gmunden, 10
of forfeits, 16–17, 47, 82
of losing his mother, 18–20, 90–1
Dream, '*Rat Man's*'
of Bavarian lieutenant, 210
of being engaged to his lady, 205
of captain's badge of rank, 221–2
of complex machine, 206
of copulating with his sister, 209
of dead person (absurd), 239 *n.* 1
of examination, 202, 207–8
of *Freud's* daughter with dung for eyes, 153, 220
of *Freud's* mother being dead, 148
of his father's return, 224
of idiot child's funeral, 203
of Japanese swords, 193, 201, 204–5, 212
of licking his lady's feet, 208
of not washing, 204–5
of pearl in road, 206
of rags changing to gorgeous clothes, 201–2
of *Reserl's* embrace, 201
of seeing his lady's grandmother naked, 212
of sister's illness, 205
of sister's teeth, 202–3
of springboard, 232
of terms of abuse, 208
of tobacco, 202
of tooth extraction, 237–9
of WŁK, 221
of walled town, 214–15
Dream, *Schönthan's*, of fishes' hair, 233
Dreams, 21–2, 113, 143, 170–1, 204
absurdity in, 166 *n.* 1
anxiety, 18–20, 90–1
auditory, 16
interpretation of, 158 *n.* 1, 165, 167
of the death of loved persons, 9 *n.* 2
premonitory, 196, 201–3, 207
punishment, 90
speeches in, 17, 170, 206
wish fulfilment in, 212
Drives, 84, 106–7, 109, 111, 176
confluence of, 82, 97, 106 *n.* 1

Dumas, A., 149, 200

Education, 78, 79, 107, 109, 110–11
Ego, the
relation of, to neurosis, 80, 125
standard for measuring the external world, 82
Egyptians, ancient, 176 *n.* 2, 223

Ellipsis
distortion by, 171–3, 210
in making jokes, 172 *n.* 2
Endopsychic perceptions, 126, 176
Enuresis, 83, 213
Epistemophilic drive (*see also* Infantile sexual curiosity), 185–6
Erect posture in man, 187
Erections, 124–5, 227, 232
Erotic feelings aroused in child
by mother's tenderness, 18, 22
by toilet, 15 and *n.* 1, 82–3
in bed with parents, 14, 22, 30–1, 91
Erotogenic zones, 82–4
Eructation, 193, 219, 223
Excretory pleasure, 75, 82–3
Exelberg, 228
Exhibitionism
in '*Little Hans*', 12, 16, 64, 82
in '*Rat Man*', 193, 207, 232
External world (*see* Reality)

Fackel, Die, 210 *n.* 1
Faeces (*see also* Constipation; Coprophagy; Coprophilia; Defaecation)
castration complex and loss of, 7 *n.* 3
equated with baby, 53 *n.* 1, 57, 67, 73, 81, 98, 100, 102, 167
equated with horse, 50–2
equated with load on cart, 97
equated with money, 153
playing with, 83
retention of, in infancy, 83, 216
Fairy tales, 8
Falling down as symbol, 36, 38–40, 41, 42, 45, 51, 61, 63, 68, 70, 73, 95–6, 98, 100, 104

False connection, 135 and *n*. 2
Father (see also '*Little Hans's*' father)
  as sexual opponent, 158 *n*. 1
  death wish against (*see* Death wish)
  role of the, doubts as to, 102–3, 110
Faust (by *Goethe*), 164 *n*. 4, 165 *n*. 1
Fear (*see also* Anxiety, neurotic; Phobias)
  corresponds to repressed wish, 138
  obsessional (*see* Obsessional fears)
  of baths, 51–2, 75–6, 87, 98
  of death, 226, 230
  of horse (*see* Horse)
  of punishment, 109, 157, 159–60, 199
  of railways, 64
  of streets, 18–21, 24–5, 33–4, 64, 73–4, 88
  of stuffed bird, 232
  of syphilis, 163, 216–17
Federn, *P.* (*see also* Bibliography), 117
Fellatio, 7, 213
Fetishism, 187 *n*. 2
First communications by patient, importance of, 123 *n*. 2, 153
Fixation, 16, 84
Flegeljahre (by *Jean Paul*), 203
Fliess, *W.*, *Freud's* letters to, 86 *n*. 5, 158 *n*. 1, 170 *n*. 2, 181 *n*. 2, 188 *n*. 1, 241
Fluss, *Gisela*, 210
Frankfurt, 150 *n*. 1
Freud, *Martha* (*Freud's* wife), 213, 220, 231

Genital zone, 82, 83–5
Genitals, distinction between male and female, 6, 8–10, 11, 17, 22, 25, 28, 48, 81–2, 84–5, 92, 102–3
Geschwister (by *H. Sudermann*), 141 *n*. 1
Giraffe as symbol, 29–31, 93–4
Gleichenberg, 219
God, 33, 65, 67, 70–1, 132, 148
Goethe, 98 *n*. 1, 156, 164 *n*. 4, 165 *n*. 1, 197, 201, 209
Greek myths, 7
Grubrich-Simitis, *I.* (*see also* Bibliography), 5 *n*. 1, 191, 239 *n*. 1
Grünhut, *S.*, 207–8
Guilt, sense of (*see also* Obsessional self-reproach), 7, 135, 141 *n*. 2, 225–6

Hamlet (by *Shakespeare*), 183 *n*. 2
Hamlet (in *Shakespeare's Hamlet*), 183 *n*. 2
Hanna ('*Little Hans's*' sister)
  birth of, 8–9, 11, 55, 56–8, 66–7, 69–70, 87, 98, 101–2
  '*Little Hans's*' affection for, 9, 53, 55–6, 87, 113
  '*Little Hans's*' death wish against, 52–3, 55–6, 87, 98
  '*Little Hans's*' interest in genitals of, 9–10, 11, 22, 25, 48, 81–2
  '*Little Hans's*' jealousy of, 9, 52–3, 55–6, 87, 101
  '*Little Hans's*' phantasy about, 53–5, 58–60, 98–9
Harden, *M.*, 233
Hauptzollamt station, 26, 63, 74, 76
Hawelka, *E.*, 191
Heine, *H.*, 221 *n*. 3
Heine, *T. T.*, 100 *n*. 1
Heredity and experience as aetiological factors, 78, 89, 108, 109–10, 111, 142
Hieroglyphics, 176 *n*. 2
Hietzing, 26
Homosexuality
  and early predominance of genital zone, 84
  and object choice, 84–5, 123 *n*. 2
  in '*Little Hans*', 12–14, 16, 84–5
  in '*Rat Man*', 123, 205, 232, 235
Horse
  identified with faeces, 51–2
  identified with '*Little Hans*', 40, 45, 106
  identified with '*Little Hans's*' father, 32–3, 35, 38–42, 64, 94, 96, 98, 104
  '*Little Hans's*' fear of, 19–25, 26, 31, 32–41, 53, 63, 70, 73–4, 76, 86, 88, 91–2, 93–7, 104–10
  '*Little Hans's*' interest in genitals of, 8, 10 *n*. 1, 11, 18, 21, 26–7, 46, 82
  '*Little Hans's*' phantasy of *Hanna* riding, 54, 58–60
  '*Little Hans's*' sadistic impulses towards, 61–2, 64, 86, 99
Huttens letzte Tage (by *C. F. Meyer*), 86 *n*. 5

Hydrotherapy, 122, 177, 192
Hypnosis, 173
Hypothetical obsessions, 228
Hysteria (*see also* Anxiety hysteria), 83, 88–9, 127, 145 *n.* 2, 147, 173, 182, 187
  compared to obsessional neurosis, 120, 127, 145 *n.* 2, 150, 188
  as negative of perversion, 83
Hysterical conversion, 88–9, 120

Ibsen, *H.*, 164
Ideational content and affect, 135, 150
Illness (*see also* Neuroses)
  flight into, 151–2, 219–20
  motive for, 152
  precipitating cause of, 40, 91, 96, 97, 104, 105, 149–53, 179–80, 222
  secondary gain from, 88, 151
Impotence, 238
Impulsion, 168, 183, 184–5
Incest, barrier against (*see also* Oedipus complex), 32
Incestuous desires
  of '*Little Hans*' for his mother, 71, 74, 85, 87–8, 90–1, 94, 99–103, 105
  of '*Rat Man*', 158 *n.* 1, 209–10
Indecision in obsessional neurosis, 125–6, 168, 179, 183–4, 204
Indeterminateness of obsessional ideas, 125–6, 130–1
Infantile masturbation, 15 *n.* 1, 22, 23 *n.* 3, 154–5, 185

The Complete Psychological Works of

SIGMUND FREUD

Original translation by
James Strachey

Revised, supplemented and edited by
Mark Solms

VOLUME XI

Five Lectures on Psychoanalysis, Leonardo da Vinci *and Other Works*

1910–1912

THE REVISED STANDARD EDITION OF
THE COMPLETE PSYCHOLOGICAL WORKS
OF SIGMUND FREUD

VOLUME XI

Leonardo's 'Mona Lisa'

Leonardo's 'Mona Lisa'

Freud writes (on p. 101 of this volume): 'It may very well have been that Leonardo was fascinated by Mona Lisa's smile for the reason that it awoke something in him which had for long lain dormant in his mind . . .'

NOTE ON THE REVISED TRANSLATION

The translations in this *Revised Standard Edition* are supplemented by four sets of notes:

(1) Lengthy commentaries on the English renditions of technical terms that are considered controversial are provided in Volume 24. Usually at the first appearance of each such technical term in each text, but sometimes in other places where the issue seems relevant, the original German word is interpolated in square brackets and a superscript upper-case [T] indicates that the term is discussed in the 24th volume. There (on pp. 55–99) the commentaries appear, in alphabetical order, under the heading 'Notes on the Translation of Some Technical Terms'. If the technical term appears in a derivate form in the text, the root word (as it appears in Volume 24) is provided in the margin. For example, if the interpolated word is the derivative [*überträgt*], the root technical term *Übertragung* appears in the margin.

(2) Shorter commentaries on the English rendition of specific words or phrases appearing in particular places (as opposed to general technical terms) that have attracted comment in the secondary literature are also provided in Volume 24. These minor commentaries are distinguished from those concerning general technical terms by the use of a superscript lower-case [t] in the place where the controversial translation appears. The corresponding set of annotations appears on pp. 105–33 of Volume 24, in chronological order, under the heading 'Annotations to Individual Translations'.

(3) Further interpolations in the translations of German words in square brackets are provided *ad hoc*, without superscript letters, for reasons that should be self-explanatory in each instance. For example, if a technical term which was referenced and discussed in a Note in Volume 24 appears again shortly afterwards in a way that illuminates the points discussed there, then it is silently referenced again. Some of these interpolations might seem odd to German-speaking readers, since no attempt is made to 'adjust' Freud's grammar to conform with the English translation (see the Preface to the Revised Edition, *RSE*, **1**, xxvi *n*. 1). The words in square brackets interpolated in the text are always exactly what Freud wrote.

(4) In a good few places, commentaries (of both types 1 and 2) are also provided in the Editors' introductory notes, appendices and footnotes to the text itself. These are indexed in Volume 24, on pp. 601–6, under the heading 'Notes on Terms and Their Uses'. Such commentaries are usually reserved for matters of translation that are likely to be of interest or value to the general reader, as opposed to those with a special interest in such technical matters.

The pagination of the original *Standard Edition* is provided also in the margins, in square brackets, to assist cross-referencing.

For the reasons explained in the 'Preface to the Revised Edition' (*RSE*, **1**, xxix), all differences between the *SE* and *RSE* are identified through light underscoring of the text. This device was considered necessary to make readers aware of the subtle and pervasive revisions of the translations. The same applies to the revisions of the editorial apparatus. This underscoring will hopefully be removed in later editions of the *RSE*, once the revised edition has become established as the canonical one.

The overarching policy here has been to underscore all differences between the *SE* and *RSE*, with minimal exceptions, in order to ensure transparency. The three categories of exceptions (i.e. the differences that are *not* underscored) are (a) changes that are purely typographical and/or absolutely stereotyped across Volumes 1–23, (b) changes in the location of Freud texts within or between volumes, and (c) all the changes to Volume 24.

The rationale behind (a) is that we wanted to avoid any subjective judgements by the Editor of the *RSE* as to what is and what is not 'significant'. For example, some but not all readers might consider alterations to Strachey's spelling, grammar and punctuation to be trivial, but the potential significance – however subtle – varies with context. The rationale behind (b) is that these changes are indicated in the 'List of Relocated Freud Material in the Revised Edition', which is provided in Volume 24. These changes are also mentioned in the revised (and therefore underscored) editorial notes to the texts themselves. The rationale behind (c) is that the *RSE* version of Volume 24 is so utterly different from the *SE* version that readers can safely consider the volume as a whole to be new.

The following changes were deemed purely typographical and absolutely stereotyped, and are therefore exempted from underscoring:

(1) Changes in type-size, font and spacing (since they are objectively insignificant).

(2) The marginalia – including page numbers – and the superscript ^{T}s and ^{t}s (since they always represent changes).

(3) Changed page numbers in the cross-references and indexes (this follows logically from point 2).

(4) Altered footnote numbers (since new footnotes are always identified by the fact that the notes themselves are underscored, and the knock-on effects for numbering are objectively insignificant).

(5) Changes in running headings (since they repetitively echo changes that are underscored in the main body of text).

(6) Change from the singular possessive 'Editor's' to the plural 'Editors'' (since this applies throughout and follows logically from the fact that, unlike the *SE*, the *RSE* has two editors). In the few instances where the Editor is referred to in the singular, it is always clear from the context whether this means Strachey or Solms or, in the case of Freud (1985*a* [1915]), Grubrich-Simitis.

(7) This preliminary 'Note on the Revised Translation' (since it is obviously added; it applies only to the *RSE*).

(8) Captions to the illustrations (since they always represent changes).

(9) Changes in editorial style (since they are stereotyped and therefore need only be identified once, namely here):

- The word 'and' in two-author citations becomes '&', and a comma is inserted between author name/s and the publication date (e.g. Freud & Breuer, 1895*d*).
- Abbreviations of months (e.g. 'Oct.') and chapters ('Chap.') are spelt out ('October', 'Chapter').
- '*The*' is added to all editorial references to '*Interpretation of Dreams*'.
- Title abbreviations conform to modern usage (e.g. *G.W.* becomes *GW*).
- Punctuation is positioned inside closing quotation marks (e.g. 'The Latin word slipped your memory.').

(10) Modernized hyphenation of words is underscored, but not for those terms that occur very repetitively in the text (since they are stereotyped and the list is limited enough for readers to memorize). Here is the list, which implies also the plural and other grammatical forms of these terms:

anxiety-dream	*becomes*	anxiety dream
anxiety-hysteria	*becomes*	anxiety hysteria
day-dream	*becomes*	daydream
death-wish	*becomes*	death wish
dream-content	*becomes*	dream content
dream-interpretation	*becomes*	dream interpretation
dream-thought	*becomes*	dream thought
ego-cathexis	*becomes*	ego cathexis
ego-libido	*becomes*	ego libido
love-object	*becomes*	love object
object-cathexis	*becomes*	object cathexis
object-choice	*becomes*	object choice
object-libido	*becomes*	object libido
object-love	*becomes*	object love
object-presentation	*becomes*	object presentation
object-relation	*becomes*	object relation
psycho-analysis	*becomes*	psychoanalysis
sound-presentation	*becomes*	sound presentation
super-ego	*becomes*	superego
thing-presentation	*becomes*	thing presentation
to-day	*becomes*	today
wish-fulfilment	*becomes*	wish fulfilment
word-presentation	*becomes*	word presentation

FIVE LECTURES ON PSYCHOANALYSIS

(1910 [1909])

EDITORS' NOTE

ÜBER PSYCHOANALYSE

GERMAN EDITIONS

1910 Leipzig and Vienna: Deuticke. Pp. 62. (2nd ed. 1912, 3rd ed. 1916, 4th ed. 1919, 5th ed. 1920, 6th ed. 1922, 7th ed. 1924, 8th ed. 1930; all unchanged.) [3]

'The Origin and Development of Psychoanalysis'
1910 *Am. J. Psychol.*, **21** (2 and 3), 181–218. (Tr. H. W. Chase.)
1910 In *Lectures and Addresses Delivered before the Departments of Psychology and Pedagogy in Celebration of the Twentieth Anniversary of the Opening of Clark University*, Worcester, Mass., Part I, 1–38. (Reprint of above.)
1924 In *An Outline of Psychoanalysis*, ed. Van Teslaar, New York: Boni & Liveright, 21–70. (Reissue of above.)
'Five Lectures on Psycho-Analysis'
1957 *SE*, **11**, 9–55. (Tr. J. Strachey.)
'On Psychoanalysis'
1992 *Freud, Jung, and Hall The King-Maker*, St Louis, 395–438. (Tr. Saul Rosenzweig.)

The present translation is a revised and corrected reprint of the *SE* version.

In 1909, Clark University, Worcester, Massachusetts, celebrated the twentieth year of its foundation, and its President, Dr G. Stanley Hall, invited Freud and some of his principal followers (C. G. Jung, S. Ferenczi, Ernest Jones and A. A. Brill) to take part in the occasion and to be awarded honorary degrees.[1] It was in December, 1908, that Freud first received the invitation, but it was not until the following autumn that the event took place, and Freud's five lectures were delivered on Tuesday, September 7, 1909,[2] and the four following days. This, as Freud himself declared at the time, was the first official recognition of the young science, and he described in his

1 Only Freud and Jung were officially invited, and only they got honorary degrees. The other three were 'gate-crashers'. (From a letter of October 20, 1957, Ernest Jones to James Strachey.)

2 Not Monday, September 6, as *SE*, **11**, 3 has it.

[4] *Autobiographical Study* (1925*d*; Chapter V), *RSE*, **20**, 45, how, as he stepped on to the platform to deliver his lectures, 'it seemed like the realization of some incredible daydream'.[1]

The lectures (in German, of course) were, according to Freud's almost universal practice, delivered extempore and, as we learn from Jones, without notes and after very little preparation. It was only after his return to Vienna that he was induced unwillingly to write them out.[2] This work was not finished till the second week of December, but his verbal memory was so good that, as Jones assures us, the printed version 'did not depart much from the original delivery'. On the other hand, as the research of Saul Rosenzweig (1992) reveals, several *deliberate* changes were introduced between the oral presentations and the published versions. Principal among these was the fact that the topics of the fourth and fifth published lectures – dream interpretation and sexual development, respectively – were assigned to the third and fourth days of the oral presentations. This was evidently because William James could attend only the presentation of Friday, September 10, and Freud apparently preferred to expound his theory of dreams (and free association) rather than infantile sexuality to him. However, many aspects of the fourth published lecture were included in the fifth oral presentation. This was apparently due to the fact that Freud wanted to cite his case report of 'Little Hans' directly after Jung had presented (on the same morning) the case of a four-year-old girl, 'Little Anna', who displayed similar sexual curiosity. Other topics covered in the fifth oral presentation, including eugenics, were dropped in the published version.

The first publication of the lectures was in an English translation in the *American Journal of Psychology* early in 1910, but the original German appeared soon afterwards as a pamphlet in Vienna.[3] The work proved a popular one and it passed through several editions; in none of these, however, was any alteration of substance made, except for the footnote added in 1923 at the very beginning, and appearing in the *Gesammelte Schriften* and *Gesammelte Werke* only, in which Freud retracted his expressions of indebtedness to Breuer. Some discussion of Freud's varying attitude to Breuer can be found in the Editors' Introduction to *Studies on Hysteria*, *RSE*, **2**, xxiv ff.

All through his career Freud was constantly ready to give expositions of his discoveries. (A list of these can be found below, on p. 53.) He had already published some short accounts of psychoanalysis, but this set of lectures was the first on an extended scale. These expositions naturally varied in difficulty according to the audience for which they were designed, and this must be reckoned among the

1 Another account of the occasion can be found in the 'History of the Psychoanalytic Movement' (1914*d*), *RSE*, **14**. A fuller description, from which most of the details given here are derived, is contained in Ernest Jones's biography (1955, 59 ff.). See also Rosenzweig (1992).

2 A note by Freud in the Archives in Washington, discovered by Ilse Grubrich-Simitis (1993, 167; trans., 126), records that the task was 'polished off in great haste' as he was 'fed up with the eternal repetitions'. We also know from the same source (1993, 211) that Freud had initially intended to entitle the manuscript 'Über die Entstehung und Entwicklung der Psychoanalyse' ('The Origin and Development of Psychoanalysis'; trans., 165; slightly modified here), which is in fact the title that was given to the first English translation.

3 During Freud's lifetime the lectures were translated into many other languages: Polish (1911), Russian (1911), Hungarian (1912), Dutch (1912), Italian (1915), Danish (1920), French (1921), Spanish (1923), Portuguese (1931) and Japanese (1933). Freud composed a brief Preface to the Italian translation (1915*j*). This appears below.

simplest ones, especially when compared with the great series of *Introductory Lectures* delivered a few years later (1916–17*a*). Nevertheless, in spite of all the additions that were to be made to the structure of psychoanalysis during the following quarter of a century, these lectures still provide an admirable preliminary picture which calls [5]
for very little correction. And they give an excellent idea of the ease and clarity of style and the unconstrained sense of form which made Freud such a remarkable expository lecturer.[1]

1 An account of Ferenczi's share in these lectures appears in Freud's obituary of him (1933*c*), *RSE*, **22**, 241 ff.

FIVE LECTURES ON PSYCHOANALYSIS

Delivered on the Occasion of the Celebration of the Twentieth Anniversary of the Foundation of Clark University, Worcester, Massachusetts September, 1909

TO DR G. STANLEY HALL, PH.D., LL.D.
PRESIDENT OF CLARK UNIVERSITY
PROFESSOR OF PSYCHOLOGY AND PEDAGOGICS
THIS WORK IS GRATEFULLY
DEDICATED

PREFACE TO THE ITALIAN TRANSLATION[1]

I was very eager to grant permission for this translation, which realizes a wish that I have long cherished. For many years I have needed to gather strength for new work from the charms of Italy, in whose literature I shall henceforth, thanks to the efforts of the translator, no longer be a stranger. Professor Levi Bianchini's exceptional understanding guarantees a correct rendition – something which not every author can enjoy.

Psychoanalysis seems to me above all to deserve the attention of physicians and educated people in general, for the close relations it re-establishes between psychiatry and many other sciences. In an essay published in the periodical *Scientia* (1913*j* [*RSE*, **13**, 157 ff.]) I have attempted to sketch these relations in general outline.

FREUD

Vienna, 1915

1 [First published in German in Marco Levi Bianchini's Italian translation of the Five Lectures, *Sulla psicoanalisi. Cinque conferenze tenute nel settembre 1909 alla Clark University di Worcester Mass. In occasione del 20° anniversario di fondazione*, p. 6. The present translation, the first into English, is by Mark Solms.]

FIRST LECTURE

Ladies and Gentlemen, it is with novel and bewildering feelings that I [9]
find myself in the New World, lecturing before an audience of expectant enquirers. No doubt I owe this honour only to the fact that my name is linked with the topic of psychoanalysis; and it is of psychoanalysis, therefore, that I intend to speak to you. I shall attempt to give you, as succinctly as possible, a survey of the history and subsequent development of this new method of investigation and treatment.

If it is a merit to have brought psychoanalysis into being, that merit is not mine.[1] I had no share in its earliest beginnings. I was a student and working for my final examinations at the time when another Viennese physician, Dr Josef Breuer,[2] first (in 1880–2) made use of this procedure on a girl who was suffering from hysteria. Let us turn our attention straight away to the history of this case and its treatment, which you will find set out in detail in the *Studies on Hysteria* (1895*d*)[3] which were published later by Breuer and myself.

But I should like to make one preliminary remark. It is not without satisfaction that I have learnt that the majority of my audience are not members of the medical profession. You have no need to be afraid that any special medical knowledge will be required for following what I have to say. It is true that we shall go along with the doctors on the first [10]
stage of our journey, but we shall soon part company with them and, with Dr Breuer, shall pursue a quite individual path.

Dr Breuer's patient was a girl of twenty-one, of high intellectual gifts. Her illness lasted for over two years, and in the course of it she developed a series of physical and psychological disturbances which decidedly deserved to be taken seriously. She suffered from a rigid paralysis,

1 [*Footnote added* 1923:] See, however, in this connection my remarks in 'A History of the Psychoanalytic Movement' (1914*d*), where I assumed the entire responsibility for psychoanalysis.

2 Dr Josef Breuer, born in 1842, a Corresponding Member of the Kaiserliche Akademie der Wissenschaften [Imperial Academy of the Sciences], is well known for his work on respiration and on the physiology of the sense of equilibrium. [His obituary by Freud (1925*g*), *RSE*, **19**, 287, included a more detailed account of his career.]

3 Some of my contributions to this book have been translated into English by Dr A. A. Brill of New York: *Selected Papers on Hysteria* (New York, 1909). [This was the first Freud book to appear in English. The complete Breuer & Freud *Studies* were translated by Brill later (New York, 1936). A new translation appeared in 1955, forming the second volume of the Freud *Standard Edition*. The case history of this patient (Fräulein Anna O.) can be found on p. 19 ff. of the Revised Edition.]

accompanied by loss of sensation, of both extremities on the right side of her body; and the same trouble from time to time affected her on her left side. Her eye movements were disturbed and her power of vision was subject to numerous restrictions. She had difficulties over the posture of her head; she had a severe nervous cough. She had an aversion to taking nourishment, and on one occasion she was for several weeks unable to drink in spite of a tormenting thirst. Her powers of speech were reduced, even to the point of her being unable to speak or understand her native language. Finally, she was subject to conditions of '*absence*',[1] of confusion, of delirium, and of alteration of her whole personality, to which we shall have presently to turn our attention.

When you hear such an enumeration of symptoms, you will be inclined to think it safe to assume, even though you are not doctors, that what we have before us is a severe illness, probably affecting the brain, that it offers small prospect of recovery and will probably lead to the patient's early decease. You must be prepared to learn from the doctors, however, that, in a number of cases which display severe symptoms such as these, it is justifiable to take a different and a far more favourable view. If a picture of this kind is presented by a young patient of the female sex, whose vital internal organs (heart, kidneys, etc.) are shown on objective examination to be normal, but who has been subjected to violent *emotional* shocks – if, moreover, her various symptoms differ in certain matters of detail from what would have been expected – then doctors are not inclined to take the case too seriously. They decide that what they have before them is not an organic disease of the brain, but the enigmatic condition which, from the time of ancient Greek medicine, has been known as 'hysteria' and which has the power of producing illusory pic-
[11] tures of a whole number of serious diseases. They consider that there is then no risk to life but that a return to health – even a complete one – is probable. It is not always quite easy to distinguish a hysteria like this from a severe organic illness. There is no need for us to know, however, how a differential diagnosis of that kind is made; it will suffice to have an assurance that the case of Breuer's patient was precisely of a kind in which no competent physician could fail to make a diagnosis of hysteria. And here we may quote from the report of the patient's illness the further fact that it made its appearance at a time when she was nursing her father, of whom she was devotedly fond, through the grave illness which led to his death, and that, as a result of her own illness, she was obliged to give up nursing him.

1 [The French neurological term.]

So far it has been an advantage to us to accompany the doctors; but the moment of parting is at hand. For you must not suppose that a patient's prospects of medical assistance are improved in essentials by the fact that a diagnosis of hysteria has been substituted for one of severe organic disease of the brain. Medical skill is in most cases powerless against severe diseases of the brain; but neither can the doctor do anything against hysterical disorders. He must leave it to kindly Nature to decide when and how his optimistic prognosis shall be fulfilled.[1]

Thus the recognition of the illness as hysteria makes little difference to the patient; but to the doctor quite the reverse. It is noticeable that his attitude towards hysterical patients is quite other than towards sufferers from organic diseases. He does not have the same sympathy for the former as for the latter: for the hysteric's ailment is, in fact, far less serious and yet it seems to claim to be regarded as equally so. And there is a further factor at work. Through his studies, the doctor has learnt many things that remain a sealed book to the layman: he has been able to form ideas on the causes of illness and on the changes it brings about – e.g. in the brain of a person suffering from apoplexy or from a malignant growth – ideas which must to some degree meet the case, since they allow him to understand the details of the illness. But all his knowledge [12]
– his training in anatomy, in physiology and in pathology – leaves him in the lurch when he is confronted with the details of hysterical phenomena. He cannot understand hysteria, and in the face of it he is himself a layman. This is not a pleasant situation for anyone who as a rule sets so much store by his knowledge. So it comes about that hysterical patients forfeit his sympathy. He regards them as people who are transgressing the laws of his science – like heretics in the eyes of the orthodox. He attributes every kind of wickedness to them, accuses them of exaggeration, of deliberate deceit, of malingering. And he punishes them by withdrawing his interest from them.

Dr Breuer's attitude towards his patient deserved no such reproach. He gave her both sympathy and interest, even though, to begin with, he did not know how to help her. It seems likely that she herself made his task easier by the admirable qualities of intellect and character to which he has testified in her case history. Soon, moreover, his benevolent scrutiny showed him the means of bringing her a first instalment of help.

1 I am aware that this is no longer the case; but in my lecture I am putting myself and my hearers back into the period before 1880. If things are different now, that is to a great extent the result of the activities whose history I am now sketching.

It was observed that, while the patient was in her states of '*absence*' (altered personality accompanied by confusion), she was in the habit of muttering a few words to herself which seemed as though they arose from some train of thought that was occupying her mind. The doctor, after getting a report of these words, used to put her into a kind of hypnosis and then repeat them to her so as to induce her to use them as a starting point. The patient complied with the plan, and in this way reproduced in his presence the mental creations which had been occupying her mind during the '*absences*' and which had betrayed their existence by the fragmentary words which she had uttered. They were profoundly melancholy phantasies [*Phantasien*][T] – 'daydreams' we should call them – sometimes characterized by poetic beauty, and their starting point was as a rule the position of a girl at her father's sick-bed. When she had related a number of these phantasies, she was as if set free, and she was brought back to normal mental life. The improvement in her condition, which would last for several hours, would be succeeded next day by a further attack of '*absence*'; and this in turn would be removed in the
[13] same way by getting her to put into words her freshly constructed phantasies [*Phantasiebildungen*]. It was impossible to escape the conclusion that the alteration in her mental state which was expressed in the '*absences*' was a result of the stimulus proceeding from these highly emotional phantasies. The patient herself, who, strange to say, could at this time only speak and understand English, christened this novel kind of treatment the 'talking cure'[1] or used to refer to it jokingly as 'chimney-sweeping'[1].

It soon emerged, as though by chance, that this process of sweeping the mind [*Seele*][T] clean could accomplish more than the merely temporary relief of her ever-recurring mental confusion. It was actually possible to bring about the disappearance of the painful symptoms of her illness, if she could be brought to remember under hypnosis, with an accompanying expression of affect, on what occasion and in what connection the symptoms had first appeared. 'It was in the summer during a period of extreme heat, and the patient was suffering very badly from thirst; for, without being able to account for it in any way, she suddenly found it impossible to drink. She would take up the glass of water that she longed for, but as soon as it touched her lips she would push it away like someone suffering from hydrophobia. As she did this, she was obviously in an *absence* for a couple of seconds. She lived only on fruit, such as melons, etc., so as to lessen her tormenting thirst. This

1 [These phrases are in English in the original.]

had lasted for some six weeks, when one day during hypnosis she grumbled about her English "lady companion", whom she did not care for, and went on to describe, with every sign of disgust, how she had once gone into this lady's room and how her little dog – horrid creature! – had drunk out of a glass there. The patient had said nothing, as she had wanted to be polite. After giving further energetic expression to the anger she had held back, she asked for something to drink, drank a large quantity of water without any difficulty [*ohne Hemmung*][T], and awoke from her hypnosis with the glass at her lips; and thereupon the disturbance vanished, never to return.'[1]

With your permission, I should like to pause a moment over this event. Never before had anyone removed a hysterical symptom by such a method or had thus gained so deep an insight into its causation. It could not fail to prove a momentous discovery if the expectation were [14] confirmed that others of the patient's symptoms – perhaps the majority of them – had arisen and could be removed in this same manner. Breuer spared no pains in convincing himself that this was so, and he proceeded to a systematic investigation of the pathogenesis of the other and more serious symptoms of the patient's illness. And it really *was* so. Almost all the symptoms had arisen in this way as residues – 'precipitates' they might be called – of emotional experiences. To these experiences, therefore, we later gave the name of 'psychical traumas', while the particular nature of the symptoms was explained by their relation to the traumatic scenes which were their cause. They were, to use a technical term, 'determined' by the scenes of whose recollection they represented residues, and it was no longer necessary to describe them as capricious or enigmatic products of the neurosis. One unexpected point, however, must be noticed. What left the symptom behind was not always a *single* experience. On the contrary, the result was usually brought about by the convergence of several traumas, and often by the repetition of a great number of similar ones. Thus it was necessary to reproduce the whole chain of pathogenic memories in chronological order, or rather in reversed order, the latest ones first and the earliest ones last; and it was quite impossible to jump over the later traumas in order to get back more quickly to the first, which was often the most potent one.

No doubt you will now ask me for some further instances of the causation of hysterical symptoms besides the one I have already given you of a fear of water produced by disgust at a dog drinking out of a glass. But

1 *Studies on Hysteria* [*RSE*, **2**, 31–2].

if I am to keep to my programme I shall have to restrict myself to very few examples. In regard to the patient's disturbances of vision, for instance, Breuer describes how they were traced back to occasions such as one on which, 'when she was sitting by her father's bedside with tears in her eyes, he suddenly asked her what time it was. She could not see clearly; she made a great effort, and brought her watch near to her eyes. The face of the watch now seemed very big – thus accounting for her macropsia and convergent squint. Or again, she tried hard to suppress her tears so that
[15] the sick man should not see them.'[1] Moreover, all of the pathogenic impressions came from the period during which she was helping to nurse her sick father. 'She once woke up during the night in great anxiety about the patient, who was in a high fever; and she was under the strain of expecting the arrival of a surgeon from Vienna who was to operate. Her mother had gone away for a short time and Anna was sitting at the bedside with her right arm over the back of her chair. She fell into a waking dream and saw a black snake coming towards the sick man from the wall to bite him. (It is most likely that there were, in fact, snakes in the field behind the house and that these had previously given the girl a fright; they would thus have provided the material for her hallucination.) She tried to keep the snake off, but it was as though she was paralysed. Her right arm, over the back of the chair, had gone to sleep and had become anaesthetic and paretic; and when she looked at it the fingers turned into little snakes with death's heads (the nails). (It seems probable that she had tried to use her paralysed right arm to drive off the snake and that its anaesthesia and paralysis had consequently become associated with the hallucination of the snake.) When the snake vanished, in her terror [*Angst*][T] she tried to
Versagung pray. But language failed [*versagte*][T] her: she could find no tongue in which to speak, till at last she thought of some children's verses in English and then found herself able to think and pray in that language.'[2] When the patient had recollected this scene in hypnosis, the rigid paralysis of her left arm, which had persisted since the beginning of her illness, disappeared, and the treatment was brought to an end.

When, some years later, I began to employ Breuer's method of examination and treatment on patients of my own, my experiences agreed entirely with his. A lady, aged about forty, suffered from a tic consisting of a peculiar 'clacking' sound which she produced whenever she was excited, or sometimes for no visible reason. It had its origin in two experiences, whose common element lay in the fact that at the moment

1 *Studies on Hysteria* [*RSE*, **2**, 36].

2 *Studies on Hysteria* [ibid., **2**, 35–6].

of their occurrence she had formed a determination not to make any noise, and in the fact that on both these occasions a kind of counterwill led her to break the silence with this same sound. On the first of these occasions one of her children had been ill, and, when she had at last with great difficulty succeeded in getting it off to sleep, she had said to herself [16] that she must keep absolutely still so as not to wake it. On the other occasion, while she was driving with her two children in a thunderstorm, the horses had bolted and she had carefully tried to avoid making any noise for fear of frightening them even more.[1] I give you this one example out of a number of others which are reported in the *Studies on Hysteria*.[2]

Ladies and gentlemen, if I may be allowed to generalize – which is unavoidable in so condensed an account as this – I should like to formulate what we have learnt so far as follows: *our hysterical patients suffer from reminiscences*. Their symptoms are residues and mnemic symbols of particular (traumatic) experiences. We may perhaps obtain a deeper understanding of this kind of symbolism if we compare them with other mnemic symbols in other fields. The monuments and memorials with which large cities are adorned are also mnemic symbols. If you take a walk through the streets of London, you will find, in front of one of the great railway termini, a richly carved Gothic column – Charing Cross. One of the old Plantagenet kings of the thirteenth century ordered the body of his beloved Queen Eleanor to be carried to Westminster; and at every stage at which the coffin rested he erected a Gothic cross. Charing Cross is the last of the monuments that commemorate the funeral cortège.[3] At another point in the same town, not far from London Bridge, you will find a towering, and more modern, column, which is simply known as 'The Monument'. It was designed as a memorial of the Great Fire, which broke out in that neighbourhood in 1666 and destroyed a large part of the city. These monuments, then, resemble hysterical symptoms in being mnemic symbols; up to that point the comparison seems justifiable. But what should we think of a Londoner who paused today [17] in deep melancholy before the memorial of Queen Eleanor's funeral instead of going about his business in the hurry that modern working

1 *Studies on Hysteria* [*RSE*, **2**, 49 and 52–3].

2 Extracts from that volume, together with some later writings of mine on hysteria, are now to be had in an English translation prepared by Dr A. A. Brill of New York. [See footnote 3, p. 11 above. The case here reported is that of Frau Emmy von N., the second in *Studies on Hysteria*, *RSE*, **2**, 44 ff.]

3 Or rather, it is a modern copy of one of these monuments. As Dr Ernest Jones tells me, the name 'Charing' is believed to be derived from the words '*chère reine*'.

conditions demand or instead of feeling joy over the youthful queen of his own heart? Or again what should we think of a Londoner who shed tears before the Monument that commemorates the reduction of his beloved metropolis to ashes although it has long since risen again in far greater brilliance? Yet every single hysteric and neurotic behaves like these two unpractical Londoners. Not only do they remember painful experiences of the remote past, but they still cling to them emotionally; they cannot get free of the past and for its sake they neglect what is real and immediate. This fixation of mental life [*Seelenlebens*] to pathogenic traumas is one of the most significant and practically important characteristics of neurosis.

I am quite ready to allow the justice of an objection that you are probably raising at this moment on the basis of the case history of Breuer's patient. It is quite true that all her traumas dated from the period when she was nursing her sick father and that her symptoms can only be regarded as mnemic signs of his illness and death. Thus, they correspond to a display of mourning, and there is certainly nothing pathological in being fixated to the memory of a dead person so short a time after his decease; on the contrary, it would be a normal emotional process. I grant you that in the case of Breuer's patient there is nothing striking in her fixation to her trauma. But in other cases – such as that of the tic that I treated myself, where the determinants dated back more than fifteen and ten years – the feature of an abnormal attachment to the past is very clear; and it seems likely that Breuer's patient would have developed a similar feature if she had not received cathartic treatment so soon after experiencing the traumas and developing the symptoms.

So far we have only been discussing the relations between a patient's hysterical symptoms and the events of her life. There are, however, two further factors in Breuer's observation which enable us to form some notion of how the processes of falling ill and of recovering occur.

In the first place, it must be emphasized that Breuer's patient, in almost all her pathogenic situations, was obliged to *suppress* a powerful emo-
[18] tion [*Erregung*]^{T} instead of allowing its discharge [*Ablauf*]^{T} in the appropriate signs of emotion, words or actions. In the episode of her lady companion's dog, she suppressed any manifestation of her very intense disgust, out of consideration for the woman's feelings; while she watched at her father's bedside she was constantly on the alert to prevent the sick man from observing her anxiety and her painful depression. When subsequently she reproduced these scenes in her doctor's presence

the affect which had been inhibited [*gehemmte*] at the time emerged with peculiar violence, as though it had been saved up for a long time. Indeed, the symptom which was left over from one of these scenes would reach its highest pitch of intensity at the time when its determining cause was being approached, only to vanish when that cause had been fully ventilated. On the other hand, it was found that no result was produced by the recollection of a scene in the doctor's presence if for some reason the recollection took place without any generation of affect. Thus it was what happened to these affects, which might be regarded as displaceable magnitudes, that was the decisive factor both for the onset of illness and for recovery. One was driven to assume that the illness occurred because the affects generated in the pathogenic situations had their normal outlet blocked, and that the essence of the illness lay in the fact that these 'strangulated' affects were then put to an abnormal use. In part they remained as a permanent burden upon the patient's mental life and a source of constant excitation for it; and in part they underwent a transformation into unusual somatic innervations and inhibitions, which manifested themselves as the physical symptoms of the case. For this latter process we coined the term 'hysterical conversion'. Quite apart from this, a certain portion of our mental excitation [*Erregung*] is normally directed along the paths of somatic innervation and produces what we know as an 'expression of the emotions'. Hysterical conversion exaggerates this portion of the discharge of an emotionally cathected [*besetzten*][T] mental process; it represents a far more intense expression of the emotions, which has entered upon a new path. When the bed of a stream is divided into two channels, then, if the current in one of them is brought up against an obstacle, the other will at once be overfilled. As you see, we are on the point of arriving at a purely psychological theory of hysteria, with affective processes in the front rank.

Besetzung

A second observation of Breuer's, again, compels us to attach great [19] importance, among the characteristics of the pathological chain of events, to states of consciousness. Breuer's patient exhibited, alongside of her normal state, a number of mental peculiarities: conditions of '*absence*', confusion, and alterations of character. In her normal state she knew nothing of the pathogenic scenes or their connection with her symptoms; she had forgotten the scenes, or at all events had severed the pathogenic link. When she was put under hypnosis, it was possible, at the expense of a considerable amount of labour, to recall the scenes to her memory; and, through this work of recollecting, the symptoms were removed. The explanation of this fact would be a most awkward

business, were it not that the way is pointed by experiences and experiments in hypnotism. The study of hypnotic phenomena has accustomed us to what was at first a bewildering realization [*Auffassung*][T] that in one and the same individual there can be several mental groupings, which can remain more or less independent of one another, which can 'know nothing' of one another and which can alternate with one another in their hold upon consciousness. Cases of this kind, too, occasionally appear spontaneously, and are then described as examples of '*double conscience*'.[1] If, where a splitting of the personality such as this has occurred, consciousness remains attached regularly to one of the two states, we call it the *conscious* mental state and the other, which is detached from it, the *unconscious* one. In the familiar condition known as 'post-hypnotic suggestion', a command given under hypnosis is slavishly carried out subsequently in the normal state. This phenomenon affords an admirable example of the influences which the unconscious state can exercise over the conscious one; moreover, it provides a pattern upon which we can account for the phenomena of hysteria. Breuer adopted a hypothesis that hysterical symptoms arise in peculiar mental conditions to which he gave the name of 'hypnoid'. On this view, excitations occurring during these hypnoid states can easily become pathogenic because such states do not provide opportunities for the normal discharge of the process of excitation. There consequently arises from the process of excitation an unusual product – the symptom. This
[20] finds its way, like a foreign body, into the normal state, which in turn is in ignorance of the hypnoid pathogenic situation. Wherever there is a symptom there is also an amnesia, a gap in the memory, and filling in this gap implies the removal of the conditions which led to the production of the symptom.

This last part of my account will not, I fear, strike you as particularly clear. But you should bear in mind that we are dealing with novel and difficult considerations, and it may well be that it is not possible to make them much clearer – which shows that we still have a long way to go in our knowledge of the subject. Moreover, Breuer's theory of 'hypnoid states' turned out to be impeding and unnecessary, and it has been dropped by psychoanalysis today. Later on, you will at least have a hint of the influences and processes that were to be discovered behind the screen [*Schranke*] of hypnoid states erected by Breuer. You will have rightly formed the opinion, too, that Breuer's investigation has only succeeded in offering you a very incomplete theory and an unsatisfying

1 [The French term for 'dual consciousness'.]

explanation of the phenomena observed. But complete theories do not fall ready-made from the sky and you would have even better grounds for suspicion if anyone presented you with a flawless and complete theory at the very beginning of his observations. Such a theory could only be a child of his speculation and could not be the fruit of an unprejudiced examination of the facts.

SECOND LECTURE

[21] Ladies and Gentlemen, at about the same time at which Breuer was carrying on the 'talking cure' with his patient, the great Charcot in Paris had begun the researches into hysterical patients at the Salpêtrière which were to lead to a new understanding of the disease. There was no possibility of his findings being known in Vienna at that time. But when, some ten years later, Breuer and I published our 'Preliminary Communication' on the psychical mechanism of hysterical phenomena [1893*a*], which linked up with the cathartic treatment of Breuer's first patient,[1] we were completely under the spell of Charcot's researches. We regarded the pathogenic experiences of our patients as psychical traumas, and equated them with the somatic traumas whose influence on hysterical paralyses had been established by Charcot; and Breuer's hypothesis of hypnoid states was itself nothing but a reflection of the fact that Charcot had reproduced those traumatic paralyses artificially under hypnosis.

The great French observer, whose pupil I became in 1885–6, was not himself inclined to adopt a psychological outlook [*Auffassungen*]. It was his pupil, Pierre Janet, who first attempted a deeper approach to the peculiar psychical processes present in hysteria, and we followed his example when we took the splitting of the mind and dissociation of the personality as the centre of our position. You will find in Janet a theory of hysteria which takes into account the prevailing views in France on the part played by heredity and degeneracy. According to him, hysteria is a form of degenerate modification of the nervous system, which shows itself in an innate weakness in the power of psychical synthesis. Hysterical patients, he believes, are inherently incapable of holding together the multiplicity of mental processes into a unity, and hence arises the tendency to mental dissociation. If I may be allowed to draw a homely but clear analogy, Janet's hysterical patient reminds one of a feeble woman who has gone out shopping and is now returning home laden with a multitude of parcels and boxes. She cannot contain the whole heap of them with her two arms and ten fingers. So first of all one object
[22] slips from her grasp; and when she stoops to pick it up, another one escapes her in its place, and so on. This supposed mental weakness of hysterical patients is not confirmed when we find that, alongside these

1 [This clause was accidently omitted in the *SE* translation.]

phenomena of diminished capacity, examples are also to be observed of a partial increase in efficiency, as though by way of compensation. At the time when Breuer's patient had forgotten her mother tongue and every other language but English, her grasp of English reached such heights that, if she was handed a German book, she was able straight away to read out a correct and fluent translation of it.

When, later on, I set about continuing on my own account the investigations that had been begun by Breuer, I soon arrived at another view of the origin of hysterical dissociation (the splitting of consciousness). A divergence of this kind, which was to be decisive for everything that followed, was inevitable, since I did not start out, like Janet, from laboratory experiments, but with therapeutic aims in mind.

I was driven forward above all by practical necessity. The cathartic procedure, as carried out by Breuer, presupposed putting the patient into a state of deep hypnosis; for it was only in a state of hypnosis that he attained a knowledge of the pathogenic connections which escaped him in his normal state. But I soon came to dislike hypnosis, for it was a temperamental and, one might almost say, a mystical ally. When I found that, in spite of all my efforts, I could not succeed in bringing more than a fraction of my patients into a hypnotic state, I determined to give up hypnosis and to make the cathartic procedure independent of it. Since I was not able at will to alter the mental state of the majority of my patients, I set about working with them in their *normal* state. At first, I must confess, this seemed a senseless and hopeless undertaking. I was set the task of learning from the patient something that I did not know and that he did not know himself. How could one hope to elicit it? But there came to my help a recollection of a most remarkable and instructive experiment which I had witnessed when I was with Bernheim at Nancy [in 1889]. Bernheim showed us that people whom he had put into a state of hypnotic somnambulism, and who had had all kinds of experiences while they were in that state, only *appeared* to have lost the memory of what they had experienced during somnambulism; it was possible to revive these memories in their normal state. It is true that, when he questioned them about their somnambulistic experiences, they began by maintaining that they knew nothing about them; but if he refused to give way, and insisted, and assured them that they *did* know about them, the forgotten experiences always reappeared. [23]

So I did the same thing with my patients. When I reached a point with them at which they maintained that they knew nothing more, I assured

them that they *did* know it all the same, and that they had only to say it; and I ventured to declare that the right memory would occur to them at the moment at which I laid my hand on their forehead. In that way I succeeded, without using hypnosis, in obtaining from the patients whatever was required for establishing the connection between the pathogenic scenes they had forgotten and the symptoms left over from those scenes. But it was a laborious procedure, and in the long run an exhausting one; and it was unsuited to serve as a permanent technique.

I did not abandon it, however, before the observations I made during my use of it afforded me decisive evidence. I found confirmation of the fact that the forgotten memories were not lost. They were in the patient's possession and were ready to emerge in association [*Assoziation*] to what was still known by him; but there was some force that prevented them from becoming conscious and compelled them to remain unconscious. The existence of this force [*Kraft*][T] could be assumed with certainty, since one became aware of an effort corresponding to it if, in opposition to it, one tried to introduce the unconscious memories into the patient's consciousness. The force which was maintaining the pathological condition became apparent in the form of *resistance* on the part of the patient.

It was on this idea of resistance, then, that I based my view of the course of psychical events in hysteria. In order to effect a recovery, it had proved necessary to remove these resistances. Starting out from the mechanism of cure, it now became possible to construct quite definite ideas [*Vorstellungen*][T] of the origin of the illness. The same forces which, in the form of resistance, were now offering opposition to the forgotten material's being made conscious must formerly have brought about the
[24] forgetting and must have pushed the pathogenic experiences in question out of consciousness. I gave the name of '*repression*' [*Verdrängung*][T] to this hypothetical process, and I considered that it was proved by the undeniable existence of resistance.

The further question could then be raised as to what these forces were and what the determinants were of the repression in which we now recognized the pathogenic mechanism of hysteria. A comparative study of the pathogenic situations which we had come to know through the cathartic procedure made it possible to answer this question. All these experiences had involved the emergence of a wishful impulse [*Wunschregung*] which was in sharp contrast to the subject's other wishes and which proved incompatible with the ethical and aesthetic standards of

his personality. There had been a short conflict, and the end of this internal struggle was that the idea which had appeared before consciousness as the vehicle of this irreconcilable wish fell victim to repression, was pushed out of consciousness with all its attached memories, and was forgotten. Thus the incompatibility of the wish in question with the patient's ego [*Ich*][T] was the motive [*Motiv*][T] for the repression; the subject's ethical and other standards were the repressing forces. An acceptance of the incompatible wishful impulse or a prolongation of the conflict would have produced a high degree of unpleasure [*Unlust*][T]; this unpleasure was avoided by means of repression, which was thus revealed as one of the devices serving to protect the mental personality.

To take the place of a number of instances, I will relate a single one of my cases, in which the determinants and advantages of repression are sufficiently evident. For my present purpose I shall have once again to abridge the case history and omit some important underlying material. The patient was a girl,[1] who had lost her beloved father after she had taken a share in nursing him – a situation analogous to that of Breuer's patient. Soon afterwards her elder sister married, and her new brother-in-law aroused in her a peculiar feeling of sympathy which was easily masked under a disguise of family affection. Not long afterwards her sister fell ill and died, in the absence of the patient and her mother. They were summoned in all haste without being given any definite information of the tragic event. When the girl reached the bedside of her dead sister, there came to her for a brief moment an idea that might be expressed in these words: 'Now he is free and can marry me.' We may assume with certainty that this idea, which betrayed to her consciousness the intense love for her brother-in-law of which she had not herself been conscious, was surrendered to repression a moment later, owing to the revolt of her feelings. The girl fell ill with severe hysterical symptoms; and while she was under my treatment it turned out that she had completely forgotten the scene by her sister's bedside and the odious egoistic impulse that had emerged in her. She remembered it during the treatment and reproduced the pathogenic moment with signs of the most violent emotion, and, as a result of the treatment, she became healthy once more. [25]

Perhaps I may give you a more vivid picture of repression and of its necessary relation to resistance, by a rough analogy derived from our actual situation at the present moment. Let us suppose that in this

1 [This is the case of Fräulein Elisabeth von R., the fifth of the case histories fully reported in *Studies on Hysteria*, *RSE*, **2**, 120 ff.]

lecture room and among this audience, whose exemplary quiet and attentiveness I cannot sufficiently commend, there is nevertheless someone who is causing a disturbance and whose ill-mannered laughter, chattering and shuffling with his feet are distracting my attention from my task. I have to announce that I cannot proceed with my lecture; and thereupon three or four of you who are strong men stand up and, after a short struggle, put the interrupter outside the door. So now he is 'repressed', and I can continue my lecture. But in order that the interruption shall not be repeated, in case the individual who has been expelled should try to enter the room once more, the gentlemen who have put my will into effect place their chairs up against the door and thus establish a 'resistance' after the repression has been accomplished. If you will now translate [*übertragen*] the two localities concerned into psychical terms as the 'conscious' and the 'unconscious', you will have before you a fairly good picture of the process of repression.

You will now see in what it is that the difference lies between our view [*Auffassung*] and Janet's. We do not derive the psychical splitting from an
[26] innate incapacity for synthesis on the part of the mental apparatus; we explain it dynamically, from the conflict of opposing mental forces and recognize it as the outcome of an active struggling on the part of the two psychical groupings against each other. But our view gives rise to a large number of fresh problems. Situations of mental conflict are, of course, exceedingly common; efforts by the ego to ward off [*erwehren*] painful memories are quite regularly to be observed without their producing the result of a mental split. The reflection cannot be escaped that further determinants must be present if the conflict is to lead to dissociation. I will also readily grant you that the hypothesis of repression leaves us not at the end but at the beginning of a psychological theory. We can only go forward step by step however, and complete knowledge must await the results of further and deeper researches.

Nor is it advisable to attempt to explain the case of Breuer's patient from the point of view of repression. That case history is not suited to this purpose, because its findings were reached with the help of hypnotic influence. It is only if you exclude hypnosis that you can observe resistances and repressions and form an adequate idea of the truly pathogenic course of events. Hypnosis conceals the resistance and renders a certain area of the mind accessible; but, as against this, it builds up the resistance at the frontiers of this area into a wall that makes everything beyond it inaccessible.

Our most valuable lesson from Breuer's observation was what it proved concerning the relation between symptoms and pathogenic experiences or psychical traumas, and we must not omit now to consider these discoveries from the standpoint of the theory of repression. At first sight it really seems impossible to trace a path from repression to the formation of symptoms. Instead of giving a complicated theoretical account, I will return here to the analogy which I employed earlier for my explanation of repression. If you come to think of it, the removal of the interrupter and the posting of the guardians at the door may not mean the end of the story. It may very well be that the individual who has been expelled, and who has now become embittered and reckless, will cause us further trouble. It is true that he is no longer among us; we are free from his presence, from his insulting laughter and his *sotto voce* comments. But in some respects, nevertheless, the repression has been unsuccessful; [27] for now he is making an intolerable exhibition of himself outside the room, and his shouting and banging on the door with his fists interfere with [*hemmt*] my lecture even more than his bad behaviour did before. In these circumstances we could not fail to be delighted if our respected president, Dr Stanley Hall, should be willing to assume the role of mediator and peacemaker. He would have a talk with the unruly person outside and would then come to us with a request that he should be readmitted after all: he himself would guarantee that the man would now behave better. On Dr Hall's authority we decide to lift the repression, and peace and quiet are restored. This presents what is really no bad picture of the physician's task in the psychoanalytic treatment of the neuroses.

To put the matter more directly. The investigation of hysterical patients and of other neurotics leads us to the conclusion that their repression of the idea to which the intolerable wish is attached has been a *failure*. It is true that they have driven it out of consciousness and out of memory and have apparently saved themselves a large amount of unpleasure. *But the repressed wishful impulse continues to exist in the unconscious*. It is on the look-out for an opportunity of being activated, and when that happens it succeeds in sending into consciousness a disguised and unrecognizable *substitute* for what had been repressed, and to this there soon become attached the same feelings of unpleasure which it was hoped had been saved by the repression. This substitute for the repressed idea – the *symptom* – is proof against further attacks from the defensive [*abwehrenden*][T] ego; and in place of the short conflict an *Abwehr* ailment now appears which is not brought to an end by the passage of

time. Alongside the indication of distortion in the symptom, we can trace in it the remains of some kind of indirect resemblance to the idea [*Idee*] that was originally repressed. The paths along which the substitution was effected can be traced in the course of the patient's psychoanalytic treatment; and in order to bring about recovery, the symptom must be led back along the same paths and once more turned into the repressed idea. If what was repressed is brought back again into conscious mental activity – a process which presupposes the overcoming of considerable resistances – the resulting psychical conflict, which the patient had tried
[28] to avoid, can, under the physician's guidance, reach a better outcome than was offered by repression. There are a number of such opportune solutions, which may bring the conflict and the neurosis to a happy end, and which may in certain instances be combined. The patient's personality may be convinced that it has been wrong in rejecting the pathogenic wish and may be led into accepting it wholly or in part; or the wish itself may be directed to a higher and consequently unobjectionable aim (this is what we call its 'sublimation'); or the rejection of the wish may be recognized as a justifiable one, but the automatic and therefore inefficient mechanism of repression may be replaced by a condemning judgement with the help of the highest human mental functions – conscious control of the wish is attained.

You must forgive me if I have not succeeded in giving you a more clearly intelligible account of these basic positions adopted by the method of treatment that is now described as 'psychoanalysis'. The difficulties have not lain only in the novelty of the subject. The nature of the incompatible wishes which, in spite of repression, succeed in making their existence in the unconscious perceptible, and the subjective and constitutional determinants which must be present in anyone before a failure of repression can occur and a substitute or symptom be formed – on all this I shall have more light to throw in some of my later observations.

THIRD LECTURE

Ladies and Gentlemen, it is not always easy to tell the truth, especially [29]
when one has to be concise; and I am thus today obliged to correct a wrong statement that I made in my last lecture. I said to you that, having dispensed with hypnosis, I insisted on my patients nevertheless telling me what occurred to them in connection with the subject under discussion, and assured them [*einfiele*] that they really knew everything that they had ostensibly forgotten [*alles angeblich Vergessene*] and that the idea that occurred to them [*Einfall*][1] would infallibly contain what we were in search of; and I went on to say to you that I found that the first idea occurring to my patients did in fact produce the right thing and turned out to be the forgotten continuation of the memory. This, however, is not in general the case, and I put the matter so simply only for the sake of brevity. Actually it was only for the first few times that the right thing which had been forgotten turned up as a result of simple insistence on my part. When the procedure was carried further, ideas kept on emerging that could not be the right ones, since they were not appropriate and were rejected as being wrong by the patients themselves. Insistence was of no further help at this point, and I found myself once more regretting my abandonment of hypnosis.

While I was thus at a loss, I clung to a prejudice the scientific justification for which was proved years later by my friend C. G. Jung and his pupils in Zürich. I am bound to say that it is sometimes most useful to have prejudices. I cherished a high opinion of the strictness with which mental processes are determined, and I found it impossible to believe that an idea produced by a patient while his attention was on the stretch could be an arbitrary one and unrelated to the idea we were in search of. The fact that the two ideas were not identical could be satisfactorily explained from the postulated psychological state of affairs. In the [30]
patient under treatment two forces were in operation against each other: on the one hand, his conscious endeavour to bring into consciousness the forgotten idea in his unconscious, and on the other hand, the resistance we already know about, which was striving to prevent what was repressed or its derivatives from thus becoming conscious. If

1 [This German word is often translated 'association'; but the latter is a question-begging word and is avoided here as far as possible, even at the price of such long paraphrases as the present one. When, however, we come to '*freier Einfall*', 'free association' (though still objectionable) is hardly to be escaped. See *RSE*, **24**, 63–4.]

this resistance amounted to little or nothing, what had been forgotten became conscious without distortion. It was accordingly plausible to suppose that the greater the resistance against what we were in search of becoming conscious, the greater would be its distortion. The idea which occurred to the patient in place of what we were in search of had thus itself originated like a symptom: it was a new, artificial and ephemeral substitute for what had been repressed, and was dissimilar to it in proportion to the degree of distortion it had undergone under the influence of the resistance. But, owing to its nature as a symptom, it must nevertheless have a certain similarity to what we were in search of; and if the resistance were not too great, we ought to be able to guess the latter from the former. The idea occurring to the patient must be in the nature of an *allusion* to the repressed element, like a representation of it in indirect speech.

We know cases in the field of normal mental life in which situations analogous to the one we have just assumed produce similar results. One such case is that of jokes. The problems of psychoanalytic technique have compelled me to investigate the technique of making jokes. I will give you one example of this – incidentally, a joke in English.

This is the anecdote.[1] Two not particularly scrupulous businessmen had succeeded, by dint of a series of highly risky enterprises, in amassing a large fortune, and they were now making efforts to push their way into good society. One method, which struck them as a likely one, was to have their portraits painted by the most celebrated and highly paid artist in the city, whose pictures had an immense reputation. The precious canvases were shown for the first time at a large evening party, and the
[31] two hosts themselves led the most influential connoisseur and art critic up to the wall on which the portraits were hanging side by side, in order to extract his admiring judgement on them. He studied the works for a long time, and then, shaking his head, as though there was something he had missed, pointed to the gap between the pictures and asked quietly: 'But where's the Saviour?'[2] I see you are all much amused at this joke. Let us now proceed to examine it. Clearly what the connoisseur meant to say was: 'You are a couple of rogues, like the two thieves between whom the Saviour was crucified.' But he did not say this. Instead he made a remark which seems at first sight strangely inappropriate and irrelevant, but

1 Cf. *Jokes and their Relation to the Unconscious*, 1905*c* [*RSE*, **8**, 65–6, where the story is discussed at greater length and, incidentally, described as an American one].

2 [In English in the original.]

which we recognize a moment later as an *allusion* to the insult that he had in mind and as a perfect substitute for it. We cannot expect to find in jokes *all* the characteristics that we have attributed to the ideas occurring to our patients, but we must stress the identity of the *motive* [*Motivierung*] for the joke and for the idea. Why did the critic not tell the rogues straight out what he wanted to say? Because he had excellent countermotives working against his desire to say it to their faces. There are risks attendant upon insulting people who are one's hosts and who have at their command the fists of a large domestic staff. One might easily meet with the fate which I suggested in my last lecture as an analogy for repression. That was the reason why the critic did not express the insult he had in mind directly but in the form of an 'allusion accompanied by omission';[1] and the same state of things is responsible for our patients' producing a more or less distorted *substitute* instead of the forgotten idea we are in search of.

It is highly convenient, ladies and gentlemen, to follow the Zürich school (Bleuler, Jung, etc.) in describing a group of interdependent ideational elements cathected with affect as a 'complex'. We see, then, that if in our search for a repressed complex in one of our patients we start out from the last thing he remembers, we shall have every prospect of discovering the complex, provided that the patient puts a sufficient number of his free associations[2] at our disposal. Accordingly, we allow the patient [32]
to say whatever he likes, and hold fast to the postulate that nothing can occur to him which is not in an indirect fashion dependent on the complex we are in search of. If this method of discovering what is repressed strikes you as unduly circumstantial, I can at least assure you that it is the only practicable one.

When we come to putting this procedure into effect, we are subject to yet another interference. For the patient will often pause and come to a stop, and assert that he can think of nothing to say, and that nothing whatever occurs to his mind. If this were so and if the patient were right, then our procedure would once again have proved ineffective. But closer observation shows that such a stoppage of the flow of ideas never in fact occurs. It *appears* to happen only because the patient holds back or gets rid of the idea that he has become aware of, under the influence of the resistances which disguise themselves as various critical judgements

1 [This is one of the particular techniques described in the passage in Freud's book on *Jokes* (1905*c*) where the present anecdote occurs; *RSE*, **8**, 65 ff.]

2 [See footnote, p. 29 above.]

about the value of the idea that has occurred to him. We can protect ourselves against this by warning him beforehand of this behaviour and requiring him to take no notice of such criticisms. He must, we tell him, entirely renounce any critical selection of this kind and say whatever comes into his head, even if he considers it incorrect or irrelevant or nonsensical, and above all if he finds it disagreeable to let himself think about what has occurred to him. So long as this ordinance is carried out we are certain of obtaining the material which will put us on the track of the repressed complexes.

This associative material, which the patient contemptuously rejects when he is under the influence of the resistance instead of under the doctor's, serves the psychoanalyst, as it were, as ore from which, with the help of some simple interpretative devices, he extracts its content of precious metal. If you are anxious to gain a rapid and provisional knowledge of a patient's repressed complexes, without as yet entering into their arrangement and interconnection, you will employ as a method of examination the 'association experiment' as it has been developed by Jung (1906) and his pupils. This procedure offers the psychoanalyst what qualitative analysis offers the chemist. In the treatment of neurotic patients it can be dispensed with; but it is indispensable for the objective
[33] demonstration of complexes and in the examination of the psychoses, which has been embarked on with so much success by the Zürich school.

Working over the ideas that occur to patients when they submit to the main rule of psychoanalysis is not our only technical method of discovering the unconscious. The same purpose is served by two other procedures: the interpretation [*Deutung*][T] of patients' dreams and the exploitation of their faulty and haphazard actions [*Fehl- und Zufallshandlungen*][T].

Fehlleistung

I must admit, ladies and gentlemen, that I hesitated for a long time whether, instead of giving you this condensed general survey of the whole field of psychoanalysis, it might not be better to present you with a detailed account of dream interpretation.[1] I was held back by a purely subjective and seemingly secondary motive. It seemed to me almost indecent in a country which is devoted to practical aims to make my appearance as a 'dream interpreter', before you could possibly know the importance that can attach to that antiquated and derided art. The interpretation of dreams is in fact the royal road to a knowledge of

1 *The Interpretation of Dreams* (1900*a*).

the unconscious;[1] it is the securest foundation of psychoanalysis and the field in which every worker must acquire his convictions and seek his training. If I am asked how one can become a psychoanalyst, I reply: 'By studying one's own dreams.' Every opponent of psychoanalysis hitherto has, with a nice discrimination, either evaded any consideration of *The Interpretation of Dreams*, or has sought to skirt over it with the most superficial objections. If, on the contrary, you can accept the solutions of the problems of dream life, the novelties with which psychoanalysis confronts your minds will offer you no further difficulties.

You should bear in mind that the dreams which we produce at night have, on the one hand, the greatest external similarity and internal kinship with the creations of insanity, and are, on the other hand, compatible with complete health in waking life. There is nothing paradoxical in the assertion that no-one who regards these 'normal' illusions, delusions and character changes with astonishment instead of comprehension has the slightest prospect of understanding the abnormal structures [*Bildungen*][T] of pathological mental states otherwise than as a layman. You may comfortably count almost all psychiatrists among such laymen. [34]

I invite you now to follow me on a brief excursion through the region of dream problems. When we are awake we are in the habit of treating dreams with the same contempt with which patients regard the associations that are demanded of them by the psychoanalyst. We dismiss them, too, by forgetting them as a rule, quickly and completely. Our low opinion of them is based on the strange character even of those dreams that are not confused and meaningless, and on the obvious absurdity and nonsensicalness of other dreams. Our dismissal of them is related to the uninhibited shamelessness and immorality of the tendencies openly exhibited in some dreams. It is well known that the ancient world did not share this low opinion of dreams. Nor are the lower strata of our own society today in any doubt about the value of dreams; like the peoples of antiquity, they expect them to reveal the future. I confess that I feel no necessity for making any mystical assumptions in order to fill the gaps in our present knowledge, and accordingly I have never been able to find anything to confirm the prophetic nature of dreams. There are plenty of other things – sufficiently wonderful too – to be said about them.

In the first place, not all dreams are alien to the dreamer, incomprehensible and confused. If you inspect the dreams of very young

1 [This phrase was introduced in almost identical words into the second (1909) edition of *The Interpretation of Dreams* (*RSE*, **5**, 544).]

children, from eighteen months upwards, you will find them perfectly simple and easy to explain. Small children always dream of the fulfilment of wishes that were aroused in them the day before but not satisfied. You will need no interpretative art in order to find this simple solution; all you need do is to enquire into the child's experiences on the previous day (the 'dream day'). Certainly the most satisfactory solution of the riddle of dreams would be to find that adults' dreams too were like those of children – fulfilments of wishful impulses that had come to them on the dream day. And such, in fact, is the case. The difficulties in the way of this solution can be overcome step by step if dreams are analysed more closely.

The first and most serious objection is that the content of adults' [35] dreams is as a rule unintelligible and could not look more unlike the fulfilment of a wish. And here is the answer. Such dreams have been subjected to distortion; the psychical process underlying them might originally have been expressed in words quite differently. You must distinguish the *manifest content of the dream*, as you vaguely recollect it in the morning and laboriously (and, as it seems, arbitrarily) clothe it in words, and the *latent dream thoughts*, which you must suppose were present in the unconscious. This distortion in dreams is the same process that you have already come to know in investigating the formation [*Bildung*] of hysterical symptoms. It indicates, too, that the same interplay of mental forces is at work in the formation of dreams as in that of symptoms. The manifest content of the dream is the distorted substitute for the unconscious dream thoughts and this distortion is the work of the ego's forces of defence – of resistances. In waking life these resistances altogether prevent the repressed wishes of the unconscious from entering consciousness; and during the lowered state of sleep they are at least strong enough to oblige them to adopt a veil of disguise. Thereafter, the dreamer can no more understand the meaning of his dreams than the hysteric can understand the connection and significance of his symptoms.

You can convince yourself that there are such things as latent dream thoughts and that the relation between them and the manifest content of the dream is really as I have described it, if you carry out an analysis of dreams, the technique of which is the same as that of psychoanalysis. You entirely disregard the apparent connections between the elements in the manifest dream and collect the ideas that occur to you in connection with each separate element of the dream by free association [*freier Assoziation*] according to the psychoanalytic rule of procedure. From

this material you arrive at the latent dream thoughts, just as you arrived at the patient's hidden complexes from his associations to his symptoms and memories. The latent dream thoughts which have been reached in this way will at once show you how completely justified we have been in tracing back adults' dreams to children's dreams. The true meaning of the dream, which has now taken the place of its manifest content, is always clearly intelligible; it has its starting point in experiences of the previous day, and proves to be a fulfilment of unsatisfied wishes. The manifest dream, which you know from your memory when you [36] wake up, can therefore only be described as a *disguised* fulfilment of *repressed* wishes.

You can also obtain a view, by a kind of synthetic work, of the process which has brought about the distortion of the unconscious dream thoughts into the manifest content of the dream. We call this process the 'dream-work'. It deserves our closest theoretical interest, since we are able to study in it, as nowhere else, what unsuspected psychical processes can occur in the unconscious, or rather, to put it more accurately, *between* two separate psychical systems like the conscious and unconscious. Among these freshly discovered psychical processes those of *condensation* [*Verdichtung*][T] and *displacement* [*Verschiebung*][T] are especially noticeable. The dream-work is a special case of the effects produced by two different mental groupings on each other – that is, of the consequences of mental splitting; and it seems identical in all essentials to the process of distortion which transforms the repressed complexes into symptoms where there is unsuccessful repression.

You will also learn with astonishment from the analysis of dreams (and most convincingly from that of your own) what an unsuspectedly great part is played in human development by impressions and experiences of early childhood. In dream life the child that is in man pursues its existence, as it were, and retains all its characteristics and wishful impulses, even such as have become unserviceable in later life. There will be brought home to you with irresistible force the many developments, repressions, sublimations and reaction-formations, by means of which a child with a quite other innate endowment grows into what we call a normal man, the bearer, and in part the victim, of the civilization [*Kultur*][T] that has been so painfully acquired.

I should like you to notice, too, that the analysis of dreams has shown us that the unconscious makes use of a particular symbolism, especially for representing sexual complexes. This symbolism varies partly from individual to individual; but partly it is laid down in a

typical form and seems to coincide with the symbolism which, as we suspect, underlies our myths and fairy tales. It seems not impossible that these creations of the popular mind might find an explanation through the help of dreams.

Lastly, I must warn you not to let yourselves be put out by the objection that the occurrence of anxiety dreams contradicts our view of
[37] dreams as the fulfilments of wishes. Apart from the fact that these anxiety dreams, like the rest, require interpretation before any judgement can be formed on them, it must be stated quite generally that the anxiety does not depend on the content of the dream in such a simple manner as one might imagine without having more knowledge and taking more account of the determinants of neurotic anxiety. Anxiety is one of the ego's reactions in repudiation of repressed wishes that have become powerful; and its occurrence in dreams as well is very easily explicable when the formation of the dream has been carried out with too much of an eye to the fulfilment of these repressed wishes.

As you see, research into dreams would be justified for its own sake merely by the information it gives us on matters that can with difficulty be discovered in other ways. But we were in fact led to the subject in connection with the psychoanalytic treatment of neurotics. You will easily understand from what I have already said how it is that dream interpretation, if it is not made too difficult by the patient's resistances, leads to a knowledge of his hidden and repressed wishes and of the complexes nourished by them; and I can now pass on to the third group of mental phenomena whose study has become one of the technical instruments of psychoanalysis.

The phenomena in question are the small faulty actions performed by both normal and neurotic people, to which as a rule no importance is attached: forgetting [*Vergessen*] things that might be known and sometimes, in fact, *are* known (e.g. the occasional difficulty in recalling proper names), slips of the tongue [*Versprechen*] in talking, by which we ourselves are so often affected, analogous slips of the pen [*Verschreiben*] and misreadings [*Verlesen*], bungling the performance of actions [*Vergreifen*], losing objects or breaking [*Verlieren oder Zerbrechen*] them. All of these are things for which as a rule no psychological determinants are sought and which are allowed to pass without criticism as consequences of distraction or inattention or similar causes. Besides these there are the actions and gestures which people carry out without noticing them at all, to say nothing of attributing any psychological importance to them: playing about and fiddling with things, humming

tunes, fingering parts of one's own body or one's clothing and so on.[1] These small things, faulty actions and symptomatic or haphazard actions alike, are not so insignificant as people, by a sort of conspiracy of silence, are ready to suppose. They always have a meaning, which can usually be [38] interpreted with ease and certainty from the situation in which they occur. And it turns out that once again they give expression to impulses and intentions which have to be kept back and hidden from one's own consciousness, or that they are actually derived from the same repressed wishful impulses and complexes which we have already come to know as the creators of symptoms and the constructors of dreams. They therefore deserve to be rated as symptoms, and if they are examined they may lead, just as dreams do, to the uncovering of the hidden part of the mind. A man's most intimate secrets are as a rule betrayed by their help. If they occur particularly easily and frequently even in healthy people in whom the repression of unconscious impulses has on the whole been quite successful, they have their triviality and inconspicuousness to thank for it. But they can claim a high theoretical value, since they prove that repression and the formation of substitutes occur even under healthy conditions.

As you already see, psychoanalysts are marked by a particularly strict belief in the determination of mental life. For them there is nothing trivial, nothing arbitrary or haphazard. They expect in every case to find sufficient motives where, as a rule, no such expectation is raised. Indeed, they are prepared to find *several* motives for one and the same mental occurrence, whereas what seems to be our innate craving for causality declares itself satisfied with a *single* psychical cause.

If you will now bring together the means we possess for uncovering what is concealed, forgotten and repressed in the mind (the study of the ideas [*Einfälle*] occurring to patients under free association [*freier Association*], of their dreams and of their faulty and symptomatic actions), and if you will add to these the exploitation of certain other phenomena which occur during psychoanalytic treatment and on which I shall have a few remarks to make later under the heading of 'transference' ['*Übertragung*'][T] – if you bear all these in mind, you will agree with me in concluding that our technique is already efficient enough to fulfil its task, to bring the pathogenic psychical material into consciousness and so to get rid of the ailments that have been brought about by the formation of substitutive symptoms. And if, in the course of our therapeutic

1 Cf. *The Psychopathology of Everyday Life* (1901*b*) [*RSE*, **6**].

[39] endeavours, we extend and deepen our knowledge of the human mind both in health and sickness, that can, of course, only be regarded as a peculiar attraction in our work.

You may have formed an impression that the technique through whose armoury I have just conducted you is particularly difficult. In my opinion that technique is entirely in conformity with the material with which it has to deal. But this much at least is clear: it is not a self-evident one and it must be learnt just as the techniques of histology or surgery must be learnt. You will perhaps be surprised to hear that in Europe we have heard a large number of judgements on psychoanalysis from people who know nothing of this technique and do not employ it; and who go on to demand with apparent scorn that we shall prove to them the correctness of our findings. Among these adversaries there are no doubt some to whom a scientific mode of thought is not as a rule alien, who, for instance, would not reject the results of a microscopic examination because it could not be confirmed on the anatomical preparation with the naked eye, but who would first form a judgement on the matter themselves with the help of a microscope. But, where psychoanalysis is concerned, the prospects of recognition are in truth less favourable. Psychoanalysis is seeking to bring to conscious recognition the things in mental life which are repressed; and everyone who forms a judgement on it is himself a human being, who possesses similar repressions and may perhaps be maintaining them with difficulty. They are therefore bound to call up the same resistance in him as in our patients; and that resistance finds it easy to disguise itself as an intellectual rejection and to bring up arguments like those which we ward off in our patients by means of the fundamental rule of psychoanalysis. We often become aware in our opponents, just as we do in our patients, that their power of judgement is very noticeably influenced affectively in the sense of being diminished. The arrogance of consciousness (in rejecting dreams with such contempt, for instance) is one of the most powerful of the devices with which we are provided as a universal protection against the incursion of unconscious complexes. That is why it is so hard to convince people of the reality of the unconscious and to teach them to recognize something new which is in contradiction to their conscious knowledge.

FOURTH LECTURE

Ladies and Gentlemen, you will want to know now what we have found [40]
out about the pathogenic complexes and repressed wishful impulses of neurotics with the help of the technical methods I have described.

First and foremost we have found out one thing. Psychoanalytic research traces back the symptoms of patients' illnesses with really surprising regularity to impressions from their *erotic life*. It shows us that the pathogenic wishful impulses are in the nature of erotic drive components [*Triebkomponenten*][T]; and it forces us to suppose that *Trieb*
among the influences leading to the illness the predominant significance must be assigned to erotic disturbances, and that this is the case in both sexes.

I am aware that this assertion of mine will not be willingly believed. Even workers who are ready to follow my psychological studies are inclined to think that I overestimate the part played by sexual factors; they meet me with the question why *other* mental excitations should not lead to the phenomena I have described of repression and the formation of substitutes. I can only answer that I do not know why they should not, and that I should have no objection to their doing so; but experience shows that they do not carry this weight, that at most they *support* the operation of the sexual factors but cannot replace them. Far from this position having been postulated by me theoretically, at the time of the joint publication of the *Studies* with Dr Breuer in 1895 I had not yet adopted it; and I was converted to it only when my experiences became more numerous and penetrated into the subject more deeply. There are among my present audience a few of my closest friends and followers, who have travelled with me here to Worcester. Enquire from them, and you will hear that they all began by completely disbelieving my assertion that sexual aetiology was of decisive importance, until their own analytic experiences compelled them to accept it.

A conviction of the correctness of this thesis was not precisely made easier by the behaviour of patients. Instead of willingly presenting us with information about their sexual life, they try to conceal it by every [41]
means in their power. People are in general not candid over sexual matters. They do not show their sexuality freely, but to conceal it they wear a heavy overcoat woven of a tissue of lies, as though the weather were bad in the world of sexuality. Nor are they mistaken. It is a fact that sun

and wind are not favourable to sexual activity in this civilized world of ours; none of us can reveal his erotism freely to others. But when your patients discover that they can feel quite easy about it while they are under your treatment, they discard this veil of lies, and only then are you in a position to form a judgement on this debatable question. Unluckily even doctors are not preferred above other human creatures in their personal relation to questions of sexual life, and many of them are under the spell of the combination of prudery and prurience which governs the attitude of most 'civilized people' in matters of sexuality.

Let me now proceed with my account of our findings. In another set of cases psychoanalytic investigation traces the symptoms back, it is true, not to sexual experiences but to commonplace traumatic ones. But this distinction loses its significance owing to another circumstance. For the work of analysis required for the thorough explanation and complete recovery of a case never comes to a stop at events that occurred at the time of the onset of the illness, but invariably goes back to the patient's puberty and early childhood; and it is only there that it comes upon the impressions and events which determined the later onset of the illness. It is only experiences in childhood that explain susceptibility to later traumas and it is only by uncovering these almost invariably forgotten memory traces and by making them conscious that we acquire the power [*Macht*] to get rid of the symptoms. And here we reach the same conclusion as in our investigation of dreams: the imperishable, repressed wishful impulses of childhood have alone provided the power for the construction of symptoms, and without them the reaction to later traumas would have taken a normal course. But these powerful wishful impulses of childhood may without exception be described as sexual.

[42] And now at last I am quite certain that I have surprised you. 'Is there such a thing, then, as infantile sexuality?' you will ask. 'Is not childhood on the contrary the period of life that is marked by the absence of the sexual drive?' No, gentlemen, it is certainly not the case that the sexual drive enters into children at the age of puberty in the way in which, in the Gospel, the Devil entered into the swine. A child has its sexual drives and activities from the first; it comes into the world with them; and, after an important course of development passing through many stages, they lead to what is known as the normal sexuality of the adult. There is even no difficulty in observing the manifestations of these sexual activities in children; on the contrary, it calls for some skill to overlook them or explain them away.

By a lucky chance I am in a position to call a witness in favour of my assertions from your very midst. I have here in my hand a paper written by a Dr Sanford Bell, which was published in *The American Journal of Psychology* in 1902. The author is a Fellow of Clark University, of the very institution in whose lecture room we are now assembled. In this work, which is entitled 'A Preliminary Study of the Emotion of Love between the Sexes', and which appeared three years before my *Three Essays on the Theory of Sexuality* [1905*d*], the author says exactly what I have just told you: 'The emotion of sex-love . . . does not make its appearance for the first time at the period of adolescence, as has been thought.' He carried out his work in what we in Europe would call 'the American manner', collecting no fewer than 2,500 positive observations in the course of fifteen years, among them 800 of his own. Concerning the signs by which these instances of falling in love are revealed he writes as follows: 'The unprejudiced mind in observing these manifestations in hundreds of couples of children cannot escape referring them to sex origin. The most exacting mind is satisfied when to these observations are added the confessions of those who have, as children, experienced the emotion to a marked degree of intensity and whose memories of childhood are relatively distinct.' But those of you who do not wish to believe in infantile sexuality will be most of all surprised to hear that not a few of these children who have fallen in love so early are of the tender age of three, four and five.

It would not astonish me if you were to attach more credence to these observations made by one of your closest neighbours than to mine. I [43]
myself have recently been fortunate enough to obtain a fairly complete picture of the somatic drive manifestations and mental products at an early stage of a child's erotic life from the analysis of a five-year-old boy, suffering from anxiety – an analysis carried out with a correct technique by his own father.[1] And I may remind you that only a few hours ago, in this same room, my friend Dr C. G. Jung reported an observation to you made on a still younger girl who, with a precipitating cause similar to my patient's (the birth of a younger child in the family), made it possible to infer with certainty the presence of almost the same sensual impulses, wishes and complexes. [Cf. Jung, 1910*c*.][2] I do not despair, therefore, of your becoming reconciled to what seems at first sight the strange idea of infantile sexuality. And I should like to quote to you the

1 'The Analysis of a Phobia in a Five-Year-Old Boy' [Freud, 1909*b*; *RSE*, **10**, 5 ff.].

2 [In the original oral presentation of this lecture, the case of 'Little Hans' was mentioned not in the fourth but the fifth lecture, two hours after Jung presented his third (and final) lecture, on the case of a four-year-old girl. See Editors' Note, p. 4 above.]

praiseworthy example of the Zürich psychiatrist, Dr E. Bleuler, who declared publicly not many years ago that he was 'unable to comprehend my theories of sexuality', and who has since then confirmed the existence of infantile sexuality to its full extent from his own observations. (Cf. Bleuler, 1908.)

It is only too easy to explain why most people (whether medical observers or others) will hear nothing of the sexual life of children. They have forgotten their own infantile sexual activity under the pressure of their education to a civilized life [*Erziehung zur Kultur*][T], and they do not wish to be reminded of what has been repressed. They would arrive at other convictions if they were to begin their enquiry with a self-analysis, a revision and interpretation of their childhood memories.

Erziehung

Put away your doubts, then, and join me in a consideration of infantile sexuality from the earliest age.[1] A child's sexual drive turns out to be put together out of a number of factors; it is capable of being divided up into numerous components which originate from various sources. Above all, it is still independent of the reproductive function, into the service of which it will later be brought. It serves for the acquisition of different kinds of pleasurable feeling [*Lustempfindung*][T], which, basing ourselves on analogies and connections, we bring together under the idea of sexual pleasure. The chief source of infantile sexual pleasure is the appropriate excitation of certain parts of the body that are especially susceptible to stimulus: apart from the genitals, these are the oral, anal and urethral orifices, as well as the skin and other sensory surfaces. Since at this first phase of infantile sexual life satisfaction is obtained from the subject's own body and extraneous objects are disregarded, we term this phase (from a word coined by Havelock Ellis) that of *auto-erotism*. We call the parts of the body that are important in the acquisition of sexual pleasure 'erotogenic zones'. Thumbsucking (or sensual sucking) in the youngest infants is a good example of this auto-erotic satisfaction from an erotogenic zone. The first scientific observer of this phenomenon, a paediatrician in Budapest named Lindner (1879), already interpreted it correctly as sexual satisfaction and described exhaustively its transition to other and higher forms of sexual activity. Another sexual satisfaction at this period of life is the masturbatory excitation of the genitals, which retains so much importance in later life and by many people is never completely conquered. Alongside these and other auto-erotic activities,

Lust

[44]

1 Cf. *Three Essays on the Theory of Sexuality* (1905*d*) [*RSE*, 7].

we find in children at a very early age manifestations of those drive components of sexual pleasure (or, as we like to say, of libido) which presuppose the taking of an extraneous person as an object. These drives occur in pairs of opposites, active and passive. I may mention as the most important representatives of this group the desire to cause pain (sadism) with its passive counterpart (masochism) and the active and passive desire for looking [*Schaulust*][T], from the former of which curiosity branches off later on and from the latter the impulsion to artistic and theatrical display. Others of a child's sexual activities already imply the making of an 'object choice', where an extraneous person becomes the main feature, a person who owes his importance in the first instance to considerations arising from the self-preservative drive. But at this early period of childhood difference in sex plays no decisive part as yet. Thus you can attribute some degree of homosexuality to every child without doing him an injustice. This widespread and copious but dissociated sexual life of children, in which each separate drive pursues its own acquisition of pleasure independently of all the rest, is now brought together and organized in two main directions, so that by the end of puberty the individual's final sexual character is as a rule completely formed. On the one hand, the separate drives become subordinated to the dominance of the genital zone, so that the whole sexual life enters the service of reproduction, and the satisfaction of the separate drives retains its importance only as preparing for and encouraging the sexual act proper. On the other hand, object choice pushes autoerotism into the background, so that in the subject's erotic life all the components of the sexual drive now seek satisfaction in relation to the person who is loved. Not all of the original sexual components, however, are admitted to take part in this final establishment of sexuality. Even before puberty extremely energetic repressions of certain drives have been effected under the influence of education, and mental forces such as shame, disgust and morality have been set up, which, like watchmen, maintain these repressions. So that when at puberty the high tide of sexual demands is reached, it is met by these mental reactive or resistant structures like dams, which direct its flow into what are called normal channels and make it impossible for it to reactivate the drives that have undergone repression. It is, in particular, the coprophilic impulses of childhood – that is to say, the desires attaching to the excreta – which are submitted the most rigorously to repression, and the same is true, furthermore, of fixation to the figures to which the child's original object choice was attached. [45]

There is a dictum in general pathology, gentlemen, which asserts that every developmental process carries with it the seed of a pathological disposition, insofar as that process may be inhibited, delayed, or may run its course incompletely. The same thing is true of the highly complicated development of the sexual function. It does not occur smoothly in every individual; and, if not, it leaves behind it either abnormalities or a predisposition to fall ill later, along the path of involution (i.e. regression). It may happen that not all the component drives submit to the dominance of the genital zone. A drive which remains in this way independent leads to what we describe as a *perversion*, and may substitute its own sexual aim for the normal one. It very often happens, as I have already said, that auto-erotism is not completely conquered, and evidence of this is given by a great variety of
[46] subsequent disturbances. The originally equal value attached to the two sexes as sexual objects may persist, and this will lead to a tendency in adult life to homosexual activity, which can in certain circumstances be intensified into exclusive homosexuality. These classes of disturbance represent direct inhibitions in the development of the sexual function; they comprise the perversions and, what is by no means rare, general infantilism in sexual life.

The predisposition to *neurosis* is traceable to impaired sexual development in a different way. Neuroses are related to perversions as negative to positive. The same drive components as in the perversions can be observed in the neuroses as vehicles of complexes and constructors of symptoms, but in the latter case they operate from the unconscious. Thus they have undergone repression, but have been able, in defiance of it, to persist in the unconscious. Psychoanalysis makes it clear that an excessively strong manifestation of these drives at a very early age leads to a kind of partial *fixation*, which then constitutes a weak point in the structure of the sexual function. If in maturity the performance of the normal sexual function comes up against obstacles, the repression that took place during the course of development will be broken through at the precise points at which the infantile fixations occurred.

But here you will perhaps protest that all this is not sexuality. I have been using the word in a far wider sense than that in which you have been accustomed to understand it. So much I am quite ready to grant you. But the question arises whether it is not rather you who have been using the word in far too narrow a sense by restricting it to the sphere of reproduction. It means that you are sacrificing an understanding of the perversions and the connection between the perversions, the neuroses

and normal sexual life; and you are making it impossible for you to recognize in its true significance the easily observable beginnings of the somatic and mental erotic life of children. But however you may choose to decide the verbal usage, you should bear firmly in mind that psychoanalysts understand sexuality in the full sense to which one is led by a consideration of infantile sexuality.

Let us return to the sexual development of children. We have some arrears to make up owing to our having paid more attention to the [47] somatic than to the mental phenomena of sexual life. The child's first choice of an object, which derives from its need for help, claims our further interest. Its choice is directed in the first instance to all those who look after it, but these soon give place to its parents. Children's relations to their parents, as we learn alike from direct observations of children and from later analytic examination of adults, are by no means free from elements of accompanying sexual excitation. The child takes both of its parents, and more particularly one of them, as the object of its erotic wishes. In so doing, it usually follows some indication from its parents, whose affection bears the clearest characteristics of a sexual activity, even though of one that is inhibited in its aims. As a rule a father prefers his daughter and a mother her son; the child reacts to this by wishing, if he is a son, to take his father's place, and, if she is a daughter, her mother's. The feelings which are aroused in these relations between parents and children and in the resulting ones between brothers and sisters are not only of a positive or affectionate kind but also of a negative or hostile one. The complex which is thus formed is doomed to an early repression; but it continues to exercise a great and lasting influence from the unconscious. It is to be suspected that, together with its extensions, it constitutes the *nuclear complex* of every neurosis, and we may expect to find it no less actively at work in other regions of mental life. The myth of King Oedipus, who killed his father and took his mother as his wife, reveals, with little modification, the infantile wish, which is later opposed and repudiated by the *barrier against incest*. Shakespeare's *Hamlet* is equally rooted in the soil of the incest complex, but under a better disguise.[1]

During the time when the child is dominated by the still unrepressed nuclear complex, an important part of his intellectual activity is brought into the service of his sexual interests. He begins to enquire where babies

1 [Freud adopted the term 'Oedipus complex' for the first time shortly after these lectures were delivered, in the first of his 'Contributions to the Psychology of Love' (1910*h*). See below, p. 158.]

come from, and, on the basis of the evidence presented to him, guesses more of the true facts than the grown-ups imagine. His interest in these researches is usually set going by the very real threat offered to him by
[48] the arrival of a new baby, which to begin with he regards merely as a competitor. Under the influence of the component drives that are active in himself, he arrives at a number of 'infantile sexual theories' – such as attributing a male genital organ to both sexes alike, or supposing that babies are conceived by eating and born through the end of the bowel, or regarding sexual intercourse as a hostile act, a kind of violent subjugation. But as a result precisely of the incompleteness of his sexual constitution, and of the gap in his knowledge due to the hidden nature of the female sexual channel, the young investigator is obliged to abandon his work as a failure. The fact of this childish research itself, as well as the different infantile sexual theories that it brings to light, remain of importance in determining the formation of the child's character and the content of any later neurotic illness.

It is inevitable and perfectly normal that a child should take his parents as the first objects of his love. But his libido should not remain fixated to these first objects; later on, it should merely take them as a model, and should make a gradual transition from them on to extraneous people when the time for the final choice of an object arrives. The detachment of the child from his parents is thus a task that cannot be evaded if the young individual's social fitness is not to be endangered. During the time at which repression is making its selection among the component drives, and later, when there should be a slackening of the parents' influence, which is essentially responsible for the expenditure of energy on these repressions, the task of education meets with great problems, which at the present time are certainly not always dealt with in an understanding and unobjectionable manner.

You must not suppose, ladies and gentlemen, that these discussions on sexual life and the psychosexual development of children have led us too far from psychoanalysis and the problem of curing nervous disorders. You can, if you like, regard psychoanalytic treatment as no more than a prolongation of education for the purpose of overcoming the residues of childhood.

FIFTH LECTURE

Ladies and Gentlemen, with the discovery of infantile sexuality and the [49]
tracing back of neurotic symptoms to erotic drive components we have arrived at some unexpected formulas concerning the nature and purposes of neurotic illnesses. We see that human beings fall ill when, as a result of external obstacles or of an internal lack of adaptation, the satisfaction of their erotic needs *in reality* is frustrated [*versagt ist*]. We see that they then take flight into *illness* in order that by its help they may find a satisfaction to take the place of what has been frustrated. We recognize that the pathological symptoms constitute a portion of the subject's sexual activity or even the whole of his sexual life, and we find that the withdrawal from reality is the main purpose of the illness but also the main damage caused by it. We suspect that our patients' resistance to recovery is no simple one, but compounded of several motives. Not only does the patient's ego rebel against giving up the repressions by means of which it has risen above its original disposition, but the sexual drives are unwilling to renounce their substitutive satisfaction so long as it is uncertain whether reality will offer them anything better.

The flight from unsatisfactory reality into what, on account of the biological damage involved, we call illness (though it is never without an immediate yield of pleasure to the patient) takes place along the path of involution, of regression, of a return to earlier phases of sexual life, phases from which at one time satisfaction was not withheld. This regression appears to be a twofold one: a *temporal* one, insofar as the libido, the erotic needs, hark back to stages of development that are earlier in time, and a *formal* one, in that the original and primitive methods of psychical expression are employed in manifesting those needs. Both these kinds of regression, however, lead back to childhood and unite in bringing about an infantile condition of sexual life.[1]

The deeper you penetrate into the pathogenesis of nervous illness, the more you will find revealed the connection between the neuroses and other productions of the human mind, including the most valuable. You will be taught that we humans, with the high standards of our civilization [50]
and under the pressure of our internal repressions, find reality unsatisfying quite generally, and for that reason entertain a life of phantasy in

1 [Freud's use of the concept of regression is discussed at length in an Editors' Appendix to Part I of the 'Project' (1950*a*), *RSE*, **1**, 369 ff.]

which we like to make up for the insufficiencies of reality by the production of wish fulfilments. These phantasies include a great deal of the true constitutional essence of the subject's personality as well as of those of his impulses which are repressed where reality is concerned. The energetic and successful man is one who succeeds by his efforts in turning his wishful phantasies into reality. Where this fails, as a result of the resistances of the external world and of the subject's own weakness, he begins to turn away from reality and withdraws into his more satisfying world of phantasy, the content of which is transformed into symptoms should he fall ill. In certain favourable circumstances, it still remains possible for him to find another path leading from these phantasies to reality, instead of becoming permanently estranged from it by regressing to infancy. If a person who is at loggerheads with reality possesses an *artistic gift* (a thing that is still a psychological mystery to us), he can transform his phantasies into artistic creations instead of into symptoms. In this manner he can escape the doom of neurosis and by this roundabout path regain his contact with reality. (Cf. Rank, 1907.) If there is persistent rebellion against the real world and if this precious gift is absent or insufficient, it is almost inevitable that the libido, keeping to the sources of the phantasies, will follow the path of regression, and will revive infantile wishes and end in neurosis. Today neurosis takes the place of the monasteries which used to be the refuge of all whom life had disappointed or who felt too weak to face it.

Let me at this point state the principal finding to which we have been led by the psychoanalytic investigation of neurotics. The neuroses have no psychical content that is peculiar to them and that might not equally be found in healthy people. Or, as Jung has expressed it, neurotics fall ill of the same complexes against which we healthy people struggle as well. Whether that struggle ends in health, in neurosis, or in a countervailing superiority of achievement depends on *quantitative* considerations, on the relative strength of the conflicting forces.

[51] I have not yet told you, ladies and gentlemen, of the most important of the observations which confirm our hypothesis of the sexual drive forces operating in neuroses. In every psychoanalytic treatment of a neurotic patient the strange phenomenon that is known as 'transference' makes its appearance. The patient, that is to say, directs towards the physician a degree of affectionate feeling [*Regungen*] (mingled, often enough, with hostility) which is based on no real relation between them and which – as is shown by every detail of its emergence – can only be

traced back to old wishful phantasies of the patient's which have become unconscious. Thus the part of the patient's emotional life which he can no longer recall to memory is re-experienced by him in his relation to the physician; and it is only this re-experiencing in the 'transference' that convinces him of the existence and of the power of these unconscious sexual impulses. His symptoms, to take an analogy from chemistry, are precipitates of earlier experiences in the sphere of love (in the widest sense of the word), and it is only in the raised temperature of his experience of the transference that they can be resolved and reduced to other psychical products. In this reaction the physician, if I may borrow an apt phrase from Ferenczi (1909), plays the part of a catalytic ferment, which temporarily attracts to itself the affects liberated in the process. A study of transference, too, can give you the key to an understanding of hypnotic suggestion, which we employed to begin with as a technical method for investigating the unconscious in our patients. At that time hypnosis was found to be a help therapeutically, but a hindrance to the scientific understanding of the facts; for it cleared away the psychical resistances in a certain area while building them up into an unscalable wall at its frontiers. You must not suppose, moreover, that the phenomenon of transference (of which, unfortunately, I can tell you all too little today) is *created* by psychoanalytic influence. Transference arises spontaneously in all human relationships just as it does between the patient and the physician. It is everywhere the true vehicle of therapeutic influence; and the less its presence is suspected, the more powerfully it operates. So psychoanalysis does not create it, but merely reveals it to consciousness and gains control of it in order to guide psychical processes towards the desired goal. I cannot, however, leave the topic of transference without stressing the fact that this phenomenon plays a decisive part in bringing conviction not only to [52] the patient but also to the physician. I know it to be true of all my followers that they were only convinced of the correctness of my assertions on the pathogenesis of the neuroses by their experiences with transference; and I can very well understand that such certainty of judgement cannot be attained before one has carried out psychoanalyses and has oneself observed the workings of transference.

Ladies and gentlemen, from the intellectual point of view we must, I think, take into account two special obstacles to recognizing psychoanalytic trains of thought. In the first place, people are unaccustomed to reckoning with a strict and universal application of determinism to

mental life; and in the second place, they are ignorant of the peculiarities which distinguish unconscious mental processes from the conscious ones that are familiar to us. One of the most widespread resistances to psychoanalytic work, in the sick and healthy alike, can be traced to the second of these two factors. People are afraid of doing harm by psychoanalysis; they are afraid of bringing the repressed sexual drives into the patient's consciousness, as though that involved a danger of their overwhelming his higher ethical trends and of their robbing him of his cultural acquisitions.[1] People notice that the patient has sore spots in his mind, but shrink from touching them for fear of increasing his sufferings. We can accept this analogy. It is no doubt kinder not to touch diseased spots if it can do nothing else but cause pain. But, as we know, a surgeon does not refrain from examining and handling a focus of disease, if he is intending to take active measures which he believes will lead to a permanent cure. No-one thinks of blaming him for the inevitable suffering caused by the examination or for the reactions to the operation, if only it gains its end and the patient achieves a lasting recovery as a result of the temporary worsening of his state. The case is similar with psychoanalysis. It may make the same claims as surgery: the increase in suffering which it causes the patient during treatment is incomparably less than what a surgeon
[53] causes, and is quite negligible in proportion to the severity of the underlying ailment. On the other hand, the final outcome that is so much dreaded – the destruction of the patient's cultural character by the drives which have been set free from repression – is totally impossible. For alarm on this score takes no account of what our experiences have taught us with certainty – namely that the mental and somatic power of a wishful impulse, when once its repression has failed, is far stronger if it is unconscious than if it is conscious; so that to make it conscious can only be to weaken it. An unconscious wish cannot be influenced and it is independent of any contrary tendencies, whereas a conscious one is inhibited by whatever else is conscious and opposed to it. Thus the work of psychoanalysis puts itself at the orders of precisely the highest and most valuable cultural trends, as a better substitute for the unsuccessful repression.

What, then, becomes of the unconscious wishes which have been set free by psychoanalysis? Along what paths do we succeed in making them harmless to the subject's life? There are several such paths. The most frequent outcome is that, while the work is actually going on, these

1 [The last nine words were omitted, probably as an oversight, in the *Gesammelte Schriften* (1924) and *Gesammelte Werke* (1942).]

wishes are destroyed by the rational mental activity of the better impulses that are opposed to them. *Repression* is replaced by a *condemning judgement* carried out along the best lines. That is possible because what we have to get rid of is to a great extent only the consequences arising from earlier stages of the ego's development. The subject succeeded in the past in repressing the unserviceable drive only because he himself was at that time still imperfectly organized and feeble. In his present-day maturity and strength, he will perhaps be able to master what is hostile to him with complete success.

A second outcome of the work of psychoanalysis is that it then becomes possible for the unconscious drives revealed by it to be employed for the useful purposes which they would have found earlier if development had not been interrupted. For the extirpation of the infantile wishful impulses is by no means the ideal aim of development. Owing to their repressions, neurotics have sacrificed many sources of mental energy whose contributions would have been of great value in the formation of their character and in their activity in life. We know of a far more expedient process of development, called '*sublimation*', in which the [54]
energy of the infantile wishful impulses is not cut off but remains ready for use – the unserviceable aim of the various impulses being replaced by one that is higher, and perhaps no longer sexual. It happens to be precisely the components of the *sexual* drive that are specially marked by a capacity of this kind for sublimation, for exchanging their sexual aim for another one which is comparatively remote and socially valuable. It is probable that we owe our highest cultural successes to the contributions of energy made in this way to our mental functions. Premature repression makes the sublimation of the repressed drive impossible; when the repression is lifted, the path to sublimation becomes free once more.

We must not omit to consider the third of the possible outcomes of the work of psychoanalysis. A certain portion of the repressed libidinal impulses has a claim to direct satisfaction and ought to find it in life. Our civilized standards make life too difficult for the majority of human organizations. Those standards consequently encourage the retreat from reality and the generating of neuroses, without achieving any surplus of cultural gain by this excess of sexual repression. We ought not to exalt ourselves so high as completely to neglect what was originally animal in our nature. Nor should we forget that the satisfaction of the individual's happiness cannot be erased from among the aims of our civilization. The plasticity of the components of sexuality, shown by their capacity for sublimation, may indeed offer a great temptation to strive for still

greater cultural achievements by still further sublimation. But, just as we do not count on our machines converting more than a certain fraction of the heat consumed into useful mechanical work, we ought not to seek to alienate the whole amount of the energy of the sexual drive from its proper ends. We cannot succeed in doing so; and if the restriction upon sexuality were to be carried too far it would inevitably bring with it all the evils of soil exhaustion.

It may be that you for your part will regard the warning with which I close as an exaggeration. I shall only venture on an indirect picture of my conviction by telling you an old story and leaving you to make what use you like of it. German literature is familiar with a little town called Schilda, to whose inhabitants clever tricks of every possible sort are
[55] attributed. The citizens of Schilda, so we are told, possessed a horse with whose feats of strength they were highly pleased and against which they had only one objection – that it consumed such a large quantity of expensive oats. They determined to break it of this bad habit very gently by reducing its ration by a few stalks every day, till they had accustomed it to complete abstinence. For a time things went excellently: the horse was weaned to the point of eating only one stalk a day, and on the succeeding day it was at length to work without any oats at all. On the morning of that day the spiteful animal was found dead; and the citizens of Schilda could not make out what it had died of.

We should be inclined to think that the horse was starved and that no work at all could be expected of an animal without a certain modicum of oats.

I must thank you for your invitation and for the attention with which you have listened to me.

APPENDIX

LIST OF EXPOSITORY WORKS BY FREUD

1904*a* [1903]	'Freud's Psychoanalytic Procedure'	[56]
1905*a* [1904]	'On Psychotherapy'	
1906*a* [1905]	'My Views on the Part Played by Sexuality in the Aetiology of the Neuroses'	
1910*a* [1909]	*Five Lectures on Psychoanalysis*	
1913*j*	'The Claims of Psychoanalysis to Scientific Interest'	
1913*m* [1911]	'On Psycho-Analysis' (Australasian Medical Congress)	
1914*d*	'On the History of the Psychoanalytic Movement'	
1916–17*a* [1915–17]	*Introductory Lectures on Psychoanalysis*	
1923*a* [1922]	Two Encyclopaedia Articles (Marcuse's *Handwörterbuch*)	
1924*f* [1923]	'A Short Account of Psychoanalysis' (*These Eventful Years*)	
1925*d* [1924]	*An Autobiographical Study* and Postscript (1935*a*)	
1926*e*	*The Question of Lay Analysis*	
1926*f*	'Psychoanalysis' (*Encyclopaedia Britannica*)	
1933*a* [1932]	*New Introductory Lectures on Psychoanalysis*	
1940*a* [1938]	*An Outline of Psychoanalysis*	
1940*b* [1938]	'Some Elementary Lessons in Psycho-Analysis'	
2006*e* [c. 1931]	*Thomas Woodrow Wilson: A Psychological Study* (Draft of the Opening Chapter)	

Leonardo da Vinci and a Memory of his Childhood

(1910)

EDITORS' NOTE

EINE KINDHEITSERINNERUNG DES LEONARDO DA VINCI

GERMAN EDITIONS

1910 Leipzig and Vienna: Deuticke. Pp. 71. (*Schriften zur angewandten Seelenkunde*, Heft 7.) [59]
1919 2nd ed. Same publishers. Pp. 76.
1923 3rd ed. Same publishers. Pp. 78.
1925 *GS*, **9**, 371–454.
1943 *GW*, **8**, 128–211.
1969 *SA*, **10**, 91–159. (Revised reprint of the *GW* edition.)

ENGLISH TRANSLATIONS

Leonardo da Vinci
1916 New York: Moffat, Yard. Pp. 130. (Tr. A. A. Brill.)
1922 London: Kegan Paul. Pp. v + 130. (Same translator, with a preface by Ernest Jones.)
1932 New York: Dodd Mead. Pp. 138. (Reissue of above.)
'Leonardo da Vinci and a Memory of his Childhood'
1957 *SE*, **11**, 63–137. (Tr. Alan Tyson.)
1985 *PFL*, **14**, 151–231. (Reprint of above.)
2003 *PMC*, *The Uncanny*, 43–120. (Tr. David McLintock.)

The present translation is a revised and corrected reprint of the *SE* version.

That Freud's interest in Leonardo was of long standing is shown by a sentence in a letter to Fliess of October 9, 1898 (Freud, 1950*a*, Letter 98), in which he remarked that 'perhaps the most famous left-handed individual was Leonardo, who is not known to have had any love affairs'.[1] This interest, furthermore, was not a passing one, for we find in Freud's reply to a 'questionnaire' on his favourite books (1906*f*) that he mentions among them Merezhkovsky's study of Leonardo. But the immediate stimulus to writing the present work appears to have come in the autumn of 1909 from

1 A connection between bilaterality and bisexuality had been asserted by Fliess but questioned by Freud. An indirect reference to this controversy (which was one of the occasions for their estrangement) can be found on p. 122 below.

[60] one of his patients who, as he remarked in a letter to Jung on October 17, seemed to have the same constitution as Leonardo without his genius. He added that he was obtaining a book on Leonardo's youth from Italy. This was the monograph by Scognamiglio first referred to on p. 64 *n.* 3 below. After reading this and some other books on Leonardo, he spoke on the subject to the Vienna Psychoanalytical Society on December 1; but it was not until the beginning of April, 1910, that he finished writing his study. It was published at the end of May.

Freud made a number of corrections and additions in the later issues of the book. Among these may be specially mentioned the short footnote on circumcision (p. 88 *n.* 2), the excerpt from Reitler (pp. 67–8 *n.* 4), and the long quotation from Pfister (p. 105 *n.*), all of them added in 1919, and the discussion of the London cartoon (p. 104 *n.*), added in 1923.

This work of Freud's was not the first application of the methods of clinical psychoanalysis to the lives of historical figures in the past. Experiments in this direction had already been made by others, notably by Sadger, who had published studies on Conrad Ferdinand Meyer (1908*b*), Lenau (1909*b*) and Kleist (1909*c*).[1] Freud himself had never before embarked on a full-length biographical study of this kind, though he had previously made a few fragmentary analyses of writers, based on episodes in their works. Long before this, in fact on June 20, 1898, he had sent Fliess a study of one of C. F. Meyer's short stories, 'Die Richterin', which threw light on its author's early life (Freud, 1950*a*, Letter 91). But this monograph on Leonardo was not only the first but also the last of Freud's large-scale excursions into the field of biography (if we exclude his contributions to Bullitt's psychological study of Woodrow Wilson; Freud, 1966*b*, 2006*e*, 2024*a*; *RSE*, **22**). The book seems to have been greeted with more than the usual amount of disapproval, and Freud was evidently justified in defending himself in advance with the reflections at the beginning of Chapter VI (p. 117 below) – reflections which have a general application even today to the authors and critics of biographies.

[61] It is a strange fact, however, that until the 1950s none of the critics of the present work seems to have lighted upon what is no doubt its weakest point. A prominent part is played by Leonardo's memory or phantasy of being visited in his cradle by a bird of prey. The name applied to this bird in his notebooks is '*nibio*', which (in the modern form of '*nibbio*') is the ordinary Italian word for 'kite'. Freud, however, throughout his study translates the word by the German '*Geier*', for which the English can only be 'vulture'.[2]

Freud's mistake seems to have originated from some of the German translations which he used. Thus Marie Herzfeld (1906) uses the word '*Geier*' in one of her versions of the cradle phantasy instead of '*Milan*', the normal German word for 'kite'. But probably the most important influence was the German translation of Merezhkovsky's Leonardo book which, as may be seen from the marked copy in Freud's library, was the source of a very great deal of his information about

1 The Minutes of the Vienna Psychoanalytical Society show that, in a meeting on December 11, 1907, Freud made some remarks on the subject of psychoanalytic biography. (Cf. Jones, 1955, 383.)

2 This was pointed out by Irma Richter in a footnote to her selection from Leonardo's Notebooks (1952, 286). Like Pfister (p. 105 *n.* below), she refers to Leonardo's childhood memory as a 'dream'.

Leonardo and in which he probably came across the story for the first time. Here too the German word used in the cradle phantasy is '*Geier*', though Merezhkovsky himself correctly used '*korshun*', the Russian word for 'kite'.

In face of this mistake, some readers may feel an impulse to dismiss the whole study as worthless. It will, however, be a good plan to examine the situation more coolly and consider in detail the exact respects in which Freud's arguments and conclusions are invalidated.

In the first place the 'hidden bird' in Leonardo's picture (p. 105 *n.* below) must be abandoned. If it is a bird at all, it is a vulture; it bears no resemblance to a kite. This 'discovery', however, was not made by Freud but by Pfister. It was not introduced until the second edition of the work, and Freud received it with considerable reserve.

Next, and more important, comes the Egyptian connection. The hieroglyph for the Egyptian word for 'mother' ('*mut*') quite certainly represents a vulture and not a kite. Gardiner in his authoritative *Egyptian Grammar* (2nd ed., 1950, 469) identifies the creature as '*Gyps fulvus*', the griffon vulture. It follows from this that Freud's [62]
theory that the bird of Leonardo's phantasy stood for his mother cannot claim direct support from the Egyptian myth, and that the question of his acquaintance with that myth ceases to be relevant.[1] The phantasy and the myth seem to have no immediate connection with each other. Nevertheless, each of them, taken independently, raises an interesting problem. How was it that the ancient Egyptians came to link up the ideas of 'vulture' and 'mother'? Does the Egyptologists' explanation that it is merely a matter of a chance phonetic coincidence meet the question? If not, Freud's discussion of androgynous mother goddesses must have a value of its own, irrespective of its connection with the case of Leonardo. So too Leonardo's phantasy of the bird visiting him in his cradle and putting its tail into his mouth continues to cry out for an explanation even if the bird was not a vulture. And Freud's psychological analysis of the phantasy is not contradicted by this correction but merely deprived of one piece of corroborative support.

Apart, then, from the consequent irrelevance of the Egyptian discussion – though this nevertheless retains much of its independent value – the main body of Freud's study is unaffected by his mistake: the detailed construction of Leonardo's emotional life from his earliest years, the account of the conflict between his artistic and his scientific impulses, the deep analysis of his psychosexual history. And, in addition to this main topic, the study presents us with a number of not less important side themes: a more general discussion of the nature and workings of the mind of the creative artist, an outline of the genesis of one particular type of homosexuality, and – of special interest to the history of psychoanalytic theory – the first full emergence of the concept of narcissism.

Finally, it is worth noting that Freud's own estimation of this work (in contrast to his usual depreciation of his writings) was that it was 'certainly the only pretty thing I have ever written' (letter to Ferenczi, February 13, 1919).

1 Nor can the story of the virginal impregnation of vultures serve as evidence of Leonardo's having had an exclusive bond with his mother in his infancy – though the existence of that bond is not contradicted by the failure of this particular evidence.

LEONARDO DA VINCI AND A MEMORY OF HIS CHILDHOOD

I

When psychiatric research, normally content to draw on frailer men for its material, approaches one who is among the greatest of the human race, it is not doing so for the reasons so frequently ascribed to it by laymen. 'To blacken the radiant and drag the sublime into the dust' is no part of its purpose,[1] and there is no satisfaction for it in narrowing the gulf which separates the perfection of the great from the inadequacy of the objects that are its usual concern. But it cannot help finding worthy of understanding everything that can be recognized in those illustrious models, and it believes there is no-one so great as to be disgraced by being subject to the laws which govern both normal and pathological activity with equal cogency. [63]

Leonardo da Vinci (1452–1519) was admired even by his contemporaries as one of the greatest men of the Italian Renaissance; yet in their time he had already begun to seem an enigma, just as he does to us today. He was a universal genius 'whose outlines can only be surmised – never defined'.[2] In his own time his most decisive influence was in painting, and it was left to us to recognize the greatness of the natural scientist (and engineer)[3] that was combined in him with the artist. Though he left behind him masterpieces of painting, while his scientific discoveries remained unpublished and unused, the investigator in him never in the course of his development left the artist entirely free, but often made severe encroachments on him and perhaps in the end suppressed him. In the last hour of his life, according to the words that [64]

1 [Es liebt die Welt, das Strahlende zu schwärzen
Und das Erhabene in den Staub zu ziehn.
(The world loves to blacken the radiant and drag the sublime into the dust.)
From a poem by Schiller, 'Das Mädchen von Orleans', inserted as an extra prologue to the 1801 edition of his play *Die Jungfrau von Orleans*. The poem is reputed to have been an attack on Voltaire's *La Pucelle*.]

2 The words are Jacob Burckhardt's, quoted by Konstantinowa (1907, [51]).

3 [The words in parentheses were added in 1923.]

Vasari gives him, he reproached himself with having offended God and man by his failure to do his duty in his art.[1] And even if this story of Vasari's has neither external nor much internal probability but belongs to the legend which began to be woven around the mysterious Master even before his death, it is still of incontestable value as evidence of what men believed at the time.

What was it that prevented Leonardo's personality from being understood by his contemporaries? The cause of this was certainly not the versatility of his talents and the range of his knowledge, which enabled him to introduce himself to the court of the Duke of Milan, Lodovico Sforza, called Il Moro, as a performer on a kind of lute of his own invention, or allowed him to write the remarkable letter to the same duke in which he boasted of his achievements as architect and military engineer. For the days of the Renaissance were quite familiar with such a combination of wide and diverse abilities in a single individual – though we must allow that Leonardo himself was one of the most brilliant examples of this. Nor did he belong to the type of genius who has received a niggardly outward endowment from Nature, and who in his turn places no value on the outward forms of life, but in a spirit of painful gloom flies from all dealings with mankind. On the contrary, he was tall and well proportioned; his features were of consummate beauty and his physical strength unusual; he was charming in his manner, supremely eloquent, and cheerful and amiable to everyone. He loved beauty in the things that surrounded him; he was fond of magnificent clothing and valued every refinement of living. In a passage from the treatise on painting, which reveals his lively capacity for enjoyment, he compares painting with its
[65] sister arts and describes the hardships that await the sculptor: 'For his face is smeared and dusted all over with marble powder so that he looks like a baker, and he is completely covered with little chips of marble, so that it seems as if his back had been snowed on; and his house is full of splinters of stone and dust. In the case of the painter it is quite different . . . for the painter sits in front of his work in perfect comfort. He is well dressed and handles the lightest of brushes which he dips in pleasant colours. He wears the clothes he likes; and his house is full of delightful paintings, and is spotlessly clean. He is often accompanied by music or by men who read from a variety of beautiful works, and he can

1 'Egli per reverenza, rizzatosi a sedere sul letto, contando il mal suo e gli accidenti di quello, mostrava tuttavia, quanto aveva offeso Dio e gli uomini del mondo, non avendo operato nell' arte come si conveniva.' ['He having raised himself out of reverence so as to sit on the bed, and giving an account of his illness and its circumstances, yet showed how much he had offended God and mankind in not having worked at his art as he should have done.'] Vasari [ed. Poggi, 1919, 43].

listen to these with great pleasure and without the din of hammers and other noises.'[1]

It is indeed quite possible that the idea of a radiantly happy and pleasure-loving Leonardo is only applicable to the first and longer period of the artist's life. Afterwards, when the downfall of Lodovico Moro's rule forced him to leave Milan, the city that was the centre of his activity and where his position was assured, and to pursue a life lacking in security and not rich in external successes, until he found his last asylum in France, the sparkle of his temperament may have grown dim and some strange sides of his nature may have been thrown into prominence. Moreover, the turning of his interests from his art to science, which increased as time went on, must have played its part in widening the gulf between himself and his contemporaries. All the efforts in which in their opinion he frittered away his time when he could have been industriously painting to order and becoming rich (as, for example, his former fellow student Perugino did) seemed to them to be merely capricious trifling or even caused him to be suspected of being in the service of the 'black art'. We are in a position to understand him better, for we know from his notes what were the arts that he practised. In an age which was beginning to replace the authority of the Church with that of antiquity and which was not yet familiar with any form of research not based on presuppositions, Leonardo – the forerunner and by no means unworthy rival of Bacon and Copernicus – was necessarily isolated. In his dissection of the dead bodies of horses and human beings, in his construction of flying machines, and in his studies on the nutrition of plants and their [66]
reactions to poisons, he certainly departed widely from the commentators on Aristotle, and came close to the despised alchemists, in whose laboratories experimental research had found some refuge at least in those unfavourable times.

The effect that this had on his painting was that he took up his brush with reluctance, painted less and less, left what he had begun for the most part unfinished and cared little about the ultimate fate of his works. And this was what he was blamed for by his contemporaries: to them his attitude towards his art remained a riddle.

Several of Leonardo's later admirers have made attempts to acquit his character of the flaw of instability. In his defence they claim that he is blamed for what is a general feature of great artists: even the energetic Michelangelo, a man entirely given up to his labours, left many of his works incomplete, and it was no more his fault than it was Leonardo's

1 *Trattato della Pittura* [Ludwig (1909, 36); also I. A. Richter (1952, 330 f.)].

in the parallel instance. Moreover, in the case of some of the pictures, they urge, it is not so much a question of their being unfinished as of his declaring them to be so. What appears to the layman as a masterpiece is never for the creator of the work of art more than an unsatisfactory embodiment of what he intended; he has some dim notion of a perfection, whose likeness time and again he despairs of reproducing. Least of all, they claim, is it right to make the artist responsible for the ultimate fate of his works.

Valid as some of these excuses may be, they still do not cover the whole state of affairs that confronts us in Leonardo. The same distressing struggle with a work, the final flight from it and the indifference to its future fate may recur in many other artists, but there is no doubt that this behaviour is shown in Leonardo in an extreme degree. Solmi (1910, 12) quotes the remark of one of his pupils: 'Pareva che ad ogni ora tremasse, quando si poneva a dipingere, e però non diede mai fine ad alcuna cosa cominciata, considerando la grandezza dell'arte, tal che egli scorgeva errori in quelle cose, che ad altri parevano miracoli.'[1] His last pictures,
[67] he goes on, the Leda, the Madonna di Sant' Onofrio, Bacchus and the young St John the Baptist, remained unfinished 'come quasi intervenne di tutte le cose sue . . .'[2] Lomazzo, who made a copy of the Last Supper, refers in a sonnet to Leonardo's notorious inability to finish his works:

> Protogen che il pennel di sue pitture
> Non levava, agguaglio il Vinci Divo
> Di cui opra non è finita pure.[3]

The slowness with which Leonardo worked was proverbial. He painted at the Last Supper in the Convent of Santa Maria delle Grazie in Milan, after the most thorough preparatory studies, for three whole years. One of his contemporaries, Matteo Bandelli, the story-writer, who at the time was a young monk in the convent, tells how Leonardo often used to climb up the scaffolding early in the morning and remain there till twilight never once laying his brush aside, and with no thought of eating or drinking. Then days would pass without his putting his hand to it. Sometimes he would remain for hours in front of the painting,

1 ['He appeared to tremble the whole time when he set himself to paint, and yet he never completed any work he had begun, having so high a regard for the greatness of art that he discovered faults in things that to others seemed miracles.']

2 ['As happened more or less to all his works.']

3 ['Protogenes, who never lifted his brush from his work, was the equal of the divine Vinci, who never finished anything at all.'] Quoted by Scognamiglio (1900, [112]).

merely examining it in his mind. At other times he would come straight to the convent from the court in the castle at Milan, where he was making the model of the equestrian statue for Francesco Sforza, in order to add a few strokes of the brush to a figure, and then immediately break off.[1] According to Vasari he spent four years in painting the portrait of Mona Lisa, the wife of the Florentine Francesco del Giocondo, without being able to bring it to final completion. This circumstance may also account for the fact that the picture was never delivered to the man who commissioned it, but instead remained with Leonardo and was taken to France by him.[2] It was bought by King Francis I, and today forms one of the greatest treasures of the Louvre.

If these reports of the way in which Leonardo worked are compared with the evidence of the extraordinarily numerous sketches and studies which he left behind him and which exhibit every motif appearing in his paintings in a great variety of forms, we are bound totally to reject the [68]
idea [*Auffassung*]^{T} that traits of hastiness and unsteadiness acquired the slightest influence over Leonardo's relation to his art. On the contrary, it is possible to observe a quite extraordinary profundity, a wealth of possibilities between which a decision can only be reached with hesitation, demands which can hardly be satisfied, and an inhibition [*Hemmung*]^{T} in the actual execution which is not, in fact, to be explained even by the artist inevitably falling short of his ideal. The slowness which had all along been conspicuous in Leonardo's work is seen to be a symptom of this inhibition and to be the forerunner of his subsequent withdrawal from painting.[3] It was this too which determined the fate of the Last Supper – a fate that was not undeserved. Leonardo could not become reconciled to fresco painting, which demands rapid work while the ground is still moist, and this was the reason why he chose oil colours, the drying of which permitted him to protract the completion of the painting to suit his mood and leisure. These pigments, however, detached themselves from the ground on which they were applied and which separated them from the wall. Added to this, the defects in the wall, and the later fortunes of the building itself, determined what seems to be the inevitable ruin of the picture.[4]

The miscarriage of a similar technical experiment appears to have

1 Von Seidlitz (1909, **1**, 203).

2 Von Seidlitz (1909, **2**, 48).

3 Pater [1873, 100]: 'But it is certain that at one period of his life he had almost ceased to be an artist.'

4 See von Seidlitz (1909, **1**, [250 ff.]) for the history of the attempts to restore and preserve the picture.

caused the destruction of the Battle of Anghiari, the painting which, in competition with Michelangelo, he began to paint some time afterwards on a wall of the Sala del Consiglio in Florence, and which he also abandoned in an unfinished condition. Here it seems as if an alien interest – in experimentation – at first reinforced the artistic one, only to damage the work later on.

The character of Leonardo the man showed some other unusual traits and apparent contradictions. A certain inactivity and indifference seemed obvious in him. At a time when everyone was trying to gain the widest scope for his activity – a goal unattainable without the development of energetic aggressiveness towards other people – Leonardo was
[69] notable for his quiet peaceableness and his avoidance of all antagonism and controversy. He was gentle and kindly to everyone; he declined, it is said, to eat meat, since he did not think it justifiable to deprive animals of their lives; and he took particular pleasure in buying birds in the market and setting them free.[1] He condemned war and bloodshed and described man as not so much the king of the animal world but rather the worst of the wild beasts.[2] But this feminine delicacy of feeling did not deter him from accompanying condemned criminals on their way to execution in order to study their features distorted by fear and to sketch them in his notebook. Nor did it stop him from devising the cruellest offensive weapons and from entering the service of Cesare Borgia as chief military engineer. He often gave the appearance of being indifferent to good and evil, or he insisted on measurement by a special standard. He accompanied Cesare in a position of authority during the campaign that brought the Romagna into the possession of that most ruthless and faithless of adversaries. There is not a line in Leonardo's notebooks which reveals any criticism of the events of those days, or any concern in them. A comparison suggests itself here with Goethe during the French campaign.

If a biographical study is really intended to arrive at an understanding of its hero's mental life it must not – as happens in the majority of biographies as a result of discretion or prudishness – silently pass over its subject's sexual activity or sexual individuality. What is known of Leonardo in this respect is little: but that little is full of significance. In an age which saw a struggle between sensuality without restraint and gloomy asceticism, Leonardo represented the cool repudiation of

1 Müntz (1899, 18). A letter of a contemporary from India to one of the Medici alludes to this characteristic behaviour of Leonardo. (See J. P. Richter [1883, **2**, 103–4 *n.*].)

2 Bottazzi (1910, 186).

sexuality – a thing that would scarcely be expected of an artist and a portrayer of feminine beauty. Solmi quotes the following sentence of his which is evidence of his frigidity: 'The act of procreation and everything connected with it is so disgusting that mankind would soon die out if it were not an old-established custom and if there were not pretty faces and sensuous natures.'[1] His posthumous writings, which not only deal with the greatest scientific problems but also contain trivialities that strike us as scarcely worthy of so great a mind (an allegorical natural history, animal fables, jokes, prophecies),[2] are chaste – one might say even abstinent – to a degree that would cause surprise in a work of *belles lettres* even today. So resolutely do they shun everything sexual that it would seem as if Eros alone, the preserver of all living things, was not worthy material for the investigator in his pursuit of knowledge.[3] It is well known how frequently great artists take pleasure in giving vent to their phantasies in erotic and even crudely obscene pictures. In Leonardo's case on the contrary we have only some anatomical sketches of the internal female genitals, the position of the embryo in the womb and so on.[4] [70]

1 Solmi (1908, [24]).

2 Herzfeld (1906).

3 An exception to this (though an unimportant one) is perhaps to be found in his collected witticisms – *belle facezie* – which have not been translated. See Herzfeld (1906, 151). – [This reference to Eros as 'the preserver of all living things' seems to anticipate Freud's introduction of the name ten years later, in almost exactly the same phrase, as a general term for the sexual as opposed to the death drives. See, for instance, *Beyond the Pleasure Principle* (1920*g*), *RSE*, **18**, 49 and 50.]

4 [*Footnote added* 1919:] Some remarkable errors are visible in a drawing made by Leonardo of the sexual act seen in anatomical sagittal section, which certainly cannot be called obscene [Fig. 1]. They were discovered by Reitler (1917) and discussed by him in the light of the account which I have given here of Leonardo's character:

'It is precisely in the process of portraying the act of procreation that this excessive drive to research has totally failed – obviously only as a result of his even greater sexual repression. The man's body is drawn in full, the woman's only in part. If the drawing reproduced in Fig. 1 is shown to an unprejudiced onlooker with the head visible but all the lower parts covered up, it may be safely assumed that the head will be taken to be a woman's. The wavy locks on the forehead, and the others, which flow down the back approximately to the fourth or fifth dorsal vertebra, mark the head as more of a woman's than a man's.

'The woman's breast reveals two defects. The first indeed is an artistic one, for its outline gives it the appearance of a breast that is flabby and hangs down unpleasingly. The second defect is anatomical, for Leonardo the researcher had obviously been prevented by his fending off of sexuality from ever making a close examination of a nursing woman's nipples. Had he done so he would have been bound to notice that the milk flows out of a number of separate excretory ducts. Leonardo, however, drew only a single duct extending far down into the abdominal cavity and probably in his view drawing the milk from the *cisterna chyli* and perhaps also connected in some way with the sex organs. It must, of course, be taken into consideration that the study of the internal organs of the human body was at that time made extremely difficult, since the dissection of bodies was regarded as desecration of the dead and was most severely punished. Whether Leonardo, who had certainly only very little material for dissection at his disposal, knew anything

[71] It is doubtful whether Leonardo ever embraced a woman in passion; nor is it known that he had any intimate mental relationship with a

at all of the existence of a lymph reservoir in the abdominal cavity is therefore in fact highly questionable, although in his drawing he included a cavity that is no doubt intended to be something of the sort. But from his making the lactiferous duct extend still further downwards till it reaches the internal sex organs we may suspect that he was trying to represent the synchronization of the beginning of the secretion of milk and the end of pregnancy by means of visible anatomical connections as well. However, even if we are ready to excuse the artist's defective knowledge of anatomy by referring it to the circumstances of his time, the striking fact still remains that it is precisely the female genital that Leonardo has treated so carelessly. The vagina and something that looks like the *portio uteri* can no doubt be made out, but the lines indicating the uterus itself are completely confused.

'The male genital, on the other hand, is depicted by Leonardo much more correctly. Thus, for instance, he was not satisfied with drawing the testis but also put in the epididymis, which he drew with perfect accuracy.

'What is especially remarkable is the posture in which Leonardo makes coitus take place. Pictures and drawings by famous artists exist which depict *coitus a tergo*, *a latere*, etc., but when it comes to a drawing of the sexual act being performed standing up, we must surely suppose that there was a sexual repression of quite special strength to have caused it to be represented in this isolated and almost grotesque way. If one wants to enjoy oneself it is usual to make oneself as comfortable as possible: this of course is true for both the primal drives, hunger and love. Most of the peoples of antiquity took their meals in a lying position and it is normal in coitus today to lie down just as comfortably as did our ancestors. Lying down implies more or less a wish to stay in the desired situation for some time.

'Moreover, the features of the man with the feminine head are marked by a resistance that is positively indignant. His brows are wrinkled and his gaze is directed sideways with an expression of repugnance. The lips are pressed together and their corners are then drawn down. In this face can be seen neither the pleasure of love's blessings nor the happiness of indulgence: it expresses only indignation and aversion.

'The clumsiest blunder, however, was made by Leonardo in drawing the two lower extremities. The man's foot should in point of fact have been his right one; for since Leonardo depicted the act of union in an anatomical sagittal section it follows of course that the man's left foot would be above the plane of the picture. Conversely, and for the same reason, the woman's foot should have belonged to her left side. But, in fact, Leonardo has interchanged male and female. The male figure has a left foot and the female one a right foot. This interchange is easiest to grasp if one recalls that the big toes lie on the inner sides of the feet.

Fig. 1

'This anatomical drawing alone would have made it possible to deduce the repression of libido – a repression which threw the great artist and investigator into something approaching confusion.'

woman, such as Michelangelo's with Vittoria Colonna. While he was still an apprentice, living in the house of his master Verrocchio, a charge of forbidden homosexual practices was brought against him, along with some other young people, which ended in his acquittal. He seems to [72] have fallen under this suspicion because he had employed a boy of bad reputation as a model.[1] When he had become a Master, he surrounded himself with handsome boys and youths whom he took as pupils. The [73] last of these pupils, Francesco Melzi, accompanied him to France, remained with him up to his death and was named by him as his heir. Without sharing in the certainty of his modern biographers, who naturally reject the possibility that there was a sexual relationship between him and his pupils as a baseless insult to the great man, we may take it as much more probable that Leonardo's affectionate relations with the young men who – as was the custom with pupils at that time – shared his existence did not extend to sexual activity. Moreover, a high degree of sexual activity is not to be attributed to him.

There is only one way in which the peculiarity of this emotional and sexual life [*Geschlechtslebens*][T] can be understood in connection with *Geschlecht* Leonardo's double nature as an artist and as a scientific investigator. Among his biographers, to whom a psychological approach is often very alien, there is to my knowledge only one, Edmondo Solmi, who has approached the solution to the problem; but a writer who has chosen Leonardo as the hero of a great historical novel, Dmitry Sergeyevich Merezhkovsky, has made a similar reading of this unusual man the basis of his portrait and has given clear expression to his conception [*Auffassung*], not indeed in plain language, but (after the way of writers of imagination) in plastic terms.[2] Solmi's verdict on Leonardo is as follows

[*Added* 1923:] These remarks of Reitler's have been criticized, it is true, on the ground that such serious conclusions should not be drawn from a hasty sketch, and that it is not even certain whether the different parts of the drawing really belong together. [The anatomical drawing discussed here by Reitler, and assumed by him (and consequently by Freud) to be Leonardo's original, is, in fact, as has since been pointed out by Brian Farrell, a reproduction of a lithograph by Wehrt which was published in 1830 and had been made by copying an engraving by Bartolozzi, itself published in 1812. Bartolozzi put in the feet, which Leonardo himself had not drawn, and Wehrt added the sour expression on the man's face. Leonardo's original drawing, which is at Windsor Castle, *Quaderni d'Anatomia*, III folio, 3 v., shows the man's head with a calm, neutral expression.]

1 According to Scognamiglio (1900, 49) there is a reference to this episode in an obscure and even variously read passage in the Codex Atlanticus: 'Quando io feci Domeneddio putto voi mi metteste in prigione, ora s'io lo fo grande, voi mi farete peggio.' ['When I represented the Lord God as a baby, you put me in prison; now if I represent him as an adult you will do worse to me.']

2 Merezhkovsky (1902; German trans., 1903). *Leonardo da Vinci* forms the second work of a great historical trilogy entitled *Christ and Antichrist*. The two other volumes are *Julian the Apostate* and *Peter and Alexis*.

(1908, 46): 'But his insatiable desire to understand everything around him, and to fathom in a spirit of cold superiority the deepest secret of all that is perfect, had condemned Leonardo's work to remain for ever unfinished.'

In an essay in the *Conferenze Fiorentine* the following pronouncement of Leonardo's is quoted, which represents his confession of faith and provides the key to his nature: 'Nessuna cosa si può amare nè odiare, se prima non si ha cognition di quella.'[1] That is to say: One has no right to love or hate anything if one has not acquired a thorough knowledge of its nature. And the same is repeated by Leonardo in a passage in the treatise on painting where he seems to be defending himself against the
[74] charge of irreligion: 'But such carping critics would do better to keep silent. For that (line of conduct) is the way to become acquainted with the Creator of so many wonderful things, and this is the way to love so great an Inventor. For in truth great love springs from great knowledge of the beloved object, and if you know it but little you will be able to love it only a little or not at all . . .'[2]

The value of these remarks of Leonardo's is not to be looked for in their conveying an important psychological fact; for what they assert is obviously false, and Leonardo must have known this as well as we do. It is not true that human beings delay loving or hating until they have studied and become familiar with the nature of the object to which these affects apply. On the contrary they love impulsively, from emotional motives which have nothing to do with knowledge, and whose operation is at most weakened by reflection and consideration. Leonardo, then, could only have meant that the love practised by human beings was not of the proper and unobjectionable kind: one *should* love in such a way as to hold back the affect, subject it to the process of reflection and let it take its course only when it has stood up to the test of thought. And at the same time we understand that he wishes to tell us that it happens so in his case and that it would be worthwhile for everyone else to treat love and hatred as he does.

And in his case it really seems to have been so. His affects were con-
Trieb trolled and subjected to the drive to research [*Forschertrieb*][T]; he did not love and hate, but asked himself about the origin and significance of what he was to love or hate. Thus he was bound at first to appear indifferent to good and evil, beauty and ugliness. During this work of investigation love and hate threw off their positive or negative signs and

1 Bottazzi (1910, 193) [J. P. Richter (1883, **2**, 244)].

2 *Trattato della Pittura* [Ludwig (1909, 54)].

were both alike transformed into intellectual interest. In reality Leonardo was not devoid of passion; he did not lack the divine spark which is directly or indirectly the driving force [*Triebkraft*] – *il primo motore* – behind all human activity. He had merely converted his passion into a thirst for knowledge; he then applied himself to investigation with the persistence, constancy and penetration which is derived from passion, and at the climax of intellectual labour, when knowledge had been won, he allowed the long-restrained affect to break loose and to flow away freely, as a stream of water drawn from a river is allowed to flow [75]
away when its work is done. When, at the climax of a discovery, he could survey a large portion of the whole nexus, he was overcome by emotion, and in ecstatic language praised the splendour of the part of creation that he had studied, or – in religious phraseology – the greatness of his Creator. This process of transformation in Leonardo has been rightly understood by Solmi. After quoting a passage of this sort in which Leonardo celebrates the sublime law [*Zwang*][T] of nature ('O mirabile necessità . . .'), he writes (1910, 11): 'Tale trasfigurazione della scienza della natura in emozione, quasi direi, religiosa, è uno dei tratti caratteristici de' manoscritti vinciani, e si trova cento e cento volte espressa . . .'[1]

Because of his insatiable and indefatigable thirst for knowledge Leonardo has been called the Italian Faust. But quite apart from doubts about a possible transformation of the drive to investigate [*Forschertriebs*] back into an enjoyment of life – a transformation which we must take as fundamental in the tragedy of Faust – the view may be hazarded that Leonardo's development approaches Spinoza's mode of thinking.

A conversion of psychical drive force [*Triebkraft*] into various forms of activity can perhaps no more be achieved without loss than a conversion of physical forces. The example of Leonardo teaches us how many other things we have to take into account in connection with these processes. The postponement of loving until full knowledge is acquired ends in a substitution of the latter for the former. A man who has won his way to a state of knowledge cannot properly be said to love and hate; he remains beyond love and hatred. He has investigated instead of loving. And that is perhaps why Leonardo's life was so much poorer in love than that of other great men, and of other artists. The stormy passions of a nature that inspires and consumes, passions in which other men have enjoyed their richest experience, appear not to have touched him.

1 ['Such a transfiguration of natural science into a sort of religious emotion is one of the characteristic features of Leonardo's manuscripts, and there are hundreds and hundreds of examples of it.']

There are some further consequences. Investigating has taken the place of acting and creating as well. A man who has begun to have an inkling of the grandeur of the universe with all its complexities and its
[76] laws readily forgets his own insignificant self. Lost in admiration and filled with true humility, he all too easily forgets that he himself is a part of those active forces and that in accordance with the scale of his personal strength the way is open for him to try to alter a small portion of the destined course of the world – a world in which the small is still no less wonderful and significant than the great.

Leonardo's researches had perhaps first begun, as Solmi believes, in the service of his art;[1] he directed his efforts to the properties and laws of light, colours, shadows and perspective in order to ensure mastery in the imitation of nature and to point the same way to others. It is probable that at that time he already overrated the value to the artist of these branches of knowledge. Still constantly following the lead given by the requirements of his painting he was then driven to investigate the painter's subjects, animals and plants, and the proportions of the human body, and, passing from their exterior, to proceed to gain a knowledge of
Aufbau their internal structure [*Baues*]^{T} and their vital functions, which indeed also find expression in their appearance and have a claim to be depicted in art. And finally the drive, which had become overwhelming, swept him away until the connection with the demands of his art was severed, so that he discovered the general laws of mechanics and divined the history of the stratification and fossilization in the Arno valley, and until he could enter in large letters in his book the discovery: *II sole non si move*.[2] His investigations extended to practically every branch of natural science, and in every single one he was a discoverer or at least a prophet and pioneer.[3] Yet his urge for knowledge was always directed to the external world; something kept him far away from the investigation of
Seele [77] the human mind [*Seelenlebens*]^{T}. In the 'Academia Vinciana' [p. 116 below], for which he drew some cleverly intertwined emblems, there was little room for psychology.

Then, when he made the attempt to return from investigation to his starting point, the exercise of his art, he found himself disturbed by the new direction of his interests and the changed nature of his mental

1 Solmi (1910, 8): 'Leonardo aveva posto, come regola al pittore, lo studio della natura . . . poi la passione dello studio era divenuta dominante, egli aveva voluto acquistare non più la scienza per l'arte, ma la scienza per la scienza.' ['Leonardo had prescribed the study of nature as a rule for the painter . . . , then the passion for study had become dominant, he had no longer wished to acquire learning for the sake of art, but learning for the sake of learning.']

2 ['The sun does not move.' *Quaderni d'Anatomia*, 1–6, Royal Library, Windsor, V, 25.]

3 See the enumeration of his scientific achievements in the fine biographical introduction by Marie Herzfeld (1906), in the various essays of the *Conferenze Fiorentine* (1910), and elsewhere.

activity. What interested him in a picture was above all a problem; and behind the first one he saw countless other problems arising, just as he used to in his endless and inexhaustible investigation of nature. He was no longer able to limit his demands, to see the work of art in isolation and to tear it from the wide context to which he knew it belonged. After the most exhausting efforts to bring to expression in it everything which was connected with it in his thoughts, he was forced to abandon it in an unfinished state or to declare that it was incomplete.

The artist had once taken the investigator into his service to assist him; now the servant had become the stronger and suppressed his master.

When we find that in the picture presented by a person's character a single drive has developed an excessive strength, as did the craving for knowledge in Leonardo, we look for the explanation in a special disposition – though about its determinants (which are probably organic) scarcely anything is yet known. Our psychoanalytic studies of neurotic people have, however, led us to form two further expectations which it would be gratifying to find confirmed in each particular case. We consider it probable that a drive like this of excessive strength was already active in the subject's earliest childhood, and that its supremacy was established by impressions in the child's life. We make the further assumption that it found reinforcement from what were originally sexual drive forces, so that later it could take the place of a part of the subject's sexual life [*Sexuallebens*]. Thus a person of this sort would, for example, pursue research with the same passionate devotion that another would give to his love, and he would be able to investigate instead of loving. We would venture to infer that it is not only in the example of the drive to investigate that there has been a sexual reinforcement, but also in most other cases where a drive is of special intensity.

Observation of men's daily lives shows us that most people succeed in [78]
directing very considerable portions of their sexual drive forces to their professional activity. The sexual drive is particularly well fitted to make contributions of this kind since it is endowed with a capacity for sublimation: that is, it has the power to replace its immediate aim with other aims which may be valued more highly and which are not sexual. We accept this process as proved whenever the history of a person's childhood – that is, the history of his mental development – shows that in childhood this over-powerful drive was in the service of sexual interests. We find further confirmation if a striking atrophy occurs in the sexual life of maturity, as though a portion of sexual activity had now been replaced by the activity of the over-powerful drive.

There seem to be special difficulties in applying these expectations to the case of an over-powerful drive to investigation, since precisely in the case of children there is a reluctance to credit them with either this serious drive or any noteworthy sexual interests. However, these difficulties are easily overcome. The curiosity of small children is manifested in their untiring love of asking questions; this is bewildering to the adult so long as he fails to understand that all these questions are merely circumlocutions and that they cannot come to an end because the child is only trying to make them take the place of a question which he does *not* ask. When he grows bigger and becomes better informed this expression of curiosity often comes to a sudden end. Psychoanalytic investigation provides us with a full explanation by teaching us that many, perhaps most children, or at least the most gifted ones, pass through a period, beginning when they are about three, which may be called the period of *infantile sexual researches*. So far as we know, the curiosity of children of this age does not awaken spontaneously, but is aroused by the impression made by some important event – by the actual birth of a little brother or sister, or by a fear of it based on external experiences – in which the child perceives a threat to his selfish [*egoistischen*] interests. Researches are directed to the question of where babies come from, exactly as if the child were looking for ways and means to avert so undesired an event. In this way we have been astonished to learn that children refuse to believe the bits of information that are given them – for example that they energetically reject the fable of the stork with its wealth of mythological [79] meaning – that they date their intellectual independence from this act of disbelief, and that they often feel in serious opposition to adults and in fact never afterwards forgive them for having deceived them here about the true facts of the case. They investigate along their own lines, divine the baby's presence inside its mother's body, and following the lead of the impulses of their own sexuality form theories of babies originating from eating, of their being born through the bowels, and of the obscure part played by the father. By that time they already have a notion of the sexual act, which appears to them to be something hostile and violent. But since their own sexual constitution has not yet reached the point of being able to produce babies, their investigation of where babies come from must inevitably come to nothing too and be abandoned as insoluble. The impression caused by this failure in the first attempt at intellectual independence appears to be of a lasting and deeply depressing kind.[1]

1 These improbable-sounding assertions can be confirmed from a study of my 'Analysis of a Phobia in a Five-Year-Old Boy' (1909*b*), *RSE*, **10**, 5 ff., and of similar observations. [Before 1924 these last words ran: 'and of the similar observation in Volume II of the *Jahrbuch für*

When the period of infantile sexual researches has been terminated by a wave of energetic sexual repression, the drive to research has three distinct possible vicissitudes [*Schicksal*][T] open to it owing to its early connection with sexual interests. In the first of these, research shares the fate of sexuality; thenceforward curiosity remains inhibited and the free activity of intelligence may be limited for the whole of the subject's lifetime, especially as shortly after this the powerful religious inhibition of thought is brought into play by education [*Erziehung*][T]. This is the type characterized by neurotic inhibition. We know very well that the intellectual weakness which has been acquired in this way gives an effective impetus to the outbreak of a neurotic illness. In a second type the intellectual development is sufficiently strong to resist the sexual repression [*Sexualverdrängung*][T] which has hold of it. Some time after the infantile sexual researches have come to an end, the intelligence, having grown stronger, recalls the old association and offers its help in evading sexual repression, and the suppressed sexual activities of research return from the unconscious in the form of compulsive brooding [*Grübelzwang*], naturally in a distorted and unfree form, but sufficiently powerful to sexualize thinking itself and to colour intellectual operations with the pleasure and anxiety [*Lust und Angst*][T] that belong to sexual processes proper. Here investigation becomes a sexual activity, often the exclusive one, and the feeling that comes from settling things in one's mind and explaining them replaces sexual satisfaction; but the interminable character of the child's researches is also repeated in the fact that this brooding never ends and that the intellectual feeling, so much desired, of having found a solution recedes more and more into the distance.

Verdrängung
[80]

By virtue of a special disposition, the third type, which is the rarest and most perfect, escapes both inhibition of thought and neurotic compulsive thinking. It is true that here too sexual repression comes about, but it does not succeed in relegating a component drive of sexual desire [*Sexuallust*] to the unconscious. Instead, the libido evades the fate of repression by being sublimated from the very beginning into curiosity and by becoming attached to the powerful drive to research as a reinforcement. Here, too, the research becomes to some extent compulsive and a substitute for sexual activity; but owing to the complete difference in the underlying psychical processes (sublimation instead of an irruption from the unconscious) the quality of neurosis is absent; there is no

psychoanalytische und psychopathologische Forschungen' – a reference to Jung (1910*c*).] In a paper on 'The Sexual Theories of Children' (1908*c*) I wrote: 'This brooding and doubting, however, becomes the prototype of all later intellectual work directed towards the solution to problems, and the first failure has a crippling effect on the child's whole future.' [Cf. *RSE*, **9**, 190.]

attachment to the original complexes of infantile sexual research, and the drive can operate freely in the service of intellectual interest. Sexual repression, which has made the drive so strong through the addition to it of sublimated libido, is still taken into account by the drive, in that it avoids any concern with sexual themes.

If we reflect on the concurrence in Leonardo of his over-powerful drive to research and the atrophy of his sexual life (which was restricted to what is called ideal [sublimated] homosexuality) we shall be disposed to claim him as a model instance of our third type. The core of his nature, and the secret of it, would appear to be that after his curiosity had been activated in infancy in the service of sexual interests he succeeded in
[81] sublimating the greater part of his libido into an urge for research. But it is not easy, to be sure, to prove that this view is right. To do so we should need some picture of his mental development in the first years of his childhood, and it seems foolish to hope for material of that sort when the accounts of his life are so meagre and so unreliable, and when moreover it is a question of information about circumstances that escape the attention of observers even in relation to people of our own generation.

About Leonardo's youth we know very little. He was born in 1452 in the little town of Vinci between Florence and Empoli; he was an illegitimate child, which in those days was certainly not considered a grave social stigma; his father was Ser Piero da Vinci, a notary and descended from a family of notaries and farmers who took their name from the locality of Vinci; his mother was a certain Caterina, probably a peasant girl, who later married another native of Vinci. This mother does not occur again in the history of Leonardo's life, and it is only Merezhkovsky – the novelist – who believes that he has succeeded in finding some trace of her. The only definite piece of information about Leonardo's childhood comes in an official document of the year 1457; it is a Florentine land register for the purpose of taxation, which mentions Leonardo among the members of the household of the Vinci family as the five-year-old illegitimate child of Ser Piero.[1] The marriage of Ser Piero with a certain Donna Albiera remained childless, and it was therefore possible for the young Leonardo to be brought up in his father's house. He did not leave this house till – at what age is not known – he entered Andrea del Verrocchio's studio as an apprentice. In the year 1472 Leonardo's name was already to be found in the list of members of the '*Compagnia dei Pittori*'. That is all.

1 Scognamiglio (1900, 15).

II

There is, so far as I know, only one place in his scientific notebooks where Leonardo inserts a piece of information about his childhood. In a passage about the flight of vultures he suddenly interrupts himself to pursue a memory from very early years which had sprung to his mind: [82]

'It seems that I was always destined to be so deeply concerned with vultures; for I recall as one of my very earliest memories that while I was in my cradle a vulture came down to me, and opened my mouth with its tail, and struck me many times with its tail against my lips.'[1]

What we have here then is a childhood memory; and certainly one of the strangest sort. It is strange on account of its content and on account of the age to which it is assigned. That a person should be able to retain a memory of his suckling period is perhaps not impossible, but it cannot by any means be regarded as certain. What, however, this memory of Leonardo's asserts – namely that a vulture opened the child's mouth with its tail – sounds so improbable, so fabulous, that another view of it, which at a single stroke puts an end to both difficulties, has more to commend it to our judgement. On this view the scene with the vulture would not be a memory of Leonardo's but a phantasy [*Phantasie*][T], which he formed at a later date and transposed to his childhood.[2]

1 'Questo scriver si distintamente del nibio par che sia mio destino, perchè nella mia prima ricordatione della mia infantia e' mi parea che, essendo io in culla, che un nibio venissi a me e mi aprissi la bocca colla sua coda e molte volte mi percuotesse con tal coda dentro alle labbra.' (Codex Atlanticus, F.65 v., as given by Scognamiglio [1900, 22].) [In the German text Freud quotes Herzfeld's translation of the Italian original, and our version above is a rendering of the German. There are in fact two inaccuracies in the German: '*nibio*' should be 'kite' not 'vulture' (see Editors' Note, pp. 58–9 above), and '*dentro*', 'within', is omitted. This last omission is in fact rectified by Freud himself below (p. 80).]

2 [*Footnote added* 1919:] In a friendly notice of this book Havelock Ellis (1910*a*) has challenged the view put forward above. He objects that this memory of Leonardo's may very well have had a basis of reality, since children's memories often reach very much further back than is commonly supposed; the large bird in question need not of course have been a vulture. This is a point that I will gladly concede, and as a step towards lessening the difficulty I in turn will offer a suggestion – namely that his mother observed the large bird's visit to her child – an event which may easily have had the significance of an omen in her eyes – and repeatedly told him about it afterwards. As a result, I suggest, he retained the memory of his mother's story, and later, as so often happens, it became possible for him to take it for a memory of an experience of his own. However, this alteration does no damage to the force of my general account. It happens, indeed, as a general rule that the phantasies about their childhood which people construct at a late date are attached to trivial but real events of this early, and normally forgotten, period. There must thus have been some secret reason for bringing into prominence a real event of no importance and for elaborating it in the sort of way Leonardo did in his story of the bird, which he dubbed a vulture, and of its remarkable behaviour.

[83] This is often the way in which childhood memories originate. Quite unlike conscious memories from the time of maturity, they are not fixed at the moment of being experienced and afterwards repeated, but are elicited only at a later age when childhood is already past; in the process they are altered and falsified, and are put into the service of later trends, so that generally speaking they cannot be sharply distinguished from phantasies. Their nature is perhaps best illustrated by a comparison with the way in which the writing of history originated among the peoples of antiquity. As long as a nation was small and weak it gave no thought to the writing of its history. Men tilled the soil of their land, fought for their existence against their neighbours, and tried to gain territory from them and to acquire wealth. It was an age of heroes, not of historians. Then came another age, an age of reflection: men felt themselves to be rich and powerful, and now felt a need to learn where they had come from and how they had developed. Historical writing, which had begun to keep a continuous record of the present, now also cast a glance back to the past, gathered traditions and legends, interpreted the traces of antiquity that survived in customs and usages, and in this way created a history of the past. It was inevitable that this early history should have been an expression of present beliefs and wishes rather than a true picture of the past; for many things had been dropped from the nation's memory, while others were distorted, and some remains of the past were given a wrong interpretation in order to fit in with contemporary ideas. Moreover, people's motive [*Motiven*][T] for writing history was not objective curios-
[84] ity but a desire to influence their contemporaries, to encourage and inspire them, or to hold a mirror up before them. A man's conscious memory of the events of his maturity is in every way comparable to the first kind of historical writing [which was a chronicle of current events]; while the memories that he has of his childhood correspond, as far as their origins and reliability are concerned, to the history of a nation's earliest days, which was compiled later and for tendentious reasons.[1]

If, then, Leonardo's story about the vulture that visited him in his cradle is only a phantasy from a later period, one might suppose it could hardly be worthwhile spending much time on it. One might be satisfied with explaining it on the basis of his inclination, of which he makes no secret, to regard his preoccupation with the flight of birds as preordained by destiny. Yet in underrating this story one would be

1 [Chapter IV of *The Psychopathology of Everyday Life* (1901*b*) deals with childhood memories and screen memories, and, in an addition made to it in 1907, Freud makes the same comparison with historical writing. Cf. *RSE*, **6**, 42 and 235–6 *n*.]

committing just as great an injustice as if one were carelessly to reject the body of legends, traditions and interpretations found in a nation's early history. In spite of all the distortions and misunderstandings, they still represent the reality of the past: they are what a people forms out of the experience of its early days and under the dominance of motives that were once powerful and still operate today; and if it were only possible, by a knowledge of all the forces at work, to undo these distortions, there would be no difficulty in disclosing the historical truth lying behind the legendary material. The same holds good for the childhood memories or phantasies of an individual. What someone thinks he remembers from his childhood is not a matter of indifference; as a rule the residual memories – which he himself does not understand – cloak priceless pieces of evidence about the most important features in his mental development.[1]
As we now possess in the techniques of psychoanalysis excellent [85]
methods for helping us to bring this concealed material to light, we may venture to fill in the gap in Leonardo's life story by analysing his childhood phantasy. And if in doing so we remain dissatisfied with the degree of certainty which we achieve, we shall have to console ourselves with the reflection that so many other studies of this great and enigmatic man have met with no better fate [*Schicksal*].

If we examine with the eyes of a psychoanalyst Leonardo's phantasy of the vulture, it does not appear strange for long. We seem to recall

1 [*Footnote added* 1919:] Since I wrote the above words I have attempted to make similar use of an unintelligible memory dating from the childhood of another man of genius. In the account of his life that Goethe wrote when he was about sixty ('*Dichtung und Wahrheit*') there is a description in the first few pages of how, with the encouragement of his neighbours, he slung first some small and then some large pieces of crockery out of the window into the street, so that they were smashed to pieces. This is, indeed, the only scene that he reports from the earliest years of childhood. The sheer inconsequentiality of its content, the way in which it corresponded with the childhood memories of other human beings who did not become particularly great, and the absence in this passage of any mention of the young brother who was born when Goethe was three and three-quarters, and who died when he was nearly ten – all this induced me to undertake an analysis of this childhood memory. (This child is, in fact, mentioned at a later point in the book, where Goethe dwells on the many illnesses of childhood.) I hoped to be able as a result to replace it with something which would be more in keeping with the context of Goethe's account and whose content would make it worthy of preservation and of the place he has given it in the history of his life. The short analysis ['A Childhood Recollection from *Dichtung und Wahrheit*' (1917*b*), *RSE*, **17**, 139 ff.] made it possible for the throwing out of the crockery to be recognized as a magical act directed against a troublesome intruder; and at the place in the book where he describes the episode the intention is to triumph over the fact that a second son was not in the long run permitted to disturb Goethe's close relation with his mother. If the earliest memory of childhood, preserved in disguises such as these, should be concerned – in Goethe's case as well as in Leonardo's – with the mother, what would be so surprising in that? – [In the 1919 edition the phrase 'and the absence in this passage of any mention of the young brother . . .' ran '. . . and the remarkable absence of any mention whatever of a young brother . . .' It was given its present form, and the parenthesis that follows it was added, in 1923. The alteration is explained in a footnote added in 1924 to the Goethe paper (1917*b*), ibid., **17**, 143 *n*.]

having come across the same sort of thing in many places, for example in
Übersetzung dreams; so that we may venture to translate [*übersetzen*][T] the phantasy from its own special language into words that are generally understood. The translation is then seen to point to an erotic content. A tail, '*coda*', is one of the most familiar symbols and substitutive expressions for the male organ, in Italian no less than in other languages;[1] the situation in
[86] the phantasy, of a vulture opening the child's mouth and beating about inside it[2] vigorously with its tail, corresponds to the idea of an act of fellatio, a sexual act in which the penis is put into the mouth of the person involved. It is strange that this phantasy is so completely passive in character; moreover it resembles certain dreams and phantasies found in women or passive homosexuals (who play the part of the woman in sexual relations).

I hope the reader will restrain himself and not allow a surge of indignation to prevent his following psychoanalysis any further because it leads to an unpardonable aspersion on the memory of a great and pure man the very first time it is applied to his case. Such indignation, it is clear, will never be able to tell us the significance of Leonardo's childhood phantasy; at the same time Leonardo has acknowledged the phantasy in the most unambiguous fashion, and we cannot abandon our expectation – or, if it sounds better, our prejudice – that a phantasy of this kind must have *some* meaning, in the same way as any other psychical creation: a dream, a vision or a delirium. Let us rather therefore give a fair hearing for a while to the work of analysis, which indeed has not yet spoken its last word.

The inclination to take a man's sexual organ into the mouth and suck at it, which in respectable society is considered a loathsome sexual perversion, is nevertheless found with great frequency among women of today – and of earlier times as well, as ancient sculptures show – and in the state of being in love it appears completely to lose its repulsive character. Phantasies derived from this inclination are found by doctors even in women who have not become aware of the possibilities of obtaining sexual satisfaction in this way by reading Krafft-Ebing's *Psychopathia Sexualis* or from other sources of information. Women, it seems, find no

1 [Cf. the 'Original Record' of the case of the 'Rat Man', *RSE*, **10**, 234. – It may be pointed out (supposing the bird to have been in fact a kite) that the kite's long forked tail is one of its noticeable features and plays a large part in the virtuosity of its movements in the air and no doubt attracted Leonardo's attention in his observations of flight. The symbolic meaning of its *coda*, discussed by Freud in this passage, seems to be confirmed by a remark in an ornithological account of the kite published in *The Times* (July 7, 1956): 'At times the tail is fanned out at right angles to its normal plane.']

2 [See end of footnote 1, p. 77 above.]

difficulty in producing this kind of wishful phantasy spontaneously.[1] [87]
Further investigation informs us that this situation, which morality condemns with such severity, may be traced to an origin of the most innocent kind. It only repeats in a different form a situation in which we all once felt comfortable – when we were still in our suckling days ('*essendo io in culla*')[2] and took our mother's (or wet-nurse's) nipple into our mouth and sucked at it. The organic impression of this experience – the first source of pleasure in our life – doubtless remains indelibly printed on us; and when at a later date the child becomes familiar with the cow's udder whose function is that of a nipple, but whose shape and position under the belly make it resemble a penis, the preliminary stage has been reached which will later enable him to form the repellent sexual phantasy.[3]

Now we understand why Leonardo assigned the memory of his supposed experience with the vulture to his suckling period. What the phantasy conceals is merely a reminiscence of sucking – or being suckled – at his mother's breast, a scene of human beauty that he, like so many artists, undertook to depict with his brush, in the guise of the mother of God and her child. There is indeed another point which we do not yet understand and which we must not lose sight of: this reminiscence, which has the same importance for both sexes, has been transformed by the man Leonardo into a passive homosexual phantasy. For the time being we shall put aside the question of what there may be to connect homosexuality with sucking at the mother's breast, merely recalling that tradition does in fact represent Leonardo as a man with homosexual feelings. In this connection, it is irrelevant to our purpose whether or not the charge brought against the young Leonardo [p. 69 above] was justified. What decides whether we describe someone as an invert[4] is not his actual behaviour, but his emotional attitude.

Our interest is next claimed by another unintelligible feature of Leonardo's childhood phantasy. We interpret the phantasy as one of being suckled by his mother, and we find his mother replaced by – a [88]
vulture. Where does this vulture come from and how does it happen to be found in its present place?

At this point a thought [*Einfall*]^{T} comes to the mind from such a remote quarter that it would be tempting to set it aside. In the

1 On this point compare my 'Fragment of an Analysis of a Case of Hysteria' (1905*e*) [*RSE*, **7**, 46–7].

2 ['While I was in my cradle.' See footnote 1, p. 77 above.]

3 [Cf. the analysis of 'Little Hans', *RSE*, **10**, 6.]

4 [In 1910 only: 'a homosexual'.]

hieroglyphics of the ancient Egyptians the mother is represented by a picture of a vulture.[1] The Egyptians also worshipped a mother goddess, who was represented as having a vulture's head, or else several heads, of which at least one was a vulture's.[2] This goddess's name was pronounced *Mut*. Can the similarity to the sound of our word *Mutter* ['mother'] be merely a coincidence? There is, then, some real connection between vulture and mother – but what help is that to us? For have we any right to expect Leonardo to know of it, seeing that the first man who succeeded in reading hieroglyphics was François Champollion (1790–1832)?[3]

It would be interesting to enquire how it could be that the ancient Egyptians came to choose the vulture as a symbol of motherhood. Now the religion and civilization [*Kultur*][T] of the Egyptians were objects of scientific curiosity even to the Greeks and the Romans: and long before we ourselves were able to read the monuments of Egypt we had at our disposal certain pieces of information about them derived from the extant writings of classical antiquity. Some of these writings were by well-known authors, such as Strabo, Plutarch and Ammianus Marcellinus; while others bear unfamiliar names and are uncertain in their source of origin and their date of composition, like the *Hieroglyphica* of Horapollo Nilus and the book of oriental priestly wisdom which has come down to us under the name of the god Hermes Trismegistos. We learn from these sources that the vulture was regarded as a symbol of motherhood because only female vultures were believed to exist; there were, it was thought, no males of this species.[4] A counterpart to this restriction to one sex was also known to the natural
[89] history of antiquity: in the case of the scarabaeus beetle, which the Egyptians worshipped as divine, it was thought that only males existed.[5]

1 Horapollo (*Hieroglyphica* **1**, 11): '*Μητέρα δὲ γράφοντες . . . γῦπα ζωγραφοῦσιν.*' ['To denote a mother . . . they delineate a vulture.']

2 Roscher (1894–7), Lanzone (1882).

3 Hartleben (1906).

4 '*γῦπα δὲ ἄρρενα οὔ φασι γινέσθαι ποτε, ἀλλά θηλείας ἁπάσας.*' ['They say that no male vulture has ever existed but all are females.' Aelian, *De Natura Animalium*, II, 46.] Quoted by von Römer (1903, 732).

5 Plutarch: 'Veluti scarabaeos mares tantum esse putarunt Aegyptii sic inter vultures mares non inveniri statuerunt.' ['Just as they believed that only male scarabs existed, so the Egyptians concluded that no male vultures were to be found.' Freud has here inadvertently attributed to Plutarch a sentence which is, in fact, a gloss by Leemans (1835, 171) on Horapollo.]

How then were vultures supposed to be impregnated if all of them were female? This is a point fully explained in a passage in Horapollo.[1] At a certain time these birds pause in mid-flight, open their vagina and are impregnated by the wind.

We have now unexpectedly reached a position where we can take something as very probable which only a short time before we had to reject as absurd. It is quite possible that Leonardo was familiar with the scientific fable which was responsible for the vulture being used by the Egyptians as a pictorial representation of the idea of mother. He was a wide reader and his interest embraced all branches of literature and learning. In the Codex Atlanticus we find a catalogue of all the books he possessed at a particular date,[2] and in addition numerous jottings on other books that he had borrowed from friends; and if we may judge by the extracts from his notes by Richter [1883],[3] the extent of his reading can hardly be overestimated. Early works on natural history were well represented among them in addition to contemporary books; and all of them were already in print at the time. Milan was in fact the leading city in Italy for the new art of printing.

On proceeding further we come across a piece of information which can turn the probability that Leonardo knew the fable of the vulture into a certainty. The learned editor and commentator on Horapollo has the following note on the text already quoted above [Leemans, 1835, 172]: 'Caeterum hanc fabulam de vulturibus cupide amplexi sunt Patres [90]
Ecclesiastici, ut ita argumento ex rerum natura petito refutarent eos, qui Virginis partum negabant; itaque apud omnes fere hujus rei mentio occurrit.'[4]

So the fable of the single sex of vultures and their mode of conception remained something very far from an unimportant anecdote like the analogous tale of the scarabaeus beetle; it had been seized on by the Fathers of the Church so that they could have at their disposal a proof drawn from natural history to confront those who doubted sacred history. If vultures were described in the best accounts of antiquity as

1 *Horapollonis Niloi Hieroglyphica*, ed. Leemans (1835, 14). The words that refer to the vulture's sex run: '*μητέρα μέν, ἐπειδὴ ἄρρεν ἐν τούτω τῶ γένει τῶν ζώων οὐχ ὑπάρχει.*' ['(They use the picture of a vulture to denote) a mother, because in this race of creatures there are no males.' – It seems as though the wrong passage from Horapollo is quoted here. The phrase in the text implies that what we should have here is the myth of the vulture's impregnation by the wind.]

2 Müntz (1899, 282).

3 Müntz (ibid.).

4 ['But this story about the vulture was eagerly taken up by the Fathers of the Church, in order to refute, by means of a proof drawn from the natural order, those who denied the Virgin Birth. The subject is therefore mentioned in almost all of them.']

depending on the wind for impregnation, why could not the same thing have also happened on one occasion with a human female? Since the fable of the vulture could be turned to this account 'almost all' the Fathers of the Church made a practice of telling it, and thus it can hardly be doubted that Leonardo too came to know of it through its being favoured by so wide a patronage.

We can now reconstruct the origin of Leonardo's vulture phantasy. He once happened to read in one of the Fathers or in a book on natural history the statement that all vultures were females and could reproduce their kind without any assistance from a male: and at that point a memory sprang to his mind, which was transformed into the phantasy we have been discussing, but which meant to signify that he also had been such a vulture child – he had had a mother, but no father. With this memory was associated, in the only way in which impressions of so great an age can find expression, an echo of the pleasure he had had at his mother's breast. The allusion made by the Fathers of the Church to the idea of the Blessed Virgin and her child – an idea cherished by every artist – must have played its part in helping the phantasy to appear valuable and important to him. Indeed in this way he was able to identify himself with the child Christ, the comforter and saviour not of this one woman alone.

[91] Our aim in dissecting a childhood phantasy is to separate the real memory that it contains from the later motives that modify and distort it. In Leonardo's case we believe that we now know the real content of the phantasy: the replacement of his mother by the vulture indicates that the child was aware of his father's absence and found himself alone with his mother. The fact of Leonardo's illegitimate birth is in harmony with his vulture phantasy; it was only on this account that he could compare himself to a vulture child. But the next reliable fact that we possess about his youth is that by the time he was five he had been received into his father's household. We are completely ignorant when that happened – whether it was a few months after his birth or whether it was a few weeks before the drawing up of the land register [p. 76 above]. It is here that the interpretation of the vulture phantasy comes in: Leonardo, it seems to tell us, spent the critical first years of his life not by the side of his father and stepmother, but with his poor, forsaken, real mother, so that he had time to feel the absence of his father. This seems a slender and yet a somewhat daring conclusion to have emerged from our psychoanalytic efforts, but its significance will increase as we continue our investigation. Its certainty is reinforced when we consider the

circumstances that did in fact operate in Leonardo's childhood. In the same year that Leonardo was born, the sources tell us, his father, Ser Piero da Vinci, married Donna Albiera, a lady of good birth; it was to the childlessness of this marriage that the boy owed his reception into his father's (or rather his grandfather's) house – an event which had taken place by the time he was five years old, as the document attests. Now it is not usual at the start of a marriage to put an illegitimate offspring into the care of the young bride who still expects to be blessed with children of her own. Years of disappointment must surely first have elapsed before it was decided to adopt the illegitimate child – who had probably grown up an attractive young boy – as a compensation for the absence of the legitimate children that had been hoped for. It fits in best with the interpretation of the vulture phantasy if at least three years of Leonardo's life, and perhaps five, had elapsed before he could exchange the solitary person of his mother for a parental couple. And by then it was too late. In the first three or four years of life certain impressions become fixed and ways of reacting to the outside world are established [92] which can never be deprived of their importance by later experiences.

If it is true that the unintelligible memories of a person's childhood and the phantasies that are built on them invariably emphasize the most important elements in his mental development, then it follows that the fact which the vulture phantasy confirms, namely that Leonardo spent the first years of his life alone with his mother, will have been of decisive influence in the formation of his inner life. An inevitable effect of this state of affairs was that the child – who was confronted in his early life with one problem more than other children – began to brood on this riddle with special intensity, and so at a tender age became a researcher, tormented as he was by the great question of where babies come from and what the father has to do with their origin.[1] It was a vague suspicion that his researches and the history of his childhood were connected in this way which later prompted him to exclaim that he had been destined from the first to investigate the problem of the flight of birds since he had been visited by a vulture as he lay in his cradle. Later on it will not be difficult to show how his curiosity about the flight of birds was derived from the sexual researches of his childhood.

1 [Cf. 'The Sexual Theories of Children' (1908*c*), *RSE*, **9**, 183.]

III

[93] In Leonardo's childhood phantasy we have taken the element of the vulture to represent the real content of his memory, while the context in which Leonardo himself placed his phantasy has thrown a bright light on the importance which that content had for his later life. In proceeding with our work of interpretation we now come up against the strange problem of why this content has been recast into a homosexual situation. The mother who suckles her child – or to put it better, at whose breast the child sucks – has been turned into a vulture that puts its tail into the child's mouth. We have asserted [p. 80 above] that, according to the usual way in which language makes use of substitutes, the vulture's '*coda*' cannot possibly signify anything other than a male genital, a penis. But we do not understand how imaginative activity can have succeeded in endowing precisely this bird which is a mother with the distinguishing mark of masculinity; and in view of this absurdity we are at a loss how to reduce this creation of Leonardo's phantasy to any rational meaning.

However, we should not despair, as we reflect on the number of apparently absurd dreams that we have in the past compelled to give up their meaning. Is there any reason why a memory of childhood should offer us more difficulty than a dream?

Remembering that it is unsatisfactory when a peculiar feature is found singly, let us hasten to add another to it which is even more striking.[1]

The vulture-headed Egyptian goddess Mut, a figure without any personal character according to Drexler's article in Roscher's lexicon, was often merged with other mother goddesses of a more strongly marked individuality, like Isis and Hathor, but at the same time she maintained her separate existence and cult. A special feature of the Egyptian pantheon was that the individual gods did not disappear in the process of
[94] syncretization. Alongside the fusion of gods the individual divinities continued to exist in independence. Now this vulture-headed mother goddess was usually represented by the Egyptians with a phallus;[2] her body was female, as the breasts indicated, but it also had a male organ in a state of erection.

In the goddess Mut, then, we find the same combination of maternal and masculine characteristics as in Leonardo's phantasy of the vulture.

1 [Cf. some similar remarks by Freud in *The Interpretation of Dreams* (1900*a*), *RSE*, **4**, 120–1.]

2 See the illustrations in Lanzone (1882), Plates CXXXVI–CXXXVIII.

Are we to explain this coincidence by assuming that from studying his books [cf. p. 83 above] Leonardo had also learnt of the androgynous nature of the maternal vulture? Such a possibility is more than questionable; it appears that the sources to which he had access contained no information about this remarkable feature. It is more plausible to trace the correspondence back to a common factor operative in both cases but still unknown.

Mythology can teach us that an androgynous structure [*Bildung*][T], a combination of male and female sex characters, was an attribute not only of Mut but also of other deities like Isis and Hathor – though perhaps of these only insofar as they too had a maternal nature and became amalgamated with Mut (Römer, 1903). It teaches us further that other Egyptian deities, like Neith of Sais – from whom the Greek Athene was later derived – were originally conceived of as androgynous, i.e. as hermaphrodite, and that the same was true of many of the *Greek* gods, especially of those associated with Dionysus, but also of Aphrodite, who was later restricted to the role of a female goddess of love. Mythology may then offer the explanation that the addition of a phallus to the female body is intended to denote the primal creative force of nature, and that all these hermaphrodite divinities are expressions of the idea that only a combination of male and female elements can give a worthy representation of divine perfection. But none of these considerations gives us an explanation of the puzzling psychological fact that the human imagination does not boggle at endowing a figure which is intended to embody the essence of the mother with the mark of male potency [*Kraft*] which is the opposite of everything maternal.

Infantile sexual theories provide the explanation. There was once a [95]
time when the male genital was found compatible with the picture of the mother.[1] When a male child first turns his curiosity to the riddles of sexual life, he is dominated by his interest in his own genital. He finds that part of his body too valuable and too important for him to be able to believe that it could be missing in other people whom he feels he resembles so much. As he cannot guess that there exists another type of genital structure of equal worth, he is forced to make the assumption that all human beings, women as well as men, possess a penis like his own. This preconception is so firmly planted in the youthful investigator that it is not destroyed even when he first observes the genitals of little girls. His perception tells him, it is true, that there is something different from what there is in him, but he is incapable of admitting to himself that the

1 [Cf. 'The Sexual Theories of Children' (1908*c*), *RSE*, **9**, 183 ff.]

content of this perception is that he cannot find a penis in girls. That the penis could be missing strikes him as an uncanny and intolerable idea [*Vorstellung*][T], and so in an attempt at a compromise he comes to the conclusion that little girls have a penis as well, only it is still very small; it will grow later.[1] If it seems from later observations that this expectation is not realized, he has another remedy at his disposal: little girls too had a penis, but it was cut off and in its place was left a wound. This theoretical advance already makes use of personal experiences of a distressing kind: the boy in the meantime has heard the threat that the organ which is so dear to him will be taken away from him if he shows his interest in it too plainly. Under the influence of this threat of castration he now sees the notion he has gained of the female genitals in a new light; henceforth he will tremble for his masculinity, but at the same time he will despise the unhappy creatures on whom the cruel punishment has, as he supposes, already fallen.[2]

[96] Before the child comes under the dominance of the castration complex – at a time when he still holds women at full value – he begins to display an intense desire to look, as an erotic drive activity. He wants to see other people's genitals, at first in all probability to compare them with his own. The erotic attraction that comes from his mother soon culminates in a longing for her genital organ, which he takes to be a penis. With the discovery, which is not made till later, that women do not have a penis, this longing often turns into its opposite and gives place to a feeling of disgust which in the years of puberty can become the cause of psychical impotence, misogyny and permanent homosexuality. But the fixation on the object that was once strongly desired, the woman's penis, leaves indelible traces on the mental life of the child, who has pursued that portion of his infantile sexual researches with particular thoroughness. Fetishistic reverence for a woman's foot and shoe appears to take the foot merely as a substitutive symbol for the woman's penis which was

1 Compare the observations in the *Jahrbuch für psychoanalytische und psychopathologische Forschungen* [i.e. Freud, 1909*b* ('Little Hans'), *RSE*, **10**, 9–10, and Jung, 1910*c*. – *Added* 1919:], in the *Internationale Zeitschrift für ärztliche Psychoanalyse* and in [the section dealing with children in] *Imago*.

2 [*Footnote added* 1919:] The conclusion strikes me as inescapable that here we may also trace one of the roots of the anti-Semitism which appears with such elemental force and finds such irrational expression among the nations of the West. Circumcision is unconsciously equated with castration. If we venture to carry our conjectures back to the primaeval days of the human race we can surmise that originally circumcision must have been a milder substitute, designed to take the place of castration. [Further discussion on this can be found in a footnote to the analysis of 'Little Hans' (1909*b*), *RSE*, **10**, 28 *n.* 2, and in *Moses and Monotheism* (1939*a*), Essay III, Part I, Section D; ibid., **23**, 74 ff.]

once revered and later missed; without knowing it, '*coupeurs de nattes*'[1] play the part of people who carry out an act of castration on the female genital organ.

People will not reach a proper understanding of the activities of children's sexuality and will probably take refuge in declaring that what has been said here is incredible, so long as they cling to the attitude taken up by our civilization of depreciating the genitals and the sexual functions. To understand the mental life of children we require analogies from primitive times. Through a long series of generations the genitals have been for us the '*pudenda*', objects of shame, and even (as a result of further successful sexual repression) of disgust. If one makes a broad survey of the sexual life of our time and in particular of the classes who sustain human civilization, one is tempted to declare that[2] it is only with reluctance that the majority of those alive today obey the command to propagate their kind; they feel that their dignity as human beings [97]
suffers and is degraded in the process. What is to be found among us in the way of another view of sexual life is confined to the uncultivated lower strata of society; among the higher and more refined classes it is concealed, since it is considered culturally inferior, and it ventures to put itself into practice only in the face of a bad conscience. In the primaeval days of the human race it was a different story. The laborious compilations of the student of civilization provide convincing evidence that originally the genitals were the pride and hope of living beings; they were worshipped as gods and transmitted the divine nature of their functions to all newly learnt human activities. As a result of the sublimation of their basic nature there arose innumerable divinities; and at the time when the connection between official religions and sexual activity was already hidden from the general consciousness, secret cults devoted themselves to keeping it alive among a number of initiates. In the course of cultural development so much of the divine and sacred was ultimately extracted from sexuality that the exhausted remnant fell into contempt. But in view of the indelibility that is characteristic of all mental traces, it is surely not surprising that even the most primitive forms of genital worship can be shown to have existed in very recent times and that the language, customs and superstitions of mankind today contain survivals from every phase of this process of development.[3]

Impressive analogies from biology have prepared us to find that the

1 [Perverts who enjoy cutting off females' hair.]

2 [The sentence up to this point was added in 1919.]

3 Cf. Knight [1786].

individual's mental development repeats the course of human development in an abbreviated form; and the conclusions which psychoanalytic research into the child's mind has reached concerning the high value set on the genitals in infancy will not therefore strike us as improbable. The child's assumption that his mother has a penis is thus the common source from which are derived the androgynously formed mother goddesses such as the Egyptian Mut and the vultures' '*coda*' in Leonardo's childhood phantasy. It is, in fact, only due to a misunderstanding that we describe these representations of gods as hermaphrodite in the medical sense of the word. In none of them is there a combination of the true genitals of both sexes – a combination which, to the abhorrence of all
[98] beholders, is found in some cases of malformation; all that has happened is that the male organ has been added to the breasts which are the mark of a mother, just as it was present in the child's first idea of his mother's body. This form of the mother's body, the revered creation of primaeval phantasy, has been preserved for the faithful by mythology. We can now provide the following translation of the emphasis given to the vulture's tail in Leonardo's phantasy: 'That was a time when my fond curiosity was directed to my mother, and when I still believed she had a genital organ like my own.' Here is more evidence of Leonardo's early sexual researches, which in our opinion had a decisive effect on the whole of his later life.

At this point a little reflection will remind us that we ought not to feel satisfied yet with the way the vulture's tail in Leonardo's childhood phantasy has been explained. Something more seems to be contained in it which we do not yet understand. Its most striking feature, after all, was that it changed sucking at the mother's breast into being suckled, that is, into passivity, and thus into a situation whose nature is undoubtedly homosexual. When we remember the historical probability of Leonardo having behaved in his life as one who was emotionally homosexual, the question is forced upon us whether this phantasy does not indicate the existence of a causal connection between Leonardo's relation with his mother in childhood and his later manifest, if ideal [sublimated], homosexuality. We should not venture to infer a connection of this sort from Leonardo's distorted reminiscence if we did not know from the psychoanalytic study of homosexual patients that such a connection does exist and is, in fact, an intimate and necessary one.

Homosexual men, who have in our times taken vigorous action against the restrictions imposed by law on their sexual activity, are fond of representing themselves, through their theoretical spokesmen, as being

from the outset a distinct sexual species, as an intermediate sexual stage, as a 'third sex'. They are, they claim, men who are innately compelled by organic determinants to find pleasure in men and have been debarred from obtaining it in women. Much as one would be glad on grounds of humanity to endorse their claims, one must treat their theories with some reserve, for they have been advanced without regard for the psychical genesis of homosexuality. Psychoanalysis offers the means of [99]
filling this gap and of putting the assertions of homosexuals to the test. It has succeeded in the task only in the case of a small number of persons, but all the investigations undertaken so far have yielded the same surprising result.[1] In all our male homosexual cases the subjects had had a very intense erotic attachment to a female person, as a rule their mother, during the first period of childhood, which is afterwards forgotten; this attachment was evoked or encouraged by too much tenderness on the part of the mother herself, and further reinforced by the small part played by the father during their childhood. Sadger emphasizes the fact that the mothers of his homosexual patients were frequently masculine women, women with energetic traits of character, who were able to push the father out of his proper place. I have occasionally seen the same thing, but I was more strongly impressed by cases in which the father was absent from the beginning or left the scene at an early date, so that the boy found himself left entirely under feminine influence. Indeed it almost seems as though the presence of a strong father would ensure that the son made the correct decision in his choice of object, namely someone of the opposite sex.[2]

After this preliminary stage a transformation whose mechanism is [100]
known to us but whose driving forces we do not yet understand sets in. The child's love for his mother cannot continue to develop consciously

1 I refer in particular to the investigations of I. Sadger, which I can in the main confirm from my own experience. I am also aware that Wilhelm Stekel of Vienna and Sándor Ferenczi of Budapest have arrived at the same results.

2 [*Footnote added* 1919:] Psychoanalytic research has contributed two facts that are beyond question to the understanding of homosexuality, without at the same time supposing that it has exhausted the causes of this sexual aberration. The first is the fixation of the erotic needs on the mother which has been mentioned above; the other is contained in the statement that everyone, even the most normal person, is capable of making a homosexual object choice, and has done so at some time in his life, and either still adheres to it in his unconscious or else protects himself against it by vigorous counter-attitudes. These two discoveries put an end both to the claim of homosexuals to be regarded as a 'third sex' and to what has been believed to be the important distinction between innate and acquired homosexuality. The presence of somatic characters of the other sex (the quota provided by physical hermaphroditism) is highly conducive to the homosexual object choice becoming manifest; but it is not decisive. It must be stated with regret that those who speak for the homosexuals in the field of science have been incapable of learning anything from the established findings of psychoanalysis.

any further; it succumbs to repression. The boy represses his love for his mother: he puts himself in her place, identifies himself with her, and takes his own person as a model in whose likeness he chooses the new objects of his love. In this way he has become a homosexual. What he has in fact done is to slip back to auto-erotism: for the boys whom he now loves as he grows up are after all only substitutive figures and revivals of himself in childhood – boys whom he loves in the way in which his mother loved *him* when he was a child. He finds the objects of his love along the path of *narcissism*, as we say; for Narcissus, according to the Greek legend, was a youth who preferred his own reflection to everything else and who was changed into the lovely flower of that name.[1]

Psychological considerations of a deeper kind justify the assertion that a man who has become a homosexual in this way remains unconsciously fixated to the mnemic image of his mother. By repressing his love for his mother he preserves it in his unconscious and from now on remains faithful to her. While he seems to pursue boys and to be their lover, he is in reality running away from the other women, who might cause him to be unfaithful. In individual cases direct observation has also enabled us to show that the man who gives the appearance of being susceptible only to the charms of men is in fact attracted by women in the same way as a normal man; but on each occasion he hastens to transfer the excitation he has received from women on to a male object, and in this manner he repeats over and over again the mechanism by which he acquired his homosexuality.

We are far from wishing to exaggerate the importance of these explanations of the psychical genesis of homosexuality. It is quite obvious that they are in sharp contrast to the official theories of those who
[101] speak for homosexuals, but we know that they are not sufficiently comprehensive to make a conclusive explanation of the problem possible. What is for practical reasons called homosexuality may arise from a whole variety of psychosexual inhibitory processes; the particular process we have singled out is perhaps only one among many, and is perhaps related to only one type of 'homosexuality'. We must also admit that the number of cases of our homosexual type in which it is possible to point to the determinants which we require far exceeds the number of those

1 [Freud's first published reference to narcissism had appeared only a few months before, in a footnote added to the second edition of his *Three Essays* (1905*d*), *RSE*, **7**, 129 *n*., which was published early in 1910. He had mentioned the concept at a meeting of the Vienna Psychoanalytical Society on November 10, 1909. For a full-length discussion of the subject see 'On Narcissism: an Introduction' (1914*c*), ibid., **14**, 63 ff.]

where the deduced effect actually takes place; so that we too cannot reject the part played by unknown constitutional factors, to which the whole of homosexuality is usually traced. We should not have had any cause at all for entering into the psychical genesis of the form of homosexuality we have studied if there were not a strong presumption that Leonardo, whose phantasy of the vulture was our starting point, was himself a homosexual of this very type.[1]

Few details are known about the sexual behaviour of the great artist and scientist, but we may place confidence in the probability that the assertions of his contemporaries were not grossly erroneous. In the light of these traditions, then, he appears as a man whose sexual need and activity were exceptionally reduced, as if a higher aspiration had raised him above the common animal need of mankind. It may remain open to doubt whether he ever sought direct sexual satisfaction – and if so, in what manner – or whether he was able to dispense with it altogether. We are, however, justified in looking in him too for the emotional currents which drive other men imperatively on to perform the sexual act; for we cannot imagine the mental life of any human being in the formation of which sexual desire in the broadest sense – libido – did not have its share, even if that desire has departed far from its original aim, or has refrained from putting itself into effect.

We cannot expect to find in Leonardo anything more than *traces* of untransformed sexual inclination. But these point in one direction and [102]
moreover allow him to be reckoned as a homosexual. It has always been emphasized that he took only strikingly handsome boys and youths as pupils. He treated them with kindness and consideration, looked after them, and when they were ill nursed them himself, just as a mother nurses her children and just as his own mother might have tended him. As he had chosen them for their beauty and not for their talent, none of them – Cesare da Sesto, Boltraffio, Andrea Salaino, Francesco Melzi and others – became a painter of importance. Generally they were unable to make themselves independent of their master, and after his death they disappeared without having left any definite mark on the history of art. The others, whose works entitled them to be called his pupils, like Luini and Bazzi, called Sodoma, he probably did not know personally.

We realize that we shall have to meet the objection that Leonardo's

1 [A more general discussion of homosexuality and its genesis can be found in the first of Freud's *Three Essays* (1905*d*), particularly in a long footnote added between 1910 and 1920, *RSE*, **7**, 129–31. Among other, later, discussions of the subject may be mentioned his case history of a female homosexual (1920*a*), ibid., **18**, 139 ff., and 'Some Neurotic Mechanisms in Jealousy, Paranoia and Homosexuality' (1922*b*), ibid., **18**, 215 ff.]

behaviour towards his pupils has nothing at all to do with sexual motives and that it allows no conclusions to be drawn about his particular sexual inclination. Against this we wish to submit with all caution that our view explains some peculiar features of the artist's behaviour which would otherwise have to remain a mystery. Leonardo kept a diary; he made entries in his small hand (written from right to left) which were meant only for himself. It is noteworthy that in this diary he addressed himself in the second person. 'Learn the multiplication of roots from Master Luca.' (Solmi, 1908, 152.) 'Get Master d'Abacco to show you how to square the circle.' (Loc. cit.) Or on the occasion of a journey: 'I am going to Milan on business to do with my garden . . . Have two baggage trunks made. Get Boltraffio to show you the turning-lathe and get him to polish a stone on it. Leave the book for Master Andrea il Todesco.' (Ibid., 203.)[1] Or a resolution of very different importance: 'You have to show in your treatise that the earth is a star, like the moon or something like it, and thus prove the nobility of our world.' (Herzfeld, 1906, 141.)

In this diary, which, by the way, like the diaries of other mortals, often [103] dismisses the most important events of the day in a few words or else passes them over in complete silence, there are some entries which on account of their strangeness are quoted by all Leonardo's biographers. They are notes of small sums of money spent by the artist – notes recorded with a minute exactness, as if they were made by a pedantically strict and parsimonious head of a household. There is on the other hand no record of the expenditure of larger sums or any other evidence that the artist was at home in keeping accounts. One of these notes has to do with a new cloak which he bought for his pupil Andrea Salaino:[2]

Silver brocade	15	lire	4	soldi
Crimson velvet for trimming	9		–	
Braid	–		9	
Buttons	–		12	

Another very detailed note brings together all the expenses he incurred through the bad character and thievish habits of another pupil:[3] 'On the twenty-first day of April, 1490, I began this book and made a new start on the horse.[4] Jacomo came to me on St Mary Magdalen's day, 1490: he is ten years old.' (Marginal note: 'thievish, untruthful, selfish, greedy.')

1 Leonardo is behaving here like someone whose habit it was to make his daily confession to another person and who uses his diary as a substitute for him. For a conjecture as to who this person may have been, see Merezhkovsky (1903, 367).

2 The text is that given by Merezhkovsky (1903, 282).

3 Or model.

4 For the equestrian statue of Francesco Sforza.

'On the second day I had two shirts cut out for him, a pair of trousers and a jacket, and when I put the money aside to pay for these things, he stole the money from my purse, and it was never possible to make him own up, although I was absolutely sure of it.' (Marginal note: '4 lire . . .') The report of the child's misdeeds runs on in this way and ends with the reckoning of expenses: 'In the first year, a cloak, 2 lire; 6 shirts, 4 lire; 3 jackets, 6 lire; 4 pairs of stockings, 7 lire; etc.'[1]

Nothing is further from the wishes of Leonardo's biographers than to try to solve the problems in their hero's mental life by starting from his small weaknesses and peculiarities; and the usual comment that they make on these singular accounts is one which lays stress on the artist's kindness and consideration for his pupils. They forget that what calls for explanation is not Leonardo's behaviour, but the fact that he left these pieces of evidence of it behind him. As it is impossible to believe that his motive was that of letting proofs of his good nature fall into our hands, [104] we must assume that it was another motive, an affective one, which led him to write these notes down. What motive it was is not easy to guess, and we should be unable to suggest one if there were not another account found among Leonardo's papers which throws a vivid light on these strangely trifling notes about his pupils' clothing, etc.:

Expenses after Caterina's death for her funeral			27	florins
2 pounds of wax			18	
For transporting and erecting the cross			12	
Catafalque			4	
Pall-bearers			8	
For 4 priests and 4 clerks			20	
Bell-ringing			2	
For the grave-diggers			16	
For the licence – to the officials			1	
		TOTAL	108	florins
Previous expenses				
For the doctor	4	florins		
For sugar and candles	12			
			16	florins
		GRAND TOTAL	124	florins.[2]

1 The full text is to be found in Herzfeld (1906, 45).

2 Merezhkovsky (1903, 372). – As a melancholy example of the uncertainty that surrounds the information, which is in any case scanty enough, about Leonardo's private life, I may mention the fact that the same account is quoted by Solmi (1908, 104) with considerable variations. The most serious one is that soldi are given instead of florins. It may be assumed that florins in this account do not mean the old 'gold florins' but the monetary units which were used later and were worth 1$^{2}/_{3}$ lire or 33$^{1}/_{3}$ soldi. Solmi makes Caterina a servant who had looked after Leonardo's household

The novelist Merezhkovsky alone is able to tell us who this Caterina
[105] was. From two other short notes[1] he concludes that Leonardo's mother, the poor peasant woman of Vinci, came to Milan in 1493 to visit her son, who was then 41; that she fell ill there, was taken to hospital by Leonardo, and when she died was honoured by him with this costly funeral.

This interpretation [*Deutung*][T] by the psychological novelist cannot be put to the proof, but it can claim so much inner probability, and is so much in harmony with all that we otherwise know of Leonardo's emotional activity that I cannot refrain from accepting it as correct. He had succeeded in subjecting his feelings to the yoke of research and in inhibiting their free utterance; but even for him there were occasions when what had been suppressed obtained expression forcibly. The death of the mother he had once loved so dearly was one of these. What we have before us in the account of the costs of the funeral is the expression – distorted out of all recognition – of his mourning for his mother. We wonder how such distortion could come about, and indeed we cannot understand it if we treat it as a normal mental process. But similar processes are well known to us in the abnormal conditions of neurosis and especially of what is known as 'obsessional neurosis' [*Zwangsneurose*]. There we can see how the expression of intense feelings, which have however become unconscious through repression,
Verschiebung is displaced [*verschoben*][T] on to trivial and even foolish actions. The expression of these repressed feelings has been lowered by the forces opposed to them to such a degree that one would have had to form a most insignificant estimate of their intensity; but the imperative compulsiveness [*Zwang*] with which this trivial expressive act is performed betrays the real force of the impulses [*Macht der Regungen*][T] – a force which is rooted in the unconscious and which consciousness would like
Verleugnung to disavow [*verleugnen*][T]. Only a comparison such as this with what happens in obsessional neurosis can explain Leonardo's account of the expenses of his mother's funeral. In his unconscious he was still tied to her by erotically coloured feelings, as he had been in childhood. The opposition that came from the subsequent repression of this childhood love did not allow him to set up a different and worthier memorial to

for some time. The source from which the two versions of these accounts were taken was not accessible to me. [The figures given actually vary to some extent in the different editions of Freud's own book. The cost of the catafalque is given in 1910 as '12', in 1919 and 1923 as '19' and from 1925 as '4'. Before 1925 the cost of transporting and erecting the cross was given as '4'. For a later version of the whole text, in Italian and English, see J. P. Richter (1939, **2**, 379).]

1 'Caterina arrived on July 16, 1493.' – 'Giovannina – a fabulous face – Call on Caterina in the hospital and make enquiries.' [The second note is actually mistranslated by Merezhkovsky. It should read: 'Giovannina – a fabulous face – is at the hospital of Santa Caterina.']

her in his diary. But what emerged as a compromise from this neurotic conflict had to be carried out; and thus it was that the account was entered in the diary, and has come to the knowledge of posterity as something unintelligible.

It does not seem a very extravagant step to apply what we have learnt [106]
from the funeral account to the reckonings of the pupils' expenses. They would then be another instance of the scanty remnants of Leonardo's libidinal impulses finding expression in a compulsive manner and in a distorted form. On that view, his mother and his pupils, the likenesses of his own boyish beauty, had been his sexual objects – so far as the sexual repression which dominated his nature allows us so to describe them – and the compulsion to note in laborious detail the sums he spent on them betrayed in this strange way his rudimentary conflicts. From this it would appear that Leonardo's erotic life did really belong to the type of homosexuality whose psychical development we have succeeded in disclosing, and the emergence of the homosexual situation in his phantasy of the vulture would become intelligible to us: for its meaning was exactly what we have already asserted of that type. We should have to translate it thus: 'It was through this erotic relation with my mother that I became a homosexual.'[1]

1 The forms of expression in which Leonardo's repressed libido was allowed to show itself – circumstantiality and concern over money – are among the traits of character which result from anal erotism. See my 'Character and Anal Erotism' (1908*b*) [*RSE*, **9**, 149 ff.].

IV

[107] We have not yet done with Leonardo's vulture phantasy. In words which only too plainly recall a description of a sexual act ('and struck me many times with its tail against[1] my lips'), Leonardo stresses the intensity of the erotic relations between mother and child. From this linking of his mother's (the vulture's) activity with the prominence of the mouth zone it is not difficult to guess that a second memory is contained in the phantasy. This may be translated: 'My mother pressed innumerable passionate kisses on my mouth.' The phantasy is compounded from the memory of being suckled and being kissed by his mother.

Kindly nature has given the artist the ability to express his most secret mental impulses, which are hidden even from himself, by means of the works that he creates; and these works have a powerful effect on others who are strangers to the artist, and who are themselves unaware of the source of their emotion. Can it be that there is nothing in Leonardo's life-work to bear witness to what his memory preserved as the strongest impression of his childhood? One would certainly expect there to be something. Yet if one considers the profound transformations through which an impression in an artist's life has to pass before it is allowed to make its contribution to a work of art, one will be bound to keep any claim to certainty in one's demonstration within very modest limits; and this is especially so in Leonardo's case.

Anyone who thinks of Leonardo's paintings will be reminded of a remarkable smile, at once fascinating and puzzling, which he conjured up on the lips of his female subjects. It is an unchanging smile, on long, curved lips; it has become a mark of his style and the name 'Leonardesque' has been chosen for it.[2] In the strangely beautiful face of the Florentine Mona Lisa del Giocondo it has produced the most powerful and confusing effect on whoever looks at it. [See the frontis-
[108] piece to this volume.] This smile has called for an interpretation, and it has met with many of the most varied kinds, none of which has been

1 [See footnote 1, p. 77 above.]

2 [*Footnote added* 1919:] The connoisseur of art will think here of the peculiar fixed smile found in archaic Greek sculptures – in those, for example, from Aegina; he will perhaps also discover something similar in the figures of Leonardo's teacher Verrocchio and therefore have some misgivings in accepting the arguments that follow.

satisfactory. 'Voilà quatre siècles bientôt que Monna Lisa fait perdre la tête à tous ceux qui parlent d'elle, après l'avoir longtemps regardée.'[1]

Muther (1909, **1**, 314) writes: 'What especially casts a spell on the spectator is the demonic magic of this smile. Hundreds of poets and authors have written about this woman who now appears to smile on us so seductively, and now to stare coldly and without soul into space; and no-one has solved the riddle of her smile, no-one has read the meaning of her thoughts. Everything, even the landscape, is mysteriously dreamlike, and seems to be trembling in a kind of sultry sensuality.'

The idea that two distinct elements are combined in Mona Lisa's smile is one that has struck several critics. They accordingly find in the beautiful Florentine's expression the most perfect representation of the contrasts which dominate the erotic life of women; the contrast between reserve and seduction, and between the most devoted tenderness and a sensuality that is ruthlessly demanding – consuming men as if they were alien beings. This is the view of Müntz (1899, 417): 'On sait quelle énigme indéchiffrable et passionnante Monna Lisa Gioconda ne cesse depuis bientôt quatre siècles de proposer aux admirateurs pressés devant elle. Jamais artiste (j'emprunte la plume du délicat écrivain qui se cache sous le pseudonyme de Pierre de Corlay) "a-t-il traduit ainsi l'essence même de la féminínité: tendresse et coquetterie, pudeur et sourde volupté, tout le mystère d'un coeur qui se réserve, d'un cerveau qui réfléchit, d'une personnalité qui se garde et ne livre d'elle-même que son rayonnement . . .".'[2] The Italian writer Angelo Conti (1910, 93) saw the picture in the Louvre brought to life by a ray of sunshine. 'La donna sorrideva in una calma regale: i suoi istinti di conquista, di ferocia, tutta l'eredità della specie, la volontà della seduzione e dell' agguato, la grazia del inganno, la bontà che cela un proposito crudele, tutto ciò appariva alternativamente e scompariva dietro il velo ridente e si fondeva nel poema del suo sorriso . . . Buona e malvagia, crudele e compassionevole, graziosa e felina, ella rideva . . .'[3] [109]

1 ['For almost four centuries now Mona Lisa has caused all who talk of her, after having gazed on her for long, to lose their heads.'] The words are Gruyer's, quoted by von Seidlitz (1909, **2**, 280).

2 ['We know what an insoluble and enthralling enigma Mona Lisa Gioconda has never ceased through nearly four centuries to pose to the admirers that throng in front of her. No artist (I borrow the words from the sensitive writer who conceals himself behind the pseudonym of Pierre de Corlay) "has ever expressed so well the very essence of femininity: tenderness and coquetry, modesty and secret sensuous joy, all the mystery of a heart that holds aloof, a brain that meditates, a personality that holds back and yields nothing of itself save its radiance".']

3 ['The lady smiled in regal calm: her instincts of conquest, of ferocity, all the heredity of the species, the will to seduce and to ensnare, the charm of deceit, the kindness that conceals a cruel purpose – all this appeared and disappeared by turns behind the laughing veil and buried itself in the poem of her smile . . . Good and wicked, cruel and compassionate, graceful and feline, she laughed . . .']

Leonardo spent four years painting at this picture, perhaps from 1503 to 1507, during his second period of residence in Florence, when he was over fifty. According to Vasari he employed the most elaborate artifices to keep the lady amused during the sittings and to retain the famous smile on her features. In its present condition the picture has preserved but little of all the delicate details which his brush reproduced on the canvas at that time; while it was being painted it was considered to be the highest that art could achieve, but it is certain that Leonardo himself was not satisfied with it, declaring it to be incomplete, and did not deliver it to the person who had commissioned it, but took it to France with him, where his patron, Francis I, acquired it from him for the Louvre.

Let us leave unsolved the riddle of the expression on Mona Lisa's face, and note the indisputable fact that her smile exercised no less powerful a fascination on the artist than on all who have looked at it for the last four hundred years. From that date the captivating smile reappears in all his pictures and in those of his pupils. As Leonardo's Mona Lisa is a portrait, we cannot assume that he added on his own account such an expressive feature to her face – a feature that she did not herself possess. The conclusion seems hardly to be avoided that he found this smile in his model and fell so strongly under its spell that from then on he bestowed it on the free creations of his phantasy. This interpretation, which cannot be called far-fetched, is put forward, for example, by Konstantinowa (1907, 44):

[110] 'During the long period in which the artist was occupied with the portrait of Mona Lisa del Giocondo, he had entered into the subtle details of the features on this lady's face with such sympathetic feeling that he transferred its traits – in particular the mysterious smile and the strange gaze – to all the faces that he painted or drew afterwards. The Gioconda's peculiar facial expression can even be perceived in the picture of John the Baptist in the Louvre; but above all it may be clearly recognized in the expression on Mary's face in the "Madonna and Child with St Anne".'[1] [See the illustration facing this page.]

Yet this situation may also have come about in another way. The need for a deeper reason behind the attraction of La Gioconda's smile, which so moved the artist that he was never again free from it, has been felt by more than one of his biographers. Walter Pater, who sees in the picture of Mona Lisa a 'presence . . . expressive of what in the ways of a thousand years men had come to desire' [1873, 118], and who writes very sensitively of 'the unfathomable smile, always with a touch of something

1 [The title of this subject in German is '*heilige Anna Selbdritt*', literally 'St Anne with Two Others', a point which is referred to below, p. 102.]

Leonardo's 'Madonna and Child with St Anne'

Leonardo's 'Madonna and Child with St Anne'

Freud writes (on p. 103 of the present volume): 'Leonardo's childhood was remarkable in precisely the same way as this picture. He had had two mothers: first, his true mother Caterina, from whom he was torn away when he was between three and five, and then a young and tender stepmother, his father's wife, Donna Albiera.'

sinister in it, which plays over all Leonardo's work' [ibid., 117], leads us to another clue when he declares (loc. cit.):

'Besides, the picture is a portrait. From childhood we see this image defining itself on the fabric of his dreams; and but for express historical testimony, we might fancy that this was but his ideal lady, embodied and beheld at last . . .'

Marie Herzfeld (1906, 88) has no doubt something very similar in mind when she declares that in the Mona Lisa Leonardo encountered his own self and for this reason was able to put so much of his own nature into the picture 'whose features had lain all along in mysterious sympathy within Leonardo's mind'.

Let us attempt to clarify what is suggested here. It may very well have been that Leonardo was fascinated by Mona Lisa's smile for the reason that it awoke something in him which had for long lain dormant in his mind – probably an old memory. This memory was of sufficient importance for him never to get free of it when it had once been aroused; he was continually forced to give it new expression. Pater's confident [111] assertion that we can see, from childhood, a face like Mona Lisa's defining itself on the fabric of his dreams seems convincing and deserves to be taken literally.

Vasari mentions that 'teste di femmine, che ridono'[1] formed the subject of Leonardo's first artistic endeavours. The passage – which, since it is not intended to prove anything, is quite beyond suspicion – runs more fully according to Schorn's translation (1843, **3**, 6): 'In his youth he made some heads of laughing women out of clay, which were reproduced in plaster, and some children's heads which were as beautiful as if they had been modelled by the hand of a master . . .'

Thus we learn that he began his artistic career by portraying two kinds of objects; and these cannot fail to remind us of the two kinds of sexual objects that we have inferred from the analysis of his vulture phantasy. If the beautiful children's heads were reproductions of his own person as it was in his childhood, then the smiling women are nothing other than repetitions of his mother Caterina, and we begin to suspect the possibility that it was his mother who possessed the mysterious smile – the smile that he had lost and that fascinated him so much when he found it again in the Florentine lady.[2]

1 ['Heads of laughing women.'] Quoted by Scognamiglio (1900, 32).

2 The same assumption is made by Merezhkovsky. But the history of Leonardo's childhood as he imagines it departs at the essential points from the conclusions we have drawn from the phantasy of the vulture. Yet if the smile had been that of Leonardo himself [as Merezhkovsky also assumes] tradition would hardly have failed to inform us of the coincidence.

The painting of Leonardo's which stands nearest to the Mona Lisa in point of time is the so-called 'St Anne with Two Others', St Anne with the Madonna and Child. [See the illustration.] In it the Leonardesque smile is most beautifully and markedly portrayed on both the women's faces. It is not possible to discover how long before or after the painting of the Mona Lisa Leonardo began to paint this picture. As both works extended over years, it may, I think, be assumed that the artist was engaged on them at the same time. It would best agree with our expectations if it was the intensity of Leonardo's preoccupation with the features of Mona Lisa which stimulated him to create the composition
[112] of St Anne out of his phantasy. For if the Gioconda's smile called up in his mind the memory of his mother, it is easy to understand how it drove him at once to create a glorification of motherhood, and to give back to his mother the smile he had found in the noble lady. We may therefore permit our interest to pass from Mona Lisa's portrait to this other picture – one which is hardly less beautiful, and which today also hangs in the Louvre.

St Anne with her daughter and her grandchild is a subject that is rarely handled in Italian painting. At all events Leonardo's treatment of it differs widely from all other known versions. Muther (1909, **1**, 309) writes:

'Some artists, like Hans Fries, the elder Holbein and Girolamo dai Libri, made Anne sit beside Mary and put the child between them. Others, like Jakob Cornelisz in his Berlin picture, painted what was truly a "St Anne with Two Others";[1] in other words, they represented her as holding in her arms the small figure of Mary upon which the still smaller figure of the child Christ is sitting.' In Leonardo's picture Mary is sitting on her mother's lap, leaning forward, and is stretching out both arms towards the boy, who is playing with a young lamb and perhaps treating it a little unkindly. The grandmother rests on her hip the arm that is not concealed and gazes down on the pair with a blissful smile. The grouping is certainly not entirely unconstrained. But although the smile that plays on the lips of the two women is unmistakably the same as that in the picture of Mona Lisa, it has lost its uncanny and mysterious character; what it expresses is inward feeling and quiet blissfulness.[2]

After we have studied this picture for some time, it suddenly dawns on us that only Leonardo could have painted it, just as only he could have

1 [I.e. St Anne was the most prominent figure in the picture. See footnote, p. 100 above.]

2 Konstantinowa (1907, [44]): 'Mary gazes down full of inward feeling on her darling, with a smile that recalls the mysterious expression of La Gioconda.' In another passage [ibid., 52] she says of Mary: 'The Gioconda's smile hovers on her features.'

created the phantasy of the vulture. The picture contains the synthesis of the history of his childhood: its details are to be explained by reference to the most personal impressions in Leonardo's life. In his father's house he found not only his kind stepmother, Donna Albiera, but also his [113] grandmother, his father's mother, Monna Lucia, who – so we will assume – was no less tender to him than grandmothers usually are. These circumstances might well suggest to him a picture representing childhood watched over by mother and grandmother. Another striking feature of the picture assumes even greater significance. St Anne, Mary's mother and the boy's grandmother, who must have been a matron, is here portrayed as being perhaps a little more mature and serious than the Virgin Mary, but as still being a young woman of unfaded beauty. In point of fact Leonardo has given the boy two mothers, one who stretches her arms out to him, and another in the background; and both are endowed with the blissful smile of the joy of motherhood. This peculiarity of the picture has not failed to surprise those who have written about it: Muther, for example, is of the opinion that Leonardo could not bring himself to paint old age, lines and wrinkles, and for this reason made Anne too into a woman of radiant beauty. But can we be satisfied with this explanation? Others have had recourse to denying that there is any similarity in age between the mother and daughter.[1] But Muther's attempt at an explanation is surely enough to prove that the impression that St Anne has been made more youthful derives from the picture and is not an invention for an ulterior purpose.

Leonardo's childhood was remarkable in precisely the same way as this picture. He had had two mothers: first, his true mother Caterina, from whom he was torn away when he was between three and five, and then a young and tender stepmother, his father's wife, Donna Albiera. By his combining this fact about his childhood with the one mentioned above (the presence of his mother and grandmother)[2] and by his condensing them into a composite unity, the design of 'St Anne with Two Others' took shape for him. The maternal figure that is further away from the boy – the grandmother – corresponds to the earlier and true mother, Caterina, in its appearance and in its special relation to the boy. The artist seems to have used the blissful smile of St Anne to disavow and to cloak the envy which the unfortunate woman felt when she was

1 Von Seidlitz (1909, **2**, 274, notes).

2 [The words in parentheses were added in 1923.]

[114] forced to give up her son to her better-born rival, as she had once given up his father as well.[1]

We thus find a confirmation in another of Leonardo's works of our suspicion that the smile of Mona Lisa del Giocondo had awakened in

1 [*Footnote added* 1919:] If an attempt is made to separate the figures of Anne and Mary in this picture and to trace the outline of each, it will not be found altogether easy. One is inclined to say that they are fused with each other like badly condensed dream figures, so that in some places it is hard to say where Anne ends and where Mary begins. But what appears to a critic's eye [in 1919 only: 'to an artist's eye'] as a fault, as a defect in composition, is vindicated in the eyes of analysis by reference to its secret meaning. It seems that for the artist the two mothers of his childhood were melted into a single form.

[*Added* 1923:] It is especially tempting to compare the 'St Anne with Two Others' of the Louvre with the celebrated London cartoon, where the same material is used to form a different composition. [See Fig. 2.] Here the forms of the two mothers are fused even more closely and their separate outlines are even harder to make out, so that critics, far removed from any attempt to offer an interpretation, have been forced to say that it seems 'as if two heads were growing from a single body'.

Fig. 2

Most authorities are in agreement in pronouncing the London cartoon to be the earlier work and in assigning its origin to Leonardo's first period in Milan (before 1500). Adolf Rosenberg (1898), on the other hand, sees the composition of the cartoon as a later – and more successful – version of the same theme, and follows Anton Springer [1895] in dating it even after the Mona Lisa. It would fit in excellently with our arguments if the cartoon were to be much the earlier work. It is also not hard to imagine how the picture in the Louvre arose out of the cartoon, while the reverse course of events would make no sense. If we take the composition shown in the cartoon as our starting point, we can see how Leonardo may have felt the need to undo the dreamlike fusion of the two women – a fusion corresponding to his childhood memory – and to separate the two heads in space. This came about as follows: From the group formed by the mothers he detached Mary's head and the upper part of her body and bent them downwards. To provide a reason for this displacement the child Christ had to come down from her lap on to the ground. There was then no room for the little St John, who was replaced by the lamb.

him as a grown man the memory of the mother of his earliest childhood. From that time onwards, madonnas and aristocratic ladies were depicted in Italian painting humbly bowing their heads and smiling the

[*Added* 1919:] A remarkable discovery has been made in the Louvre picture by Oskar Pfister, which is of undeniable interest, even if one may not feel inclined to accept it without reserve. In Mary's curiously arranged and rather confusing drapery he has discovered the *outline of a vulture* and he interprets it as an *unconscious picture-puzzle*:

'In the picture that represents the artist's mother *the vulture, the symbol of motherhood*, is perfectly clearly visible.

'In the length of blue cloth, which is visible around the hip of the woman in front and which extends in the direction of her lap and her right knee, one can see the vulture's extremely characteristic head, its neck and the sharp curve where its body begins. Hardly any observer whom I have confronted with my little find has been able to resist the evidence of this picture-puzzle.' (Pfister, 1913*a*, 147.)

At this point the reader will not, I feel sure, grudge the effort of looking at the accompanying illustration, to see if he can find in it the outlines of the vulture seen by Pfister. The piece of blue cloth, whose border marks the edges of the picture-puzzle, stands out in the reproduction as a light-grey field against the darker ground of the rest of the drapery. [See the illustration facing p. 100 and Fig. 3.]

Fig. 3

Pfister continues: 'The important question however is: How far does the picture-puzzle extend? If we follow the length of cloth, which stands out so sharply from its surroundings, starting at the middle of the wing and continuing from there, we notice that one part of it runs down to the woman's foot, while the other part extends in an upward direction and rests on her shoulder and on the child. The former of these parts might more or less represent the vulture's wing and tail, as it is in nature; the latter might be a pointed belly and – especially when we notice the radiating lines which resemble the outlines of feathers – a bird's outspread tail, whose right-hand end, *exactly as in Leonardo's fateful childhood dream* [sic], *leads to the mouth of the child, i.e. of Leonardo himself*.'

The author goes on to examine the interpretation in greater detail, and discusses the difficulties to which it gives rise.

strange, blissful smile of Caterina, the poor peasant girl who had
[115] brought into the world the splendid son who was destined to paint, to search and to suffer.

If Leonardo was successful in reproducing on Mona Lisa's face the double meaning which this smile contained, the promise of unbounded tenderness and at the same time sinister menace (to quote Pater's phrase [above, pp. 100–1]), then here too he had remained true to the content of his earliest memory. For his mother's tenderness was fateful for him; it determined his destiny and the privations that were in store for him. The
[116] violence of the caresses, to which his phantasy of the vulture points, was only too natural. In her love for her child the poor forsaken mother had to give vent to all her memories of the caresses she had enjoyed as well as her longing for new ones; and she was forced to do so not only to compensate herself for having no husband, but also to compensate her child
[117] for having no father to fondle him. So, like all unsatisfied mothers, she took her little son in place of her husband, and by the too early maturing of his erotism robbed him of a part of his masculinity. A mother's love for the infant she suckles and cares for is something far more profound than her later affection for the growing child. It is in the nature of a completely satisfying love relation, which fulfils not only every mental wish but also every physical need; and if it represents one of the forms of attainable human happiness, that is in no little measure due to the possibility it offers of satisfying, without reproach, wishful impulses which have long been repressed and which must be called perverse.[1] In the happiest young marriage the father is aware that the baby, especially if he is a baby son, has become his rival, and this is the starting point of an antagonism towards the favourite which is deeply rooted in the unconscious.

When, in the prime of life, Leonardo once more encountered the smile of bliss and rapture which had once played on his mother's lips as she fondled him, he had for long been under the dominance of an inhibition which forbade him ever again to desire such caresses from the lips of women. But he had become a painter, and therefore he strove to reproduce the smile with his brush, giving it to all his pictures (whether he in fact executed them himself or had them done by his pupils under his direction) – to Leda, to John the Baptist and to Bacchus. The last two are variants of the same type. 'Leonardo has turned the locust eater of the Bible', says Muther [1909, **1**, 314], 'into a Bacchus, a young Apollo, who, with a mysterious smile on his lips, and with his smooth legs

1 See my *Three Essays on the Theory of Sexuality* (1905*d*) [*RSE*, **7**, 197].

crossed, gazes at us with eyes that intoxicate the senses.' These pictures breathe a mystical air into whose secret one dares not penetrate; at the very most one can attempt to establish their connection with Leonardo's earlier creations. The figures are still androgynous, but no longer in the sense of the vulture phantasy. They are beautiful youths of feminine delicacy and with effeminate forms; they do not cast their eyes down, but gaze in mysterious triumph, as if they knew of a great achievement of happiness, about which silence must be kept. The familiar smile of fascination leads one to guess that it is a secret of love. It is possible that [118] in these figures Leonardo has denied the unhappiness of his erotic life and has triumphed over it in his art, by representing the wishes of the boy, infatuated with his mother, as fulfilled in this blissful union of the male and female natures.

V

[119] Among the entries in Leonardo's notebooks there is one which catches the reader's attention owing to the importance of what it contains and to a minute formal error.

In July, 1504, he writes:

'Adì 9 di Luglio 1504 mercoledi a ore 7 morì Ser Piero da Vinci, notalio al palazzo del Potestà, mio padre, a ore 7. Era d'età d'anni 80, lasciò 10 figlioli maschi e 2 femmine.'[1]

As we see, the note refers to the death of Leonardo's father. The small error in its form consists of the repetition of the time of day 'a ore 7' [at 7 o'clock], which is given twice, as if Leonardo had forgotten at the end of the sentence that he had already written it at the beginning. It is only a small detail, and anyone who was not a psychoanalyst would attach no importance to it. He might not even notice it, and if his attention was drawn to it he might say that a thing like that can happen to anyone in a moment of distraction or of strong feeling, and that it has no further significance.

The psychoanalyst thinks differently. To him nothing is too small to be a manifestation of hidden mental processes. He has learnt long ago that such cases of forgetting or repetition are significant, and that it is the 'distraction' which allows impulses that are otherwise hidden to be revealed.

We would say that this note, like the account for Caterina's funeral [p. 95 above] and the bills of the pupils' expenses [p. 94], is a case in which Leonardo was unsuccessful in suppressing his affect and in which something that had long been concealed forcibly obtained a distorted expression. Even the form is similar: there is the same pedantic exactness, and the same prominence given to numbers.[2]

[120] We call a repetition of this kind a perseveration. It is an excellent means of indicating affective colour. One recalls, for example, St Peter's tirade in Dante's *Paradiso* against his unworthy representative on earth:

1 ['On July 9, 1504, Wednesday at 7 o'clock died Ser Piero da Vinci, notary at the palace of the Podestà, my father, at 7 o'clock. He was 80 years old, and left 10 sons and 2 daughters.'] After Müntz (1899, 13 *n.*).

2 I am leaving on one side a greater error made by Leonardo in this note by giving his father's age as 80 instead of 77. [See also footnote 2, p. 109 below.]

Quegli ch'usurpa in terra il luogo mio,
Il luogo mio, il luogo mio, che vaca
Nella presenza del Figliuol di Dio,

Fatto ha del cimiterio mio cloaca.[1]

Without Leonardo's affective inhibition the entry in his diary might have run somewhat as follows: 'Today at 7 o'clock my father died – Ser Piero da Vinci, my poor father!' But the displacement of the perseveration on to the most indifferent detail in the report of his death, the hour at which he died, robs the entry of all emotion, and further lets us see that here was something to be concealed and suppressed.

Ser Piero da Vinci, notary and descendant of notaries, was a man of great energy who reached a position of esteem and prosperity. He was married four times. His first two wives died childless, and it was only his third wife who presented him with his first legitimate son, in 1476, by which time Leonardo had reached the age of 24 and had long ago exchanged his father's home for the studio of his master Verrocchio. By his fourth and last wife, whom he married when he was already in his fifties, he had nine more sons and two daughters.[2]

It cannot be doubted that his father too came to play an important part in Leonardo's psychosexual development, and not only negatively by his absence during the boy's first childhood years, but also directly by his presence in the later part of Leonardo's childhood. No-one who as a child desires his mother can escape wanting to put himself in his father's place, can fail to identify himself with him in his imagination, and later to make it his task in life to gain ascendancy over him. When Leonardo was received into his grandfather's house before he had reached the age of five, his young stepmother Albiera must certainly have taken his [121]
mother's place where his feelings were concerned, and he must have found himself in what may be called the normal relationship of rivalry with his father. As we know, a decision in favour of homosexuality only takes place round about the years of puberty. When this decision had been arrived at in Leonardo's case, his identification with his father lost all significance for his sexual life, but it nevertheless continued in other spheres of non-erotic activity. We hear that he was fond of magnificence and fine clothes, and kept servants and horses, although, in Vasari's words, 'he possessed almost nothing and did little work'. The

1 ['He who usurps on earth my place, my place, my place, which in the presence of the Son of God is vacant, has made a sewer of the ground where I am buried.'] Canto XXVII, 22–5.

2 Leonardo has apparently made a further mistake in this passage in his diary over the number of his brothers and sisters – a remarkable contrast to the apparent exactness of the passage.

responsibility for these tastes is not to be attributed solely to his feeling for beauty: we recognize in them at the same time a compulsion to copy and to outdo his father. His father had been a great gentleman to the poor peasant girl, and the son, therefore, never ceased to feel the spur to play the great gentleman as well, the urge 'to out-herod Herod',[1] to show his father what a great gentleman really looks like.

There is no doubt that the creative artist feels towards his works like a father. The effect which Leonardo's identification with his father had on his paintings was a fateful one. He created them and then cared no more about them, just as his father had not cared about him. His father's later concern could change nothing in this compulsion; for the compulsion derived from the impressions of the first years of childhood, and what has been repressed and has remained unconscious cannot be corrected by later experiences.

In the days of the Renaissance – and even much later – every artist stood in need of a gentleman of rank, a benefactor and patron, who gave him commissions and in whose hands his fortune rested. Leonardo found his patron in Lodovico Sforza, called Il Moro, a man of ambition and a lover of splendour, astute in diplomacy, but of erratic and unreliable character. At his court in Milan Leonardo passed the most brilliant period of his life, and in his service his creative power attained its most uninhibited expansion, to which the Last Supper and the equestrian statue of Francesco Sforza bore witness. He left Milan before catastrophe overtook Lodovico Sforza, who died a prisoner in a French dungeon.
[122] When the news of his patron's fate reached Leonardo, he wrote in his diary: 'The duke lost his dukedom and his property and his liberty, and none of the works that he undertook was completed.'[2] It is remarkable, and certainly not without significance, that he here cast the same reproach at his patron which posterity was to bring against himself. It is as if he wanted to make someone from the class of his fathers responsible for the fact that he himself left his works unfinished. In point of fact he was not wrong in what he said about the duke.

But if his imitation of his father did him damage as an artist, his rebellion against his father was the infantile determinant of what was perhaps an equally sublime achievement in the field of scientific research. In Merezhkovsky's admirable simile (1903, 348), he was like a man who had awoken too early in the darkness, while everyone else was still asleep. He

1 [The last three words are in English in the original.]

2 'Il duca perse lo stato e la roba e libertà e nessuna sua opera si finì per lui.' Quoted by von Seidlitz (1909, **2**, 270).

dared to utter the bold assertion which contains within itself the justification for all independent research: '*He who appeals to authority when there is a difference of opinion works with his memory rather than with his reason*.'[1] Thus he became the first modern natural scientist, and an abundance of discoveries and suggestive ideas rewarded his courage for being the first man since the time of the Greeks to probe the secrets of nature while relying solely on observation and his own judgement. But in teaching that authority should be looked down on and that imitation of the 'ancients' should be repudiated, and in constantly urging that the study of nature was the source of all truth, he was merely repeating – in the highest sublimation attainable by man – the one-sided point of view which had already forced itself on the little boy as he gazed in wonder on the world. If we translate scientific abstraction back again into concrete individual experience, we see that the 'ancients' and authority simply correspond to his father, and nature once more becomes the tender and kindly mother who had nourished him. In most other human beings – no less today than in primaeval times – the need for support from an authority of some sort is so compelling that their world begins to totter if that authority is threatened. Only Leonardo could dispense with that support; he would not have been able to do so had he not learnt in the first years of his life to do without his father. His later scientific research, with all its boldness and independence, presupposed the existence of infantile sexual researches uninhibited by his father, and was a prolongation of them with the sexual element excluded. [123]

When anyone has, like Leonardo, escaped being intimidated by his father during his earliest[2] childhood, and has in his researches cast away the fetters of authority, it would be in the sharpest contradiction to our expectation if we found that he had remained a believer and had been unable to escape from dogmatic religion. Psychoanalysis has made us familiar with the intimate connection between the father complex and belief in God; it has shown us that a personal God is, psychologically, nothing other than an exalted father, and it brings us evidence every day of how young people lose their religious beliefs as soon as their father's authority breaks down. Thus we recognize that the roots of the need for religion are in the parental complex; the almighty and just God, and kindly Nature, appear to us as grand sublimations of father and mother, or rather as revivals and restorations of the young child's ideas of them.

1 'Chi disputa allegando l'autorità non adopra l'ingegno ma piuttosto la memoria.' Quoted by Solmi (1910, 13). [Codex Atlanticus, F. 76r.a.]

2 [This word was added in 1925.]

Biologically speaking, religiousness is to be traced to the small human child's long-drawn-out helplessness and need of help; and when at a later date he perceives how truly forlorn and weak he is when confronted with the great forces of life, he feels his condition as he did in childhood, and attempts to deny his own despondency by a regressive revival of the forces which protected his infancy. The protection against neurotic illness, which religion vouchsafes to those who believe in it, is easily explained: it removes their parental complex, on which the sense of guilt in individuals as well as in the whole human race depends, and disposes of it, while the unbeliever has to grapple with the problem on his own.[1]

[124] It does not seem as if the instance of Leonardo could show this view of religious belief to be mistaken. Accusations charging him with unbelief or (what at that time came to the same thing) with apostasy from Christianity were brought against him while he was still alive, and are clearly described in the first biography which Vasari [1550] wrote of him. (Müntz, 1899, 292. ff.) In the second (1568) edition of his *Vite* Vasari omitted these observations. In view of the extraordinary sensitiveness of his age where religious matters were in question, we can understand perfectly why even in his notebooks Leonardo should have refrained from directly stating his attitude to Christianity. In his researches he did not allow himself to be led astray in the slightest degree by the account of the Creation in Holy Writ; he challenged, for example, the possibility of a universal Deluge, and in geology he calculated in terms of hundreds of thousands of years with no more hesitation than men in modern times.

Among his 'prophecies' there are some things that would have been bound to offend the sensitive feelings of a Christian believer. Take for example, 'On the practice of praying to the images of saints':

'Men will speak to men that perceive nothing, that have their eyes open and see nothing; they will talk to them and receive no answer; they will implore the grace of those that have ears and hear not; they will kindle lights for one that is blind.' (After Herzfeld, 1906, 292.)

Or 'On the mourning on Good Friday':

'In every part of Europe great peoples will weep for the death of a single man who died in the East.' (Ibid., 297.)

The view has been expressed about Leonardo's art that he took from the sacred figures the last remnant of their connection with the Church and made them human, so as to represent by their means great and

1 [This last sentence was added in 1919. – The same point is mentioned in Freud's contemporary address to the Nuremberg Congress (1910*d*), p. 133 below, and again, much later, in *Group Psychology* (1921*c*), *RSE*, **18**, *The Future of an Illusion* (1927*c*), ibid., **21**, and *Civilization and its Discontents* (1930*a*), ibid., **21**.]

beautiful human emotions. Muther praises him for overcoming the prevailing mood of decadence and for restoring to man his right to sensuality and the joy of living. In the notes that show Leonardo engrossed in fathoming the great riddles of nature there is no lack of passages where he expresses his admiration for the Creator, the ultimate cause of all these noble secrets; but there is nothing which indicates that he wished to maintain any personal relation with this divine power. The reflections in which he has recorded the deep wisdom of his last years of life breathe the resignation of the human being who subjects himself to [125]
'Ανάγκη, to the laws of nature, and who expects no alleviation from the goodness or grace of God. There is scarcely any doubt that Leonardo had prevailed over both dogmatic and personal religion, and had by his work of research removed himself far from the position from which the Christian believer surveys the world.

The findings, mentioned above [p. 87 ff.], which we have reached concerning the development of the mental life of children suggest the view that in Leonardo's case too the first researches of childhood were concerned with the problems of sexuality. Indeed he himself gives this away in a transparent disguise by connecting his urge for research with the vulture phantasy, and by singling out the problem of the flight of birds as one to which, as the result of a special chain of circumstances, he was destined to turn his attention. A highly obscure passage in his notes which is concerned with the flight of birds, and which sounds like a prophecy, gives a very good demonstration of the degree of affective interest with which he clung to his wish to succeed in imitating the art of flying himself: 'The great bird will take its first flight from the back of its Great Swan; it will fill the universe with stupefaction, and all writings with renown, and be the eternal glory of the nest where it was born.'[1] He probably hoped that he himself would be able to fly one day, and we know from wish-fulfilling dreams what bliss is expected from the fulfilment of that hope.

But why do so many people dream of being able to fly? The answer that psychoanalysis gives is that to fly or to be a bird is only a disguise for another wish, and that more than one bridge, involving words or things, leads us to recognize what it is. When we consider that inquisitive children are told that babies are brought by a large bird, such as the stork; when we find that the ancients represented the phallus as having wings; that the commonest expression in German for male sexual

1 After Herzfeld (1906, 32). 'The Great Swan' seems to mean Monte Cecero, a hill near Florence [now Monte Ceceri: '*Cecero*' is Italian for 'swan'].

activity is '*vögeln*' ['to bird': '*Vogel*' is the German for 'bird']; that the male organ is actually called '*l'uccello*' ['the bird'] in Italian – all of these are only small fragments from a whole mass of connected ideas,
[126] from which we learn that in dreams the wish to be able to fly is to be understood as nothing else than a longing to be capable of sexual performance.[1] This is an early infantile wish. When an adult recalls his childhood it seems to him to have been a happy time, in which one enjoyed the moment and looked to the future without any wishes; it is for this reason that he envies children. But if children themselves were able to give us information earlier[2] they would probably tell a different story. It seems that childhood is not the blissful idyll into which we
Nachträglichkeit distort it[3] in retrospect [*nachträglich*][T], and that, on the contrary, children are goaded on through the years of childhood by the one wish to get big and do what grown-ups do. This wish is the motive of all their games. Whenever children feel in the course of their sexual researches that in the province which is so mysterious but nevertheless so important there is something wonderful of which adults are capable but which *they* are forbidden to know of and do, they are filled with a violent wish to be able to do it, and they dream of it in the form of flying, or they prepare this disguise of their wish to be used in their later flying dreams. Thus aviation, too, which in our day is at last achieving its aim, has its infantile erotic roots.

In admitting to us that ever since his childhood he felt bound up in a special and personal way with the problem of flight, Leonardo gives us confirmation that his childhood researches were directed to sexual matters; and this is what we were bound to expect as a result of our investigations on children in our own time. Here was one problem at least which had escaped the repression that later estranged him from sexuality. With slight changes in meaning, the same subject continued to interest him from his years of childhood until the time of his most complete intellectual maturity; and it may very well be that the skill that he desired was no more attainable by him in its primary sexual sense than in its mechanical one, and that he remained frustrated in both wishes.

1 [*Footnote added* 1919:] This statement is based on the researches of Paul Federn [1914] and of Mourly Vold (1912), a Norwegian man of science who had no contact with psychoanalysis. [See also *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 353.]

2 ['*früher*.' In the editions before 1923 '*darüber*' appears in place of '*früher*', giving the meaning 'about it'.]

3 [The 'it' here corresponds to '*es*' in the original German, instead of '*sie*'. This is erroneous usage as '*es*' refers to the idyll rather than to childhood.]

Indeed, the great Leonardo remained like a child for the whole of his [127]
life in more than one way; it is said that all great men are bound to retain some infantile part. Even as an adult he continued to play, and this was another reason why he often appeared uncanny [*unheimlich*] and incomprehensible to his contemporaries. It is only we who are unsatisfied that he should have constructed the most elaborate mechanical toys for court festivities and ceremonial receptions, for we are reluctant to see the artist turning his power to such trifles. He himself seems to have shown no unwillingness to spend his time thus, for Vasari tells us that he made similar things when he had not been commissioned to do so: 'There (in Rome) he got a soft lump of wax, and made very delicate animals out of it, filled with air; when he blew into them they flew around, and when the air ran out they fell to the ground. For a peculiar lizard which was found by the wine-grower of Belvedere he made wings from skin torn from other lizards, and filled them with quicksilver, so that they moved and quivered when it walked. Next he made eyes, a beard and horns for it, tamed it and put it in a box and terrified all his friends with it.'[1] Such ingenuities often served to express thoughts of a serious kind. 'He often had a sheep's intestines cleaned so carefully that they could have been held in the hollow of the hand. He carried them into a large room, took a pair of blacksmith's bellows into an adjoining room, fastened the intestines to them and blew them up, until they took up the whole room and forced people to take refuge in a corner. In this way he showed how they gradually became transparent and filled with air; and from the fact that at first they were limited to a small space and gradually spread through the whole breadth of the room, he compared them to genius.'[2] The same playful delight in harmlessly concealing things and giving them ingenious disguises is illustrated by his fables and riddles. The latter are cast into the form of 'prophecies': almost all are rich in ideas and to a striking degree devoid of any element of wit.

The games and pranks which Leonardo allowed his imagination have in some cases led his biographers, who misunderstood this side of his character, grievously astray. In Leonardo's Milanese manuscripts there [128]
are, for example, some drafts of letters to the 'Diodario of Sorio (Syria), Viceroy of the Holy Sultan of Babylonia', in which Leonardo presents himself as an engineer sent to those regions of the East to construct certain works; defends himself against the charge of laziness; supplies geographical descriptions of towns and mountains, and concludes with

1 Vasari, from Schorn's translation (1843, [39]) [ed. Poggi, 1919, 41].

2 Ibid., 39 [ed. Poggi, 41].

an account of a great natural phenomenon that occurred while he was there.[1]

In 1883 an attempt was made by J. P. Richter to prove from these documents that it was really a fact that Leonardo had made these observations while travelling in the service of the Sultan of Egypt, and had even adopted the Mohammedan religion when in the East. On this view his visit there took place in the period before 1483 – that is, before he took up residence at the court of the Duke of Milan. But the acumen of other authors has had no difficulty in recognizing the evidences of Leonardo's supposed Eastern journey for what they are – imaginary productions of the youthful artist, which he created for his own amusement and in which he may have found expression for a wish to see the world and meet with adventures.

Another probable example of a creation of his imagination is to be found in the 'Academia Vinciana' which has been postulated from the existence of five or six emblems, intertwined patterns of extreme intricacy, which contain the Academy's name. Vasari mentions these designs but not the Academy.[2] Müntz, who put one of these ornaments on the cover of his large work on Leonardo, is among the few who believe in the reality of an 'Academia Vinciana'.

It is probable that Leonardo's drive to play [*Spieltrieb*] vanished in his maturer years, and that it too found its way into the activity of research
[129] which represented the latest and highest expansion of his personality. But its long duration can teach us how slowly anyone tears himself from his childhood if in his childhood days he has enjoyed the highest erotic bliss, which is never again attained.

1 For these letters and the various questions connected with them see Müntz (1899, 82 ff.); the actual texts and other related notes can be found in Herzfeld (1906, 223 ff.).

2 'Besides, he lost some time by even making a drawing of knots of cords, in which it was possible to trace the thread from one end to the other until it formed a completely circular figure. A very complex and beautiful design of this sort is engraved on copper; in the middle can be read the words "Leonardus Vinci Academia".' Schorn (1843, 8) [ed. Poggi, 5].

VI

It would be futile to blind ourselves to the fact that readers today find all [130]
pathography unpalatable. They clothe their aversion in the complaint that a pathographical review of a great man never results in an understanding of his importance and his achievements, and that it is therefore a piece of useless impertinence to make a study of things in him that could just as easily be found in the first person one came across. But this criticism is so manifestly unjust that it is only understandable when taken as a pretext and a disguise. Pathography does not in the least aim at making the great man's achievements intelligible; and surely no-one should be blamed for not carrying out something he has never promised to do. The real motives for the opposition are different. We can discover them if we bear in mind that biographers are fixated on their heroes in a quite special way. In many cases they have chosen their hero as the subject of their studies because – for reasons of their personal emotional life – they have felt a special affection for him from the very first. They then devote their energies to a task of idealization, aimed at enrolling the great man among the class of their infantile models – at reviving in him, perhaps, the child's idea of his father. To gratify this wish they obliterate the individual features of their subject's physiognomy; they smooth over the traces of his life's struggles with internal and external resistances, and they tolerate in him no vestige of human weakness or imperfection. They thus present us with what is in fact a cold, strange, ideal figure, instead of a human being to whom we might feel ourselves distantly related. That they should do this is regrettable, for they thereby sacrifice truth to an illusion, and for the sake of their infantile phantasies abandon the opportunity of penetrating the most fascinating secrets of human nature.[1]

Leonardo himself, with his love of truth and his thirst for knowledge, would not have discouraged an attempt to take the trivial peculiarities and riddles in his nature as a starting point for discovering what [131]
determined his mental and intellectual development. We do homage to him by learning from him. It does not detract from his greatness if we make a study of the sacrifices which his development from childhood

1 This criticism applies quite generally and is not to be taken as being aimed at Leonardo's biographers in particular.

must have entailed, and if we bring together the factors which have stamped him with the tragic mark of failure.

We must expressly insist that we have never reckoned Leonardo as a neurotic or a 'nerve case', as the awkward phrase goes. Anyone who protests at our so much as daring to examine him in the light of discoveries gained in the field of pathology is still clinging to prejudices which we have today rightly abandoned. We no longer think that health and illness, normal and neurotic people, are to be sharply distinguished from each other, and that neurotic traits must necessarily be taken as proofs of a general inferiority. Today we know that neurotic symptoms are structures which are substitutes for certain achievements of repression that we have to carry out in the course of our development from a child to a civilized human being. We know too that we all produce such substitutive structures, and that it is only their number, intensity and distribution which justify us in using the practical concept of illness and in inferring the presence of constitutional inferiority. From the slight indications we have about Leonardo's personality we should be inclined to place him close to the type of neurotic that we describe as 'obsessional' [*Zwangstypus*]; and we may compare his researches to the 'obsessive brooding' of neurotics, and his inhibitions to what are known as their 'abulias'.

The aim of our work has been to explain the inhibitions in Leonardo's sexual life and in his artistic activity. With this in view we may be allowed to summarize what we have been able to discover about the course of his psychical development.

We have no information about the circumstances of his heredity; on the other hand we have seen that the accidental conditions of his childhood had a profound and disturbing effect on him. His illegitimate birth deprived him of his father's influence until perhaps his fifth year, and left him open to the tender seductions of a mother whose only solace he was. After being kissed by her into precocious sexual maturity, he must no doubt have embarked on a phase of infantile sexual activity of which
[132] only one single manifestation is definitely attested – the intensity of his infantile sexual researches. The drive to look and the drive to know [*Schau- und Wisstrieb*] were those most strongly excited by the impressions of his early childhood; the erotogenic zone of the mouth was given an emphasis which it never afterwards surrendered. From his later behaviour in the contrary direction, such as his exaggerated sympathy for animals, we can conclude that there was no lack of strong sadistic traits in this period of his childhood.

A powerful wave of repression brought this childhood excess to an end, and established the dispositions which were to become manifest in the years of puberty. The most obvious result of the transformation was the avoidance of every crudely sensual activity; Leonardo was enabled to live in abstinence and to give the impression of being an asexual human being. When the excitations of puberty came in their flood upon the boy they did not, however, make him ill by forcing him to develop substitutive structures of a costly and harmful kind. Owing to his very early inclination towards sexual curiosity the greater portion of the needs of his sexual drive could be sublimated into a general urge to know [*Wissensdrang*], and thus evaded repression. A much smaller portion of his libido continued to be devoted to sexual aims and represented a stunted adult sexual life. Because his love for his mother had been repressed, this portion was driven to take up a homosexual attitude and manifested itself in ideal love for boys. The fixation on his mother and on the blissful memories of his relations with her continued to be preserved in the unconscious, but for the time being it remained in an inactive state. In this way repression, fixation and sublimation all played their part in disposing of the contributions which the sexual drive made to Leonardo's mental life.

Leonardo emerges from the obscurity of his boyhood as an artist, a painter and a sculptor, owing to a specific talent which may have been reinforced by the precocious awakening in the first years of childhood of his scopophilic drive [*Schautriebes*]. We should be most glad to give an account of the way in which artistic activity derives from the primal drives of the mind [*seelischen Urtriebe*] if it were not just here that our capacities fail us. We must be content to emphasize the fact – which it is hardly any longer possible to doubt – that what an artist creates provides at the same time an outlet for his sexual desire; and in Leonardo's case we can point to the information which comes from Vasari [above, p. 101], that heads of laughing women and beautiful boys – in other words, representations of his sexual objects – were notable among his first artistic endeavours. In the bloom of his youth Leonardo appears at first to have worked without inhibition. Just as he modelled himself on his father in the outward conduct of his life, so too he passed through a period of masculine creative power and artistic productiveness in Milan, where a kindly fate enabled him to find a father substitute in the duke Lodovico Moro. But soon we find confirmation of our experience that the almost total suppression of a real sexual life does not provide the most favourable conditions for the exercise of sublimated sexual [133]

trends. The pattern imposed by sexual life made itself felt. His activity and his ability to form quick decisions began to fail; his tendency towards deliberation and delay was already noticeable as a disturbing element in the 'Last Supper', and by influencing his technique it had a decisive effect on the fate of that great painting. Slowly there occurred in him a process which can only be compared to the regressions in neurotics. The development that turned him into an artist at puberty was overtaken by the process which led him to be an investigator, and which had its determinants in early infancy. The second sublimation of his erotic drive gave place to the original sublimation for which the way had been prepared on the occasion of the first repression. He became an investigator, at first still in the service of his art, but later independently of it and away from it. With the loss of his patron, the substitute for his father, and with the increasingly sombre colours which his life took on, this regressive shift assumed larger and larger proportions. He became '*impacientissimo al pennello*',[1] as we are told by a correspondent of the Countess Isabella d'Este, who was extremely eager to possess a painting from his hand. His infantile past had gained control over him. But the research which now took the place of artistic creation seems to have contained some of the features which distinguish the activity of unconscious drives – insatiability, unyielding rigidity and the lack of an ability to adapt to real circumstances.

[134] At the summit of his life, when he was in his early fifties – a time when in women the sexual characters have already undergone involution and when in men the libido not infrequently makes a further energetic advance – a new transformation came over him. Still deeper layers of the contents of his mind became active once more; but this further regression was to the benefit of his art, which was in the process of becoming stunted. He met the woman who awakened his memory of his mother's happy smile of sensual rapture; and, influenced by this revived memory, he recovered the stimulus that guided him at the beginning of his artistic endeavours, at the time when he modelled the smiling women. He painted the Mona Lisa, the 'St Anne with Two Others' and the series of mysterious pictures which are characterized by the enigmatic smile. With the help of the oldest of all his erotic impulses he enjoyed the triumph of once more conquering the inhibition in his art. This final development is obscured from our eyes in the shadows of approaching age. Before this his intellect had soared upwards to the highest realizations of a conception of the world that left his epoch far behind it.

1 ['Very impatient of painting.'] Von Seidlitz (1909, **2**, 271).

In the preceding chapters I have shown what justification can be found for giving this picture of Leonardo's course of development – for proposing these subdivisions of his life and for explaining his vacillation between art and science in this way. If in making these statements I have provoked the criticism, even from friends of psychoanalysis and from those who are expert in it, that I have merely written a psychoanalytic novel, I shall reply that I am far from overestimating the certainty of these results. Like others I have succumbed to the attraction of this great and mysterious man, in whose nature one seems to detect powerful driven passions which can nevertheless only express themselves in so remarkably subdued a manner.

But whatever the truth about Leonardo's life may be, we cannot desist from our endeavour to find a psychoanalytic explanation for it until we have completed another task. We must stake out in a quite general way the limits which are set to what psychoanalysis can achieve in the field of biography: otherwise every explanation that is not forthcoming will be held up to us as a failure. The material at the disposal of a psychoanalytic enquiry consists of the data of a person's life history: on the one hand, the [135] chance circumstances of events and background influences, and, on the other hand, the subject's reported reactions. Supported by its knowledge of psychical mechanisms it then endeavours to establish a dynamic basis for his nature on the strength of his reactions, and to disclose the original driving forces of his mind, as well as their later transformations and developments. If this is successful the behaviour of a personality in the course of his life is explained in terms of the combined operation of constitution and fate, of internal forces and external powers. Where such an undertaking does not provide any certain results – and this is perhaps so in Leonardo's case – the blame rests not with the faulty or inadequate methods of psychoanalysis, but with the uncertainty and fragmentary nature of the material relating to him which tradition makes available. It is therefore only the author who is to be held responsible for the failure, by having forced psychoanalysis to pronounce an expert opinion on the basis of such insufficient material.

But even if the historical material at our disposal were very abundant, and if the psychical mechanisms could be dealt with with the greatest assurance, there are two important points at which a psychoanalytic enquiry would not be able to make us understand how inevitable it was that the person concerned should have turned out in the way he did and in no other way. In Leonardo's case we have had to maintain the view that the accident of his illegitimate birth and the excessive tenderness of

his mother had the most decisive influence on the formation of his character and on his later fortune, since the sexual repression which set in after this phase of childhood caused him to sublimate his libido into the urge to know, and established his sexual inactivity for the whole of his later life. But this repression after the first erotic satisfactions of childhood need not necessarily have taken place; in someone else it might perhaps not have taken place or might have assumed much less extensive proportions. We must recognize here a degree of freedom which cannot be resolved any further by psychoanalytic means. Equally, one has no right to claim that the consequence of this wave of repression was the only possible one. It is probable that another person would not have succeeded in withdrawing the major portion of his libido from
[136] repression by sublimating it into a craving for knowledge; under the same influences he would have sustained a permanent injury to his intellectual activity or have acquired an insurmountable disposition to obsessional neurosis. We are left, then, with these two characteristics of Leonardo which are inexplicable by the efforts of psychoanalysis: his quite special tendency towards drive repressions, and his extraordinary capacity for sublimating the primitive drives.

Drives and their transformations are at the limit of what is discernible by psychoanalysis. From that point it gives place to biological research. We are obliged to look for the source of the tendency to repression and the capacity for sublimation in the organic foundations of character on which the mental structure is only afterwards erected. Since artistic talent and capacity are intimately connected with sublimation we must admit that the nature of the artistic function is also inaccessible to us along psychoanalytic lines. The tendency of biological research today is to explain the chief features in a person's organic constitution as being the result of the blending of male and female dispositions, based on [chemical] substances. Leonardo's physical beauty and his left-handedness might be quoted in support of this view.[1] We will not, however, leave the ground of purely psychological research. Our aim remains that of demonstrating the connection along the path of drive activity between a person's external experiences and his reactions. Even if psychoanalysis does not throw light on the fact of Leonardo's artistic power, it at least renders its manifestations and its limitations intelligible to us. It seems at any rate as if only a man who had had Leonardo's

1 [This is no doubt an allusion to the views of Fliess by which Freud had been greatly influenced. Cf. his *Three Essays* (1905*d*), *RSE*, **7**, 191 *n*. 1. On the particular question of bilaterality, however, they had not been in complete agreement. See above, p. 57 *n*.]

childhood experiences could have painted the Mona Lisa and the St Anne, have secured so melancholy a fate for his works and have embarked on such an astonishing career as a natural scientist, as if the key to all his achievements and misfortunes lay hidden in the childhood phantasy of the vulture.

But may one not take objection to the findings of an enquiry which ascribes to accidental circumstances of his parental constellation so [137] decisive an influence on a person's fate – which, for example, makes Leonardo's fate depend on his illegitimate birth and on the barrenness of his first stepmother Donna Albiera? I think one has no right to do so. If one considers chance to be unworthy of determining our fate, it is simply a relapse into the pious view of the universe which Leonardo himself was on the way to overcoming when he wrote that the sun does not move [p. 72 above]. We naturally feel hurt that a just God and a kindly providence do not protect us better from such influences during the most defenceless period of our lives. At the same time we are all too ready to forget that in fact everything to do with our life is chance, from our origin out of the meeting of spermatozoon and ovum onwards – chance which nevertheless has a share in the law and necessity of nature, and which merely lacks any connection with our wishes and illusions. The apportioning of the determining factors of our life between the 'necessities' of our constitution and the 'chances' of our childhood may still be uncertain in detail; but in general it is no longer possible to doubt the importance precisely of the first years of our childhood. We all still show too little respect for Nature which (in the obscure words of Leonardo which recall Hamlet's lines) 'is full of countless causes ['*ragioni*'] that never enter experience'.[1]

Every one of us human beings corresponds to one of the countless experiments in which these '*ragioni*' of nature force their way into experience.

1 '*La natura è piena d'infinite ragioni che non furono mai in isperienza*' (Herzfeld, 1906, 11). – [The allusion seems to be to Hamlet's familiar words:

There are more things in heaven and earth, Horatio,
Than are dreamt of in your philosophy.]

THE FUTURE PROSPECTS OF PSYCHOANALYTIC THERAPY

The present translation is a revised and corrected reprint of the *SE* version.

This paper was delivered as an address at the opening of the Second Psychoanalytical Congress, held at Nuremberg on March 30 and 31, 1910. As a general survey of the contemporary position of psychoanalysis, it may be compared with the similar address 'Lines of Advance in Psychoanalytic Therapy' (1919*a*) delivered by Freud eight years later at the Budapest Congress. In particular, the second part of the present paper, dealing with technique, foreshadows the 'active' therapy which was the main theme of the later one.

THE FUTURE PROSPECTS OF PSYCHOANALYTIC THERAPY

Gentlemen, since the objects for which we are assembled here today are [141]
mainly practical, I shall choose a practical theme for my introductory address and appeal to your medical, not to your scientific, interest. I can imagine your probable views on the results of our therapy, and I assume that most of you have already passed through the two stages which all beginners go through, the stage of enthusiasm at the unexpected increase in our therapeutic achievements, and the stage of depression at the magnitude of the difficulties which stand in the way of our efforts. At whatever point in this development, however, each of you may happen to be, my intention today is to show you that we have by no means come to the end of our resources for combating the neuroses, and that we may expect a substantial improvement in our therapeutic prospects before long.

This reinforcement will come, I think, from three directions:

(1) from internal progress,
(2) from increased authority, and
(3) from the general effect of our work.

(1) Under 'internal progress' I include advances (*a*) in our analytic knowledge, (*b*) in our technique.

(*a*) Advances in our knowledge. We are, of course, still a long way from knowing all that is required for an understanding of the unconscious in our patients. It is clear that every advance in our knowledge means an increase in our therapeutic power. As long as we have understood nothing, we have accomplished nothing; the more we understand, the more we shall achieve. At its beginning psychoanalytic treatment was inexorable and exhausting. The patient had to say everything himself, and the physician's activity consisted of urging him on incessantly. Today things have a more friendly air. The treatment is made up of two parts – what the physician infers and tells the patient, and the patient's working over of what he has heard. The mechanism of our assistance is [142]
easy to understand: we give the patient the conscious anticipatory idea

[the idea of what he may expect to find] and he then finds the repressed
Verdrängung [*verdrängte*][T] unconscious idea in himself on the basis of its similarity to the anticipatory one.[1] This is the intellectual help which makes it easier for him to overcome the resistances between conscious and unconscious. Incidentally, I may remark that it is not the only mechanism made use of in analytic treatment; you all know the far more powerful one which lies in the use of the 'transference' ['*Übertragung*'][T]. It is my intention in the near future to deal with these various factors, which are so important for an understanding of the treatment, in an *Allgemeine Methodik der Psychoanalyse*.[2] And further, in speaking to you I need not rebut the objection that the evidential value in support of the correctness of our hypotheses is obscured in our treatment as we practise it today; you will not forget that this evidence is to be found elsewhere, and that a therapeutic procedure cannot be carried out in the same way as a theoretical investigation.

Let me now touch upon one or two fields in which we have new things to learn and do, in fact, discover new things every day. Above all, there is the field of symbolism in dreams and in the unconscious – a fiercely contested subject, as you know. It is no small merit in our colleague, Wilhelm Stekel, that, untroubled by all the objections raised by our opponents, he has undertaken a study of dream symbols. There is indeed still much to
Deutung learn here; my *Interpretation of Dreams* [*Traumdeutung*][T], which was written in 1899, awaits important amplification from researches into symbolism.[3]

[143] I will say a few words about one of the symbols that has newly been recognized. A little time ago I heard that a psychologist whose views are somewhat different from ours had remarked to one of us that, when all was said and done, we did undoubtedly exaggerate the hidden sexual

1 [See, however, below, pp. 216–17. The present point had been explained rather more fully in Freud's paper on 'Little Hans' (1909*b*), *RSE*, **10**, 92–3. He returned to it in his technical paper 'On Beginning the Treatment' (1913*c*), ibid., **12**, 137–8 and *n.* 2. The metapsychology of the process of interpretation is discussed at length in Sections II and VII of the paper on 'The Unconscious' (1915*e*), ibid., **14**, 155 and 177.]

2 [*General Methodology of Psychoanalysis* – a systematic work on psychoanalytic technique, planned and at least partly written by Freud in 1908 and 1909, but never published. Some years later (from 1911 onwards) he published a number of separate papers on technique which can be found collected in *RSE*, **12**.]

3 [Stekel published a paper on dream interpretation in 1909 and a large book on the same subject in 1911. Freud gave some account of the effect of these on him in a passage added to *The Interpretation of Dreams* (1900*a*) in 1925 (*RSE*, **5**, 313). A further commentary on this can be found in the Editors' Introduction to that work (ibid., **4**, xvi f.). The second edition of *The Interpretation of Dreams* had been published in 1909, and had been prepared by Freud during the summer of 1908. In this, and still more in the third edition (1911), the section on symbolism was very considerably enlarged.]

significance of dreams: his own commonest dream was of going upstairs, and surely there could not be anything sexual in *that*. We were put on the alert by this objection, and began to turn our attention to the appearance of steps, staircases and ladders in dreams, and were soon in a position to show that staircases (and analogous things) were unquestionably symbols of copulation. It is not hard to discover the basis of the comparison: we come to the top in a series of rhythmical movements and with increasing breathlessness and then, with a few rapid leaps, we can get to the bottom again. Thus the rhythmical pattern of copulation is reproduced in going upstairs. Nor must we omit to bring in the evidence of linguistic usage. It shows us that 'mounting' [German '*steigen*'] is used as a direct equivalent for the sexual act. We speak of a man as a '*Steiger*' [a 'mounter'] and of '*nachsteigen*' ['to run after', literally 'to climb after']. In French the steps on a staircase are called '*marches*' and '*un vieux marcheur*' has the same meaning as our '*ein alter Steiger*' ['an old rake'].[1] The dream material from which these newly recognized symbols are derived will in due time be put before you by the committee we are about to form for a collective study of symbolism. You will find some remarks on another interesting symbol, on 'rescue' and its changes in significance, in the second volume of our *Jahrbuch*.[2] But I must break off here or I shall not get to my other points.

Every one of you will know from his own experience what a very different attitude he has towards a new case of illness when once he has thoroughly grasped the structure [*Gefüge*][T] of a few typical cases. Imagine that we had arrived at a succinct formula of the factors regularly concerned in constructing [*Aufbau*] the various forms of neuroses, as we have so far succeeded in doing for the construction of hysterical symptoms [*hysterische Symptombildung*], and consider how firmly it would establish our prognostic judgement! Just as an obstetrician can tell by examining the placenta whether it has been completely expelled or whether noxious fragments of it still remain, so should we, independently of the outcome and of the patient's condition at the moment, be able to say whether our work had been definitely successful or whether we had to expect relapses and fresh onsets of illness. [144]

(*b*) I will hasten on to the innovations in the field of technique, where indeed nearly everything still awaits final settlement, and much is

1 [The whole paragraph down to this point (except for the first sentence) was reprinted as a footnote by Freud in the 1911 edition of *The Interpretation of Dreams*, *RSE*, **5**, 317 *n*. 2.]

2 [See 'A Special Type of Choice of Object' (1910*h*), below, p. 159 f. – A committee for the study of symbols was formed at the Nuremberg Congress on the suggestion of Ernest Jones, but, as he tells us (Jones, 1955, 75–6), 'little came of it later'.]

only now beginning to become clear. There are now two aims in psychoanalytic technique: to save the physician effort and to give the patient the most unrestricted access to his unconscious. As you know, our technique has undergone a fundamental transformation. At the time of the cathartic treatment what we aimed at was the elucidation of the symptoms; we then turned away from the symptoms and devoted ourselves instead to uncovering the 'complexes', to use a word which Jung has made indispensable; now, however, our work is aimed directly at finding out and overcoming the 'resistances', and we can justifiably rely on the complexes coming to light without difficulty as soon as the resistances have been recognized and removed. Some of you have since felt a need to be able to make a survey of these resistances and classify them. I will ask you to examine your material and see whether you can confirm the generalized statement that in male patients the most important resistances in the treatment seem to be derived from the father complex and to express themselves in fear of the father, in defiance of the father and in disbelief of the father.

Other innovations in technique relate to the physician himself. We have become aware of the 'countertransference' ['*Gegenübertragung*'], which arises in him as a result of the patient's influence on his
[145] unconscious feelings, and we are almost inclined to insist that he shall recognize this countertransference in himself and overcome it. Now that a considerable number of people are practising psychoanalysis and exchanging their observations with one another, we have noticed that no psychoanalyst goes further than his own complexes and internal resistances permit; and we consequently require that he shall begin his activity with a self-analysis and continually carry it deeper while he is making his observations on his patients. Anyone who fails to produce results in a self-analysis of this kind may at once give up any idea of being able to treat patients by analysis.[1]

We are also now coming to the opinion that analytic technique must be modified in certain ways according to the nature of the disease and the dominant drive [*Trieben*][T] trends in the patient. We started out from the treatment of conversion hysteria; in anxiety hysteria (phobias) we must to some extent alter our procedure. For these patients cannot bring out the material necessary for resolving their phobia so long as they feel protected by obeying the condition which it lays down. One cannot, of

1 [Freud was not always equally convinced of the possibility of adequate self-analyses for would-be analysts. He insisted later on the necessity for training analyses conducted by some other person. A fuller discussion of this can be found in an Editors' footnote to a passage in the first section of his history of the psychoanalytic movement (1914*d*), *RSE*, **14**, 17 *n*. 1.]

course, succeed in getting them to give up their protective measures and work under the influence of anxiety from the beginning of the treatment. One must therefore help them by interpreting [*Übersetzung*]^{T} their unconscious to them until they can make up their minds to do without the protection of their phobia and expose themselves to a now greatly mitigated anxiety. Only after they have done so does the material become accessible, which, when it has been mastered, leads to a solution of the phobia. Other modifications of technique, which seem to me not yet ripe for discussion, will be required in the treatment of obsessional neurosis. In this connection very important questions arise, which have not hitherto been elucidated: how far the drives which the patient is combating are to be allowed some satisfaction during the treatment, and what difference it makes whether these impulses are active (sadistic) or passive (masochistic) in their nature.[1]

I hope you will have formed an impression that, when we *know* all [146]
that we now only *suspect* and when we have carried out all the improvements in technique to which deeper observation of our patients is bound to lead us, our medical procedure will reach a degree of precision and certainty of success which is not to be found in every specialized field of medicine.

(2) I have said that we had much to expect from the increase in authority which must accrue to us as time goes on. I need not say much to you about the importance of authority. Only very few civilized people are capable of existing without reliance [*Anlehnung*]^{T} on others or are even capable of coming to an independent opinion. You cannot exaggerate the intensity of people's inner lack of resolution and craving for authority. The extraordinary increase in neuroses since the power of religions has waned may give you a measure of it.[2] The impoverishment of the ego [*Ichs*]^{T} due to the large expenditure of energy on repression [*Verdrängungsaufwand*] demanded of every individual by civilization [*Kultur*]^{T} may be one of the principal causes of this state of things.

Hitherto, this authority, with its enormous weight of suggestion, has been against us. All our therapeutic successes have been achieved in the face of this suggestion: it is surprising that any successes at all could be gained in such circumstances. I must not let myself be led into describing my agreeable experiences during the period when I alone

1 [These ideas were further developed by Freud in his Budapest Congress Paper (1919*a*), *RSE*, **17**, 159 ff.]

2 [Cf. above, pp. 111–12.]

represented psychoanalysis. I can only say that when I assured my patients that I knew how to relieve them permanently of their sufferings they looked round my modest abode, reflected on my lack of fame and title, and regarded me like the possessor of an infallible system at a gambling resort, of whom people say that if he could do what he professes he would look very different himself. Nor was it really pleasant to carry out a psychical operation while the colleagues whose duty it should have been to assist took particular pleasure in spitting into the field of operation, and while at the first signs of blood or restlessness in the patient his relatives began threatening the operating surgeon. An operation is surely entitled to produce reactions; in surgery we became
[147] accustomed to that long ago. People simply did not believe me, just as even today people do not much believe any of us. Under such conditions not a few attempts were bound to fail. To estimate the increase in our therapeutic prospects when we have received general recognition, you should think of the position of a gynaecologist in Turkey and in the West. In Turkey, all he may do is to feel the pulse of an arm stretched out to him through a hole in the wall: and his medical achievements are in proportion to the inaccessibility of their object. Our opponents in the West wish to allow us much the same degree of access to our patients' minds. But now that the force of social suggestion drives sick women to the gynaecologist, he has become their helper and saviour. I trust you will not say that the fact of the authority of society coming to our aid and increasing our successes so greatly would do nothing to prove the validity of our hypotheses – arguing as you might that, since suggestion is supposed to be able to do anything, our successes would then be successes of suggestion and not of psychoanalysis. Social suggestion is at present favourable to treating nervous patients by hydropathy, dieting and electrotherapy, but that does not enable such measures to get the better of neuroses. Time will show whether psychoanalytic treatment can accomplish more.

Now, however, I must once more dampen your expectations. Society will not be in a hurry to grant us authority. It is bound to offer us resistance, for we adopt a critical attitude towards it; we point out to it that it itself plays a great part in causing neuroses. Just as we make an individual our enemy by uncovering what is repressed in him, so society cannot respond with sympathy to a relentless exposure of its injurious effects and deficiencies. Because we destroy illusions we are accused of endangering ideals. It might seem, therefore, as though the condition from which I expect such great advantages for our therapeutic prospects will

never be fulfilled. And yet the situation is not so hopeless as one might think at the present time. Powerful though men's emotions and self-interest may be, yet intellect is a power [*Macht*]T too – a power which makes itself felt, not, it is true, immediately, but all the more certainly in the end. The harshest truths are heard and recognized at last, after the interests they have injured and the emotions they have roused have exhausted their fury. It has always been so, and the unwelcome truths [148]
which we psychoanalysts have to tell the world will have the same fate. Only it will not happen very quickly; we must be able to wait.

(3) Finally, I have to explain to you what I mean by the 'general effect' of our work, and how I come to set hopes on it. What we have here is a very remarkable therapeutic constellation, the like of which is perhaps not to be found anywhere else and which will appear strange to you too at first, until you recognize in it something you have long been familiar with. You know, of course, that the psychoneuroses are substitutive satisfactions of some drive the presence of which one is obliged to deny to oneself and others. Their capacity to exist depends on this distortion and lack of recognition. When the riddle they present is solved and the solution is accepted by the patients these diseases cease to be able to exist. There is hardly anything like this in medicine, though in fairy tales you hear of evil spirits whose power is broken as soon as you can tell them their name – the name which they have kept secret.

In place of a single sick person let us put society – suffering as a whole from neuroses, though composed of sick and healthy members; and in place of individual acceptance in the one case let us put general recognition in the other. A little reflection will then show you that this substitution cannot in any way alter the outcome. The success which the treatment can have with the individual must occur equally with the community. Sick people will not be able to let their various neuroses become known – their anxious over-tenderness which is meant to conceal their hatred, their agoraphobia which tells of disappointed ambition, their obsessive actions which represent self-reproaches for evil intentions and precautions against them – if all their relatives and every stranger from whom they wish to conceal their mental processes [*Seelenvorgänge*]T know the *Seele*
general meaning of such symptoms, and if they themselves know that in the manifestations of their illness they are producing nothing that other people cannot instantly interpret. The effect, however, will not be limited to the concealment of the symptoms – which, incidentally, it is often impossible to carry out; for this necessity for concealment destroys the

use of being ill. Disclosure of the secret will have attacked, at its most
[149] sensitive point, the 'aetiological equation' from which neuroses arise[1] – it will have made the gain from the illness illusory; and consequently the final outcome of the changed situation brought about by the physician's indiscretion can only be that the production of the illness will be brought to a stop.

If this hope seems utopian to you, you may remember that neurotic phenomena have actually been dispelled already by this means, although only in quite isolated instances. Think how common hallucinations of the Virgin Mary used to be among peasant girls in former times. So long as such a phenomenon brought a flock of believers and might lead to a chapel being built on the sacred spot, the visionary state of these girls was inaccessible to influence. Today even our clergy have changed their attitude to such things; they allow police and doctors to examine the visionary, and now the Virgin makes only very rare appearances.

Or let me examine these developments, which I have been describing as taking place in the future, in an analogous situation which is on a smaller scale and consequently easier to take in. Suppose a number of ladies and gentlemen in good society have planned to have a picnic one day at an inn in the country. The ladies have arranged among themselves that if one of them wants to relieve a natural need she will announce that she is going to pick flowers. Some malicious person, however, has got wind of this secret and has had printed on the programme which is sent round to the whole party: 'Ladies who wish to retire are requested to announce that they are going to pick flowers.' After this, of course, no lady will think of availing herself of this flowery pretext, and, in the same way, other similar formulas, which may be freshly agreed upon, will be seriously compromised. What will be the result? The ladies will admit their natural needs without shame and none of the men will object.

[150] Let us return to our more serious case. A certain number of people, faced in their lives with conflicts which they have found too difficult to solve, have taken flight into neurosis and in this way won an unmistakable, although in the long run too costly, gain from illness. What will these people have to do if their flight into illness is barred by the indiscreet revelations of psychoanalysis? They will have to be honest, confess to the drives that are at work in them, face the conflict, fight for what they want,

1 [This is a reference back to an early paper of Freud's, the second one on anxiety neurosis (1895*f*), *RSE*, **3**, 120–2. In the later part of that paper he analyses the different categories of causes operative in bringing about neuroses. He then introduces the concept of an 'aetiological equation' of several terms, each of which must be satisfied if a neurosis is to be produced. Anything that prevents any one of the terms from being satisfied will therefore have a therapeutic effect.]

or go without it; and the tolerance of society, which is bound to ensue as a result of psychoanalytic enlightenment, will help them in their task.

Let us remember, however, that our attitude to life ought not to be that of a fanatic for hygiene or therapy. We must admit that the ideal prevention of neurotic illnesses which we have in mind would not be of advantage to every individual. A good number of those who now take flight into illness would not, under the conditions we have assumed, support the conflict but would rapidly succumb or would cause a mischief greater than their own neurotic illness. Neuroses have, in fact, their biological function as a protective contrivance and they have their social justification: the 'gain from illness' they provide is not always a purely subjective one. Is there one of you who has not at some time looked into the causation of a neurosis and had to allow that it was the mildest possible outcome of the situation? And should such heavy sacrifices be made in order to eradicate the neuroses in particular, when the world is full of other unavoidable misery?

Are we, then, to abandon our efforts to explain the hidden meaning of neurosis as being in the last resort dangerous to the individual and harmful to the workings of society? Are we to give up drawing the practical conclusion from a piece of scientific insight? No; I think that in spite of this our duty lies in the other direction. The gain from illness provided by the neuroses is nevertheless on the whole and in the end detrimental to individuals as well as to society. The unhappiness that our work of enlightenment may cause will after all affect only some individuals. The changeover to a more realistic and creditable attitude on the part of society will not be bought too dearly by these sacrifices. But above all, all the energies which are today consumed in the production of neurotic symptoms serving the purposes of a world of phantasy isolated from [151]
reality will, even if they cannot at once be put to uses in life, help to strengthen the clamour for the changes in our civilization through which alone we can look for the well-being of future generations.

I should therefore like to let you go with an assurance that in treating your patients psychoanalytically you are doing your duty in more senses than one. You are not merely working in the service of science, by making use of the one and only opportunity for discovering the secrets of the neuroses; you are not only giving your patients the most efficacious remedy for their sufferings that is available today; you are contributing your share to the enlightenment of the community from which we expect to achieve the most radical prophylaxis against neurotic disorders along the indirect path of social authority.[1]

1 [The subject of 'gain from illness' was discussed at length by Freud in Lecture XXIV of his *Introductory Lectures* (1916–17*a*), *RSE*, **16**, 338–9 and *n*.]

THE ANTITHETICAL MEANING OF PRIMAL WORDS

(1910)

The present translation is a slightly revised and corrected reprint of the *SE* version.

We are told by Ernest Jones (1955, 347) that Freud came across Abel's pamphlet in the autumn of 1909. He was particularly pleased by the discovery, as is shown by the many references he made to it in his writings. In 1911, for instance, he added a footnote on it to *The Interpretation of Dreams* (1900*a*), *RSE*, **4**, 284 *n.* 1, and he summarized it at some length in two passages in his *Introductory Lectures* (1916–17*a*), Lectures XI and XV; ibid., **15**, 155–7 and 200–1. The reader should bear in mind the fact that Abel's pamphlet was published in 1884 and it would not be surprising if some of his findings were not supported by later philologists. This is especially true of his Egyptological comments, which were made before Erman had put Egyptian philology for the first time on a scientific basis. The quotations from Abel which are made here are translated without any modification in the spelling of his examples.

THE ANTITHETICAL MEANING OF PRIMAL WORDS[1]

In my *Interpretation of Dreams* I made a statement about one of the findings of my analytic work which I did not then understand. I will repeat it here by way of preface to this review: [155]

'The way in which dreams treat the category of contraries and contradictories is highly remarkable. It is simply disregarded. "No" seems not to exist so far as dreams are concerned. They show a particular preference for combining contraries into a unity or for representing them as one and the same thing. Dreams feel themselves at liberty, moreover, to represent any element by its wishful contrary; so that there is no way of deciding at first glance whether any element that admits of a contrary is present in the dream thoughts as a positive or as a negative.'[2]

The dream interpreters [*Traumdeuter*][T] of antiquity seem to have made the most extensive use of the notion that a thing in a dream can mean its opposite. This possibility has also occasionally been recognized by modern students of dreams, insofar as they concede at all that dreams have a meaning and can be interpreted.[3] Nor do I think that I shall be contradicted if I assume that all who have followed me in interpreting dreams on scientific lines have found confirmation of the statement quoted above. *Deutung*

I did not succeed in understanding the dream-work's singular tendency to disregard negation and to employ the same means of representation for expressing contraries until I happened by chance to read a work by the philologist Karl Abel, which was published in 1884 as a separate pamphlet and included in the following year in the author's *Sprachwissenschaftliche Abhandlungen* [Philological Essays]. The subject is of sufficient interest to justify my quoting here the full text of the crucial

1 [In the editions previous to 1924, the title was printed in inverted commas, and there was a subtitle which ran as follows: 'A review of a pamphlet by Karl Abel (1884) bearing the same title.']

2 *The Interpretation of Dreams* (1900*a*), *RSE*, **4**, 283–4.

3 Cf. G. H. von Schubert (1814, Chapter II).

[156] passages in Abel's paper (omitting, however, most of the examples). We obtain from them the astonishing information that the behaviour of the dream-work which I have just described is identical to a peculiarity in the oldest languages known to us.

After stressing the antiquity of the Egyptian language which must have been developed a very long time before the first hieroglyphic inscriptions, Abel goes on (1884, 4):

'Now in the Egyptian language, this sole relic of a primitive world, there are a fair number of words with two meanings, one of which is the exact opposite of the other. Let us suppose, if such an obvious piece of nonsense can be imagined, that in German the word "strong" meant both "strong" and "weak"; that in Berlin the noun "light" was used to mean both "light" and "darkness"; that one Munich citizen called beer "beer", while another used the same word to speak of water: this is what the astonishing practice amounts to which the ancient Egyptians regularly followed in their language. How could anyone be blamed for shaking his head in disbelief? . . .' (Examples omitted.)

(Ibid., 7): 'In view of these and many similar cases of antithetical meaning (see the Appendix) it is beyond doubt that in one language at least there was a large number of words that denoted at once a thing and its opposite. However astonishing it may be, we are faced with the fact and have to reckon with it.'

The author goes on to reject an explanation of these circumstances which suggests that two words might happen by chance to have the same sound, and is equally firm in repudiating an attempt to refer it to the low state of mental development in Egypt:

(Ibid., 9): 'But Egypt was anything but a home of nonsense. On the contrary, it was one of the cradles of the development of human reason. . . . It recognized a pure and dignified morality and formulated a great part of the Ten Commandments at a time when the peoples in whose hands civilization [*Zivilisation*]^{T} rests today were in the habit of slaughtering human victims as a sacrifice to bloodthirsty idols. A people that kindled the torch of justice and culture in so dark an age cannot surely have been completely stupid in everyday speech and thought. . . . Men who were able to make glass and raise and move huge [157] blocks by machinery must at least have possessed sufficient sense not to regard a thing as being simultaneously both itself and its opposite. How are we then to reconcile this with the fact that the Egyptians allowed themselves such a strangely contradictory language? . . . that they used to give one and the same phonetic vehicle to the most mutually inimical

thoughts, and used to bind together in a kind of indissoluble union things that were in the strongest opposition to each other?'

Before any explanation is attempted, mention must also be made of a further stage in this unintelligible behaviour of the Egyptian language. 'Of all the eccentricities of the Egyptian vocabulary perhaps the most extraordinary feature is that, quite apart from the words that combine antithetical meanings, it possesses other compound words in which two vocables of antithetical meanings are united so as to form a compound which bears the meaning of only one of its two constituents. Thus in this extraordinary language there are not only words meaning equally "strong" or "weak", and "command" or "obey"; but there are also compounds like "old-young", "far-near", "bind-sever", "outside-inside" . . . which, in spite of combining the extremes of difference, mean only "young", "near", "bind" and "inside" respectively . . . So that in these compound words contradictory concepts have been quite intentionally combined, not in order to produce a third concept, as occasionally happens in Chinese, but only in order to use the compound to express the meaning of one of its contradictory parts – a part which would have had the same meaning by itself . . .'

However, the riddle is easier to solve than it appears to be. Our concepts owe their existence to comparisons. 'If it were always light we should not be able to distinguish light from dark, and consequently we should not be able to have either the concept of light or the word for it . . .' 'It is clear that everything on this planet is relative and has an independent existence only insofar as it is differentiated in respect of its relations to other things . . .' 'Since every concept is in this way the twin of its contrary, how could it be first thought of and how could it be communicated to other people who were trying to conceive it, other than by being measured against its contrary . . . ?' (Ibid., 15): 'Since the concept of strength could not be formed except as a contrary to [158] weakness, the word denoting "strong" contained a simultaneous recollection of "weak", as the thing by means of which it first came into existence. In reality this word denoted neither "strong" nor "weak", but the relation and difference between the two, which created both of them equally . . .' 'Man was not in fact able to acquire his oldest and simplest concepts except as contraries to their contraries, and only learnt by degrees to separate the two sides of an antithesis and think of one without conscious comparison with the other.'

Since language serves not only to express one's own thoughts but essentially to communicate them to others the question may be raised

how it was that the 'primal Egyptian' made his neighbour understand 'which side of the twin concept he meant on any particular occasion'. In the written language this was done with the help of the so-called 'determinative' signs which, placed after the alphabetical ones, assign their meaning to them and are not themselves intended to be spoken. (Ibid., 18): 'If the Egyptian word "*ken*" is to mean "strong", its sound, which is written alphabetically, is followed by the picture of an upright-armed man; if the same word has to express "weak", the letters which represent the sound are followed by the picture of a squatting, limp figure. The majority of other words with two meanings are similarly accompanied by explanatory pictures.' Abel thinks that in speech the desired meaning of the spoken word was indicated by gesture.

According to Abel it is in the 'oldest roots' that antithetical double meanings are found to occur. In the subsequent course of the language's development this ambiguity disappeared and, in ancient Egyptian at any rate, all the intermediate stages can be followed, down to the unambiguousness of modern vocabularies. 'A word that originally bore two meanings separates in the later language into two words with single meanings, in a process whereby each of the two opposed meanings takes over a particular phonetic "reduction" (modification) of the original root.' Thus, for example, in hieroglyphics the word '*ken*', 'strong-weak', already divides into '*ken*', 'strong', and '*kan*', 'weak'. 'In other words, the concepts which could only be arrived at by means of an antithesis became in course of time sufficiently familiar to men's minds to make
[159] an independent existence possible for each of their two parts and accordingly to enable a separate phonetic representative to be formed for each part.'

Proof of the existence of contradictory primal meanings, which is easily established in Egyptian, extends, according to Abel, to the Semitic and Indo-European languages as well. 'How far this may happen in other language groups remains to be seen; for although antithesis must have been present originally to the thinking minds of every race, it need not necessarily have become recognizable or have been retained everywhere in the meanings of words.'

Abel further calls attention to the fact that the philosopher Bain, apparently without knowledge that the phenomenon actually existed, claimed this double meaning of words on purely theoretical grounds as a logical necessity. The passage in question[1] begins with these sentences:

'The essential relativity of all knowledge, thought or consciousness

1 Bain (1870, **1**, 54).

cannot but show itself in language. If everything that we can know is viewed as a transition from something else, every experience must have two sides; and either every name must have a double meaning, or else for every meaning there must be two names.'

From the 'Appendix of Examples of Egyptian, Indo-Germanic and Arabic Antithetical Meanings' I select a few instances which may impress even those of us who are not experts in philology. In Latin '*altus*' means 'high' and 'deep', '*sacer*' 'sacred' and 'accursed'; here accordingly we have the complete antithesis in meaning without any modification of the sound of the word. Phonetic alteration to distinguish contraries is illustrated by examples like '*clamare*' ('to cry') – '*clam*' ('softly', 'secretly'); '*siccus*' ('dry') – '*succus*' ('juice'). In German '*Boden*' ['garret' or 'ground'] still means the highest as well as the lowest thing in the house. Our '*bös*' ('bad') is matched by a word '*bass*' ('good'); in Old Saxon '*bat*' ('good') corresponds to the English 'bad', and the English 'to lock' to the German '*Lücke*', '*Loch*' ['hole']. We can compare the German '*kleben*' ['to stick'] with the English 'to cleave' ([in the sense of] 'to split'); the German words '*stumm*' ['dumb'] and '*Stimme*' ['voice'], and so on. In this way perhaps even the much derided derivation *lucus a non* [160] *lucendo*[1] would have some sense in it.

In his essay on 'The Origin of Language' Abel (1885, 305) calls attention to further traces of ancient difficulties in thinking. Even today the Englishman in order to express '*ohne*' says 'without' ('*mitohne*' ['with-without'] in German), and the East Prussian does the same. The word 'with' itself, which today corresponds to the German '*mit*', originally meant 'without' as well as 'with', as can be recognized from 'withdraw' and 'withhold'. The same transformation can be seen in the German '*wider*' ('against') and '*wieder*' ('together with').

For comparison with the dream-work there is another extremely strange characteristic of the ancient Egyptian language which is significant. 'In Egyptian, words can – apparently, we will say to begin with – *reverse their sound as well as their sense*. Let us suppose that the German word "*gut*" ["good"] was Egyptian: it could then mean "bad" as well as "good", and be pronounced "tug" as well as "gut". Numerous examples of such reversals of sound, which are too frequent to be explained as chance occurrences, can be produced from the Aryan and Semitic languages as well. Confining ourselves in the first instance to Germanic languages we may note: *Topf* [pot] – pot; boat – tub;

1 ['*Lucus*' (Latin for 'a grove') is said to be derived from '*lucere*' ('to shine') because it does not shine there. Quintilian (c. 35–95 A.D.), *De institutione oratoria*, I, 6.]

wait – *täuwen* [tarry]; hurry – *Ruhe* [rest]; care – reck; *Balken* [beam] – *Klobe* [log], club. If we take the other Indo-Germanic languages into consideration, the number of relevant instances grows accordingly; for example, *capere* [Latin for "take"] – *packen* [German for "seize"]; *ren* [Latin for "kidney"] – *Niere* [German for "kidney"]; leaf – *folium* [Latin for "leaf"]; *dum-a* [Russian for "thought"], *θυμός* [Greek for "spirit", "courage"] – *mêdh*, *mûdha* [Sanskrit for "mind"], *Mut* [German for "courage"]; *rauchen* [German for "to smoke"] – *Kur-ít* [Russian for "to smoke"]; *kreischen* [German for "to shriek"] – to shriek, etc.'

Abel tries to explain the phenomenon of *reversal of sound* as a doubling or reduplication of the root. Here we should find some difficulty in following the philologist. We remember in this connection how fond children are of playing at reversing the sound of words and how
[161] frequently the dream-work makes use of a reversal of the representational material for various purposes. (Here it is no longer letters but images whose order is reversed.) We should therefore be more inclined to derive reversal of sound from a factor of deeper origin.[1]

In the correspondence between the peculiarity of the dream-work mentioned at the beginning of the paper and the practice discovered by philology in the oldest languages, we may see a confirmation of the view [*Auffassung*][T] we have formed about the regressive, archaic character of the expression of thoughts in dreams. And we psychiatrists cannot escape the suspicion that we should be better at understanding and
Übersetzung translating [*übersetzen*][T] the language of dreams if we knew more about the development of language.[2]

1 For the phenomenon of reversal of sound (metathesis), which is perhaps even more intimately related to the dream-work than are contradictory meanings (antithesis), compare also Meyer-Rinteln (1909).

2 It is plausible to suppose, too, that the original antithetical meaning of words exhibits the ready-made mechanism which is exploited for various purposes by slips of the tongue that result in the opposite being said [of what was consciously intended].

Research by Grubrich-Simitis (1993, 211; trans., 165, slightly modified here) reveals that Freud had initially entitled this paper 'A Frequent Type of Object Choice Made by Men' ('Über einen häufigen Typus der Objektwa[h]l beim Manne').

The present translation is a slightly revised and corrected reprint of the *SE* version.

This and the two following papers, though they were written and published over a period of some years, were brought together by Freud in the fourth series of his shorter papers (*SKSN*, **4**, 1918) under the collective title printed above. We learn from Ernest Jones (1955, 333) that Freud had announced his intention of writing some such work at a meeting of the Vienna Psychoanalytical Society on November 28, 1906. The gist of the present paper was given before the same Society on May 19, 1909, and discussed a week later. But it was not actually written until the early summer of the following year.

A SPECIAL TYPE OF CHOICE OF OBJECT MADE BY MEN

(CONTRIBUTIONS TO THE PSYCHOLOGY OF LOVE I)[t]

Up till now we have left it to the creative writer [*Dichtern*] to depict for us the 'necessary conditions for loving' which govern people's choice of an object, and the way in which they bring the demands of their imagination [*Phantasie*][T] into harmony with reality. The writer can indeed draw on certain qualities which fit him to carry out such a task: above all, on a sensitivity that enables him to perceive the hidden impulses in the minds [*Seelenregungen*][T] of other people, and the courage to let his own unconscious speak. But there is one circumstance which lessens the evidential value of what he has to say. Writers are under the necessity to produce intellectual and aesthetic pleasure [*Lust*][T], as well as certain emotional effects. For this reason they cannot reproduce the stuff of reality unchanged, but must isolate portions of it, remove disturbing associations [*Zusammenhänge*][t], tone down the whole and fill in what is missing. These are the privileges of what is known as 'poetic licence'. Moreover, they can show only slight interest in the origin and development of the mental [*seelischer*][T] states which they portray in their completed form. In consequence it becomes inevitable that science should concern itself with the same materials whose treatment by artists has given enjoyment to mankind for thousands of years, though her touch must be clumsier and the yield of pleasure less. These observations will, it may be hoped, serve to justify us in extending a strictly scientific treatment to the field of human love. Science is, after all, the most complete renunciation of the pleasure principle of which our mental activity is capable. [165] *Regung* *Seele*

In the course of psychoanalytic treatment there are ample opportunities for collecting impressions of the way in which neurotics behave in love; while at the same time we can recall having observed or heard of similar behaviour in people of average health or even in those with outstanding

qualities. When the material happens to be favourable and thus leads to
[166] an accumulation of such impressions, distinct types emerge more clearly. I will begin here with a description of one such type of object choice – which occurs in men – since it is characterized by a number of 'necessary conditions for loving' whose combination is unintelligible, and indeed bewildering, and since it admits of a simple explanation on psychoanalytic lines.

(1) The first of these preconditions for loving can be described as positively specific: wherever it is found, the presence of the other characteristics of this type may be looked for. It may be termed the precondition that there should be 'an injured third party'; it stipulates that the person in question shall never choose as his love object a woman who is disengaged – that is, an unmarried girl or an unattached married woman – but only one to whom another man can claim right of possession as her husband, fiancé or friend. In some cases this precondition proves so cogent that a woman can be ignored, or even rejected, so long as she does not belong to any man, but becomes the object of passionate feelings immediately she comes into one of these relationships with another man.

(2) The second precondition is perhaps a less constant one, but it is no less striking. It has to be found in conjunction with the first for the type to be realized, whereas the first precondition seems very often to occur independently as well. This second precondition is to the effect that a woman who is chaste and whose reputation is irreproachable never exercises an attraction that might raise her to the status of a love object, but only a woman who is in some way or other of bad repute sexually, whose fidelity and reliability are open to some doubt. This latter characteristic may vary within substantial limits, from the faint breath of scandal attaching to a married woman who is not averse to a flirtation up to the openly promiscuous way of life of a *cocotte* or of an adept in the art of love; but the men who belong to our type will not be satisfied without something of the kind. This second necessary condition may be termed, rather crudely, 'love for a whore'.

While the first precondition provides an opportunity for gratifying impulses of rivalry and hostility directed at the man from whom the loved woman is wrested, the second one, that of the woman's being like
[167] a whore, is connected with the experiencing of *jealousy*, which appears to be a necessity for lovers of this type. It is only when they are able to be jealous that their passion reaches its height and the woman acquires her full value, and they never fail to seize on an occasion that allows them to

experience these most powerful emotions. What is strange is that it is not the lawful possessor of the loved one who becomes the target of this jealousy, but strangers, making their appearance for the first time, in relation to whom the loved one can be brought under suspicion. In glaring instances the lover shows no wish for exclusive possession of the woman and seems to be perfectly comfortable in the triangular situation. One of my patients, who had been made to suffer terribly by his lady's escapades, had no objection to her getting married, and did all he could to bring it about; in the years that followed he never showed a trace of jealousy towards her husband. Another typical patient had, it is true, been very jealous of the husband in his first love affair, and had forced the lady to stop having marital relations; but in his numerous subsequent affairs he behaved like the other members of this type and no longer regarded the lawful husband as an interference.

So much for the conditions required in the love object. The following points describe the lover's behaviour towards the object he has chosen.

(3) In normal love the woman's value is measured by her sexual integrity, and is reduced by any approach to the characteristic of being like a whore.[1] Hence the fact that women with this characteristic are considered by men of our type to be *love objects of the highest value* seems to be a striking departure from the normal. Their love relationships with these women are carried on with the highest expenditure of mental energy, to the exclusion of all other interests; they are felt as the only people whom it is possible to love, and the demand for fidelity which the lover makes upon himself is repeated again and again, however often it may be broken in reality. These features of the love relationships which I am here describing show their *compulsive* nature very clearly, though [168]
that is something which is found up to a certain degree whenever anyone falls in love. But the fidelity and intensity that mark the attachment must not lead one to expect that a single love relationship of this kind will make up the whole erotic life of the person in question or occur only once in it. On the contrary, passionate attachments of this sort are repeated with the same peculiarities – each an exact replica of the others – again and again in the lives of men of this type; in fact, owing to external events such as changes of residence and environment, the love objects may replace one another so frequently that a *long series of them is formed*.

1 [The German '*Dirne*' was translated 'prostitute' in the *SE*. However, here and in several other passages in this paper, it is not well rendered by this term, which in English lays too much stress on the monetary side of the relation. 'Harlot' would perhaps give the sense better, if the word had not today acquired an antiquated and even biblical colouring. 'Whore' seems to fit best with modern usage.]

(4) What is most startling of all to the observer in lovers of this type is the urge they show to '*rescue*' the woman they love. The man is convinced that she is in need of him, that without him she would lose all moral control and rapidly sink to a lamentable level. He rescues her, therefore, by not giving her up. In some individual cases the idea of having to rescue her can be justified by reference to her sexual unreliability and the dangers of her social position: but it is no less conspicuous where there is no such basis in reality. One man of the type I am describing, who knew how to win his ladies by clever methods of seduction and subtle arguments, spared no efforts in the subsequent course of these affairs to keep the woman he was for the time being in love with on the path of 'virtue' by presenting her with tracts of his own composition.

If we survey the different features of the picture presented here – the conditions imposed on the man that his loved one should not be unattached and should be like a whore, the high value he sets on her, his need for feeling jealousy, his fidelity, which is nevertheless compatible with being broken down into a long series of instances, and the urge to rescue the woman – it will seem scarcely probable that they should all be derived from a single source. Yet psychoanalytic exploration into the life histories of men of this type has no difficulty in showing that there is such a single source. The object choice which is so strangely conditioned, and this very singular way of behaving in love, have the same psychical origin as we find in the loves of normal people. They are derived from the infant-
[169] ile fixation of tender feelings on the mother, and represent one of the consequences of that fixation. In normal love only a few characteristics which reveal unmistakably the maternal prototype of the object choice survive, as, for instance, the preference shown by young men for maturer women; the detachment of libido from the mother has been effected relatively swiftly. In our type, on the other hand, the libido has remained attached to the mother for so long, even after the onset of puberty, that the maternal characteristics remain stamped on the love objects that are chosen later, and all these turn into easily recognizable mother surrogates. The comparison with the way in which the skull of a newly born child is shaped[1] springs to mind at this point: after a protracted labour it always takes the form of a cast of the narrow part of the mother's pelvis.

1 [In the editions before 1924 this read 'deformed'.]

We have now to show the plausibility of our assertion that the characteristic features of our type – its conditions for loving and its behaviour in love – do in fact arise from the psychical constellation connected with the mother. This would seem to be easiest where the first precondition is concerned – the condition that the woman should not be unattached, or that there should be an injured third party. It is at once clear that for the child who is growing up in the family circle the fact of the mother belonging to the father becomes an inseparable part of the mother's essence, and that the injured third party is none other than the father himself. The trait of overvaluing the loved one, and regarding her as unique and irreplaceable, can be seen to fall just as naturally into the context of the child's experience, for no-one possesses more than one mother, and the relation to her is based on an event that is not open to any doubt and cannot be repeated.

If we are to understand the love objects chosen by our type as being above all mother surrogates, then the formation of a series of them, which seems so flatly to contradict the condition of being faithful to one, can now also be understood. We have learnt from psychoanalysis in other examples that the notion of something irreplaceable, when it is active in the unconscious, frequently appears as broken up into an endless series: endless for the reason that every surrogate nevertheless fails to provide the desired satisfaction. This is the explanation of the insatiable urge to ask questions shown by children at a certain age: they [170] have one single question to ask, but it never crosses their lips.[1] It explains, too, the garrulity of some people affected by neurosis; they are under the pressure of a secret which is burning to be disclosed but which, despite all temptation, they never reveal.

On the other hand, the second precondition for loving – the condition that the object chosen should be like a whore – seems energetically to oppose a derivation from the mother complex. The adult's conscious thought likes to regard his mother as a person of unimpeachable moral purity; and there are few ideas which he finds so offensive when they come from others, or feels as so tormenting when they spring from his own mind, as one which calls this aspect of his mother in question. This very relation of the sharpest contrast between 'mother' and 'whore' will, however, encourage us to enquire into the history of the development of these two complexes and the unconscious relation between them, since we long ago discovered that what, in the conscious, is found

1 [This point is also made by Freud in his essay on Leonardo da Vinci (1910*c*), above, p. 74.]

split into a pair of opposites often occurs in the unconscious as a unity.[1] Investigation then leads us back to the time in a boy's life at which he first gains a more or less complete knowledge of the sexual relations between adults, somewhere about the years of prepuberty. Brutal pieces of information, which are undisguisedly intended to arouse contempt and rebelliousness, now acquaint him with the secret of sexual life and destroy the authority of adults, which appears incompatible with the revelation of their sexual activities. The aspect of these disclosures which affects the newly initiated child most strongly is the way in which they apply to his own parents. This application is often flatly rejected by him, in some such words as these: '*Your* parents and other people may do something like that with one another, but *my* parents can't possibly do it.'[2]

[171] As an almost invariable corollary to this 'sexual enlightenment', the boy at the same time gains a knowledge of the existence of certain women *Geschlecht* who practise sexual [*geschlechtlichen*][T] intercourse as a means of livelihood, and who are for this reason held in general contempt. The boy himself is necessarily far from feeling this contempt: as soon as he learns that he too can be initiated by these unfortunates into sexual life [*Geschlechtsleben*], which till then he accepted as being reserved exclusively for 'grown-ups', he regards them only with a mixture of longing and horror. When after this he can no longer maintain the doubt which makes his parents an exception to the universal and odious norms of sexual activity, he tells himself with cynical logic that the difference between his mother and a whore [*Hure*] is not after all so very great, since basically they do the same thing. The enlightening information he has received has, in fact, awakened the memory traces of the impressions and wishes of his early infancy, and these have led to a reactivation in him of certain mental impulses. He begins to desire his mother herself in the sense with which he has recently become acquainted, and to hate his father anew as a rival who stands in the way of this wish; he comes, as we say, under the dominance of the Oedipus complex.[3] He does not forgive his mother for having granted the favour of sexual [*sexuellen*]

1 [This fact had already been hinted at in Freud's *Interpretation of Dreams* (1900*a*), *RSE*, **4**, 283–4, and explicitly mentioned in Chapter VI of his book on *Jokes* (1905*c*), ibid., **8**, 151–2. See also above, p. 143 ff.]

2 [Cf. the last paragraph of Freud's paper on the sexual theories of children (1908*c*), *RSE*, **9**, 196.]

3 [This appears to be Freud's first published use of the actual term. The concept had, of course, long been familiar to him (cf. ibid., **4**, 233–4 *n.* 2), and he had already spoken of the 'nuclear complex', e.g. in the paper referred to in footnote 2 above (*RSE*, **9**, 187), and in his *Five Lectures* (1910*a*), above, p. 45.]

intercourse not to himself but to his father, and he regards it as an act of unfaithfulness. If these impulses do not quickly pass, there is no outlet for them other than to run their course in phantasies which have as their subject his mother's sexual activities under the most diverse circumstances; and the consequent tension leads particularly readily to his finding relief in masturbation. As a result of the constant combined operation of the two driving forces [*treibenden Motive*][T], desire and thirst for revenge, phantasies of his mother's unfaithfulness are by far the most preferred; the lover with whom she commits her act of infidelity almost always exhibits the features of the boy's own ego [*Ichs*][T], or more accurately, of his own idealized personality, grown up and so raised to a level with his father. What I have elsewhere[1] described as the 'family romance' comprises the manifold ramifications of this imaginative activity and the way in which they are interwoven with various egoistic [*egoistischen*] interests of this period of life.

Trieb, Motiv

[172]

Now that we have gained an insight into this piece of mental development we can no longer regard it as contradictory and incomprehensible that the precondition of the loved one's being like a whore should derive directly from the mother complex. The type of male love which we have described bears the traces of this evolution and is simple to understand as a fixation on the phantasies formed by the boy in puberty – phantasies which have later after all found a way out into real life. There is no difficulty in assuming that the masturbation assiduously practised in the years of puberty has played its part in the fixation of the phantasies.

To these phantasies which have succeeded in dominating the man's love in real life, the urge to *rescue* the loved one seems to bear merely a loose and superficial relation, and one that is fully accounted for by conscious reasons. By her propensity to be fickle and unfaithful the loved one brings herself into dangerous situations, and thus it is understandable that the lover should be at pains to protect her from these dangers by watching over her virtue and counteracting her bad inclinations. However, the study of people's screen memories [*Deckerinnerungen*][T], phantasies and nocturnal dreams shows that we have here a particularly felicitous 'rationalization' of an unconscious motive, a process which may be compared to a successful secondary revision of a dream. In actual fact the 'rescue motif' has a meaning and history of its own, and is an independent derivative of the mother complex, or more accurately, of the parental complex. When a child hears that he *owes his*

1 In [a discussion included in] Rank's *The Myth of the Birth of the Hero* (1909) [Freud (1909*c*), *RSE*, **9**, 211 ff.].

life to his parents, or that his mother *gave him life*, his feelings of tenderness unite with impulses which strive for power and independence, and they generate the wish to return this gift to the parents and to repay them with one of equal value. It is as though the boy's defiance were to make him say: 'I want nothing from my father; I will give him back all I have cost him.' He then forms the phantasy of *rescuing his father from danger and saving his life*; in this way he puts his account square with him. This phantasy is commonly enough displaced [*verschiebt*][T] on to the emperor, king or some other great man; after being thus distorted it becomes admissible to consciousness, and may even be made use of by creative writers. In its application to a boy's father it is the defiant meaning in the idea of rescuing which is by far the most important; where his mother is concerned it is usually its tender meaning. The mother gave the child life, and it is not easy to find a substitute of equal value for this unique gift. With a slight change of meaning, such as is easily effected in the unconscious and is comparable to the way in which in consciousness concepts shade into one another, rescuing his mother takes on the significance of giving her a child or making a child for her – needless to say, one like himself. This is not too remote from the original sense of rescuing, and the change in meaning is not an arbitrary one. His mother gave him a life – his own life – and in exchange he gives her another life, that of a child which has the greatest resemblance to himself. The son shows his gratitude by wishing to have by his mother a son who is like himself: in other words, in the rescue phantasy he is completely identifying himself with his father. All his drives, those to tenderness, gratitude, lustfulness, defiance and independence, find satisfaction in the single wish *to be his own father*. Even the element of danger has not been lost in the change of meaning; for the act of birth itself is the danger from which he was saved by his mother's efforts. Birth is both the first of all dangers to life and the prototype of all the later ones that cause us to feel anxiety [*Angst*][T], and the experience of birth has probably left behind in us the expression of affect which we call anxiety. Macduff of the Scottish legend, who was not born of his mother but ripped from her womb, was for that reason unacquainted with anxiety.[1]

Verschiebung
[173]

1 [*Macbeth*, Act V, Scene 7. This is Freud's first extended allusion to the relation between birth and anxiety. He had already referred to the question in a footnote added in the previous year (1909) to Chapter VI (E) of *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 358 *n.* 2, and had mentioned it in a discussion at the Vienna Psychoanalytical Society on November 17, 1909 (Jones, 1955, 494). He dealt with it again at some length near the beginning of Lecture XXV of the *Introductory Lectures* (1916–17*a*), *RSE*, **16**, 350–1. But his longest discussion of it can, of course, be found in *Inhibitions, Symptoms and Anxiety* (1926*d*), especially in Chapters II, VIII and XI, A (*b*), where his former opinions are largely revised. At the beginning of his psychological studies Freud

Artemidorus, the dream interpreter of antiquity, was certainly right in [174]
maintaining that the meaning of a dream depends on who the dreamer happens to be.[1] Under the laws governing the expression of unconscious thoughts, the meaning of rescuing may vary, depending on whether the author of the phantasy is a man or a woman. It can equally mean (in a man) making a child, i.e. causing it to be born, or (in a woman) giving birth oneself to a child. These various meanings of rescuing in dreams and phantasies can be recognized particularly clearly when they are found in connection with water. A man rescuing a woman from the water in a dream means that he makes her a mother, which in the light of the preceding discussion amounts to making her his own mother. A woman rescuing someone else (a child) from the water acknowledges herself in this way as the mother who bore him, like Pharaoh's daughter in the legend of Moses (Rank, 1909). At times there is also a tender meaning contained in rescue phantasies directed towards the father. In such cases they aim at expressing the subject's wish to have his father as a son – that is, to have a son who is like his father.[2]

It is on account of all these connections between the rescue motif and the parental complex that the urge to rescue the loved one forms an important feature of the type of loving which I have been discussing.

I do not feel that it is necessary for me to justify my method of work on this subject; as in my presentation of anal erotism [Freud (1908*b*), *RSE*, **9**], so here too I have in the first place aimed at singling out from the observational material extreme and sharply defined types. In both cases we find a far greater number of individuals in whom only a few features of the type can be recognized, or only features which are not distinctly marked, and it is obvious that a proper appreciation of these types will [175]
not be possible until the whole context to which they belong has been explored.[3]

had connected the symptoms of anxiety not with the experience of birth, but with the accompaniments of copulation. Cf. the penultimate paragraph of Section III of his first paper on anxiety neurosis (1895*b*), ibid., **3**, 100, and a passage near the end of the probably even earlier Draft E in the Fliess correspondence (Freud, 1950*a*).]

1 [Cf. a passage in Chapter II of *The Interpretation of Dreams* (1900*a*), *RSE*, **4**, 88, and a footnote to it added in 1914.]

2 [Dreams of rescuing are mentioned in a paragraph added in 1911 to Chapter VI (E) of *The Interpretation of Dreams*, ibid., **5**, 361. A woman's rescue dream is analysed in Freud's paper on 'Dreams and Telepathy' (1922*a*), ibid., **18**, 203 ff.]

3 [In a paper (1920*a*) written many years after the present one, Freud demonstrated the occurrence of precisely the same type of object choice in a homosexual girl, ibid., **18**, 151 f.]

The present translation is a revised and corrected reprint of the *SE* version.

The discussion of the two sexual currents in the earlier part of the present paper is in effect a supplement to the *Three Essays on the Theory of Sexuality* (1905*d*), in the 1915 edition of which, indeed, a short summary of it was included (*RSE*, **7**, 177). The analysis of psychical impotence, which occupies the central section of the paper, is Freud's principal contribution to that topic. The last part of the paper is one of the long series of his elaborations of the theme of the antagonism between civilization and the drives, another instance of which appears in his *Five Lectures*, p. 51 f. above.

His fullest arguments on the subject can be found in the paper on '"Civilized" Sexual Morality and Modern Nervous Illness' (1908*d*), *RSE*, **9**, and in the very much later *Civilization and its Discontents* (1930*a*), ibid., **21**.

ON THE UNIVERSAL TENDENCY TO DEBASEMENT IN THE SPHERE OF LOVE

(CONTRIBUTIONS TO THE PSYCHOLOGY OF LOVE II)[t]

I

If the practising psychoanalyst asks himself on account of what disorder people most often come to him for help, he is bound to reply – disregarding the many forms of anxiety [*Angst*][T] – that it is psychical impotence. This singular disturbance affects men of strongly libidinous[I] natures, and manifests itself in a refusal by the executive organs of sexuality [*Sexualität*] to carry out the sexual [*geschlechtlichen*][T] act, although before and after they may show themselves to be intact and capable of performing the act, and although a strong psychical inclination to carry it out is present. The first clue to understanding his condition is obtained by the sufferer himself on making the discovery that a failure [*Versagen*][T] of this kind arises only when the attempt is made with certain individuals; whereas with others there is never any question of such a failure. He now becomes aware that it is some feature of the sexual object which gives rise to the inhibition of his male potency, and sometimes he reports that he has a feeling of an obstacle inside him, the sensation of a counter-will which successfully interferes with his conscious intention. However, he is unable to guess what this internal obstacle is and what feature of the sexual object brings it into operation. If he has had repeated experience of a failure of this kind, he is likely, by the familiar process of 'erroneous connection',[2] to decide that the recollection of the first occasion evoked the disturbing anxiety idea [*Angstvorstellung*][T] and so caused the failure to be repeated each time; while he derives the first occasion itself from some 'accidental' impression.

1 ['*libidinös*.' Here 'libidinous', as contrasted with the technical 'libidinal'.]

2 ['*fehlerhafter Verknüpfung*.' This seems to be an allusion to the slightly differently termed 'false connection' already described in *Studies on Hysteria* (1895*d*), *RSE*, **2**, 60 f. *n*.]

[180] Psychoanalytic studies of psychical impotence have already been carried out and published by several writers.[1] Every analyst can confirm the explanations provided by them from his own clinical experience. It is in
Hemmung fact a question of the inhibitory [*hemmende*]^{T} influence of certain psychical complexes which are withdrawn from the subject's knowledge. An incestuous fixation on mother or sister, which has never been surmounted, plays a prominent part in this pathogenic material and is its most universal content. In addition there is the influence to be considered of accidental distressing impressions connected with infantile sexual activity, and also those factors which in a general way reduce the libido that is to be directed on to the female sexual object.[2]

When striking cases of psychical impotence are exhaustively investigated by means of psychoanalysis, the following information is obtained about the psychosexual processes at work in them. Here again – as very probably in all neurotic disturbances – the foundation of the disorder is provided by an inhibition in the developmental history of the libido before it assumes the form which we take to be its normal termination. Two currents whose union is necessary to ensure a completely normal attitude in love have, in the cases we are considering, failed to combine. These two may be distinguished as the *affectionate* [*zärtliche*] and the *sensual* [*sinnliche*] current.

The affectionate current is the older of the two. It springs from the
Selbsterhaltung, *Trieb* earliest years of childhood; it is formed on the basis of the interests of the self-preservative drive [*Selbsterhaltungstriebes*]^{T} and is directed to the members of the family and those who look after the child. From the very beginning it carries along with it contributions from the sexual drives – components of erotic interest – which can already be seen more or less clearly even in childhood and in any event are uncovered in neurotics by psychoanalysis later on. It corresponds to *the child's primary object choice*. We learn in this way that the sexual drives find their first objects by attaching [*in der Anlehnung*]^{T} themselves to the
Ich valuations made by the ego drives [*Ichtriebe*]^{T}, precisely in the way in
[181] which the first sexual satisfactions are experienced in attachment [*in Anlehnung*] to the bodily functions necessary for the preservation of life.[3] The 'affection' shown by the child's parents and those who look after him, which seldom fails to betray its erotic nature ('the child is an

1 Steiner (1907), Stekel (1908), Ferenczi (1908). [Freud had written a Preface to Stekel's book (Freud, 1908*f*), *RSE*, **9**, and wrote one later to a book of Steiner's (1913) on the same subject (Freud, 1913*e*), ibid., **12**.]

2 Stekel (1908, 191 ff.).

3 [The 'attachment' (or 'anaclitic') type of object choice was discussed more fully in Freud's later paper on narcissism (1914*c*), *RSE*, **14**, 75 ff.]

erotic plaything'), does a very great deal to raise the contributions made by erotism to the cathexes [*Besetzungen*]^{T} of his ego drives, and to increase them to an amount which is bound to play a part in his later development, especially when certain other circumstances lend their support.

These affectionate fixations of the child persist throughout childhood, and continually carry along with them erotism, which is consequently diverted from its sexual aims. Then at the age of puberty they are joined by the powerful 'sensual' current which no longer mistakes its aims. It never fails, apparently, to follow the earlier paths and to cathect the objects of the primary infantile choice with quotas of libido that are now far stronger. Here, however, it runs up against the obstacles that have been erected in the meantime by the barrier against incest; consequently it will make efforts to pass on from these objects which are unsuitable in reality, and find a way as soon as possible to other, extraneous objects with which a real sexual life may be carried on. These new objects will still be chosen on the model (imago)[1] of the infantile ones, but in the course of time they will attract to themselves the affection that was tied to the earlier ones. A man shall leave his father and his mother – according to the biblical command[2] – and shall cleave unto his wife; affection and sensuality are then united. The greatest intensity of sensual passion will bring with it the highest psychical valuation of the object – this being the normal overvaluation of the sexual object on the part of a man.

Two factors will decide whether this advance in the developmental path of the libido is to fail. First, there is the amount of *frustration* [*Versagung*]^{T} *in reality* which opposes the new object choice and reduces its value for the person concerned. There is after all no point in embarking upon an object choice if no choice is to be allowed at all or if there is no prospect of being able to choose anything suitable. Secondly, there is the amount of *attraction* which the infantile objects that have to be [182]
relinquished are able to exercise, and which is in proportion to the erotic cathexis attaching to them in childhood. If these two factors are sufficiently strong, the general mechanism by which the neuroses are formed comes into operation. The libido turns away from reality, is taken over by imaginative activity [*Phantasietätigkeit*]^{T} (the process of *Phantasie*
introversion), strengthens the images of the first sexual objects and becomes fixated [*fixiert*]^{T} to them. The obstacle raised against incest, *Fixierung*

1 [On the use of the term 'imago', cf. an Editors' footnote to the paper on masochism (1924*c*), *RSE*, **19**, 159 *n.* 3.]

2 [*Genesis* ii, 24.]

however, compels the libido that has turned to these objects to remain in the unconscious. The masturbatory activity carried out by the sensual current, which is now part of the unconscious, makes its own contribution in strengthening this fixation. Nothing is altered in this state of affairs if the advance which has miscarried in reality is now completed in phantasy, and if in the phantasy situations that lead to masturbatory satisfaction the original sexual objects are replaced by different ones. As a result of this substitution the phantasies become admissible to consciousness, but no progress is made in the allocation of the libido in reality. In this way it can happen that the whole of a young man's sensuality becomes tied to incestuous objects in the unconscious,[1] or to put it another way, becomes fixated to unconscious incestuous phantasies. The result is then total impotence, which is perhaps further ensured by the simultaneous onset of an actual weakening of the organs that perform the sexual act.

Less severe conditions are required to bring about the state known specifically as psychical impotence. Here the fate of the sensual current must not be that its whole charge has to conceal itself behind the affectionate current; it must have remained sufficiently strong or uninhibited to secure a partial outlet into reality. The sexual activity of such people shows the clearest signs, however, that it does not have the whole psychical driving force [*Triebkraft*] behind it. It is capricious, easily disturbed, often not properly carried out, and not accompanied by much pleasure. But above all it is forced to avoid the affectionate current. A restriction has thus been placed on object choice. The sensual current that has remained active seeks only objects which do not recall the incestuous
[183] figures forbidden to it; if someone makes an impression that might lead to a high psychical estimation of her, this impression does not find an issue in any sensual excitation but in affection which has no erotic effect. The whole sphere of love in such people remains divided in the two directions personified in art as sacred and profane (or animal) love. Where they love they do not desire and where they desire they cannot love. They seek objects which they do not need to love, in order to keep their sensuality away from the objects they love; and, in accordance with the laws of 'complexive sensitiveness'[2] and of the return of the repressed
Verdrängung [*Rückkehr des Verdrängten*][T], the strange failure shown in psychical impotence makes its appearance whenever an object which has been

1 [In the editions before 1924 the word used here is the very unusual '*Unbewusstsein*', 'unconsciousness'.]

2 [This term is borrowed from Jung's word-association experiments (Jung, 1906, 1909), and is also used by Freud in the 'Rat Man' case history (1909*d*), *RSE*, **10**, 160.]

chosen with the aim of avoiding incest recalls the prohibited object through some feature, often an inconspicuous one.

The main protective measure against such a disturbance which men have recourse to in this split in their love consists in a psychical *debasement* of the sexual object, the overvaluation that normally attaches to the sexual object being reserved for the incestuous object and its representatives. As soon as the condition of debasement is fulfilled, sensuality can be freely expressed, and important sexual capacities and a high degree of pleasure can develop. There is a further factor which contributes to this result. People in whom there has not been a proper confluence of the affectionate and the sensual currents do not usually show much refinement in their modes of behaviour in love; they have retained perverse sexual aims whose non-fulfilment is felt as a serious loss of pleasure, and whose fulfilment, on the other hand, seems possible only with a debased and despised sexual object.

We can now understand the motives behind the boy's phantasies mentioned in the first of these 'Contributions' (above, pp. 158–9), which degrade the mother to the level of a whore. They are efforts to bridge the gulf between the two currents in love, at any rate in phantasy, and by debasing the mother to acquire her as an object of sensuality.

2

In the preceding section we have approached the study of psychical impotence from a medico-psychological angle of which the title of this paper gives no indication. It will, however, become clear that this introduction was required by us to provide an approach to our proper subject. [184]

We have reduced psychical impotence to the failure of the affectionate and the sensual currents in love to combine, and this developmental inhibition has in turn been explained as being due to the influences of strong childhood fixations and of later frustration in reality through the intervention of the barrier against incest. There is one principal objection to the theory we advance; it does too much. It explains why certain people suffer from psychical impotence, but it leaves us with the apparent mystery of how others have been able to escape this disorder. Since we must recognize that all the relevant factors known to us – the strong childhood fixation, the incest barrier and the frustration in the years of development after puberty – are to be found in practically all civilized human beings [*Kulturmenschen*][T], we should be justified in *Kultur*

expecting psychical impotence to be a universal affliction under civilization and not a disorder confined to some individuals.

It would be easy to escape from this conclusion by pointing to the quantitative factor in the causation of illness – to the greater or lesser extent of the contribution made by the various elements which determine whether or not a recognizable illness results. But although I accept this answer as correct, it is not my intention to make it a reason for rejecting the conclusion itself. On the contrary, I shall put forward the view that psychical impotence is much more widespread than is supposed, and that a certain amount of this behaviour does, in fact, characterize the love of civilized man.

If the concept of psychical impotence is broadened and is not restricted to failure to perform the act of coitus in circumstances where a desire to obtain pleasure is present and the genital apparatus is intact, we may in the first place add all those men who are described as psychanaesthetic: men who never fail in the act but who carry it out without getting any particular pleasure from it – a state of affairs that is
[185] more common than one would think. Psychoanalytic examination of such cases discloses the same aetiological factors as we found in psychical impotence in the narrower sense, without at first arriving at any explanation of the difference between their symptoms. An easily justifiable analogy takes one from these anaesthetic men to the immense number of frigid women; and there is no better way to describe or understand their behaviour in love than by comparing it with the more conspicuous disorder of psychical impotence in men.[1]

If, however, we turn our attention not to an extension of the concept of psychical impotence, but to the gradations in its symptomatology, we cannot escape the conclusion that the behaviour in love of men in the civilized world today bears the stamp altogether of psychical impotence. There are only a very few educated people in whom the two currents of affection and sensuality have become properly fused; the man almost always feels his respect for the woman acting as a restriction on his sexual activity, and develops full potency only when he is with a debased sexual object; and this in its turn is partly caused by the entrance of perverse components into his sexual aims, which he does not venture to satisfy with a woman he respects. He is assured of complete sexual pleasure only when he can devote himself unreservedly to obtaining satisfaction,

1 I am at the same time very willing to admit that frigidity in women is a complex subject which can also be approached from another angle. [The question is examined at length in 'The Taboo of Virginity' (1918*a*), p. 190 ff. below.]

which with his well-brought-up wife, for instance, he does not dare to do. This is the source of his need for a debased sexual object, a woman who is ethically inferior, to whom he need attribute no aesthetic scruples, who does not know him in his other social relations and cannot judge him in them. It is to such a woman that he prefers to devote his sexual potency, even when the whole of his affection belongs to a woman of a higher kind. It is possible, too, that the tendency so often observed in men of the highest classes of society to choose a woman of a lower class as a permanent mistress or even as a wife is nothing but a consequence of their need for a debased sexual object, to whom, psychologically, the possibility of complete satisfaction is linked.

I do not hesitate to make the two factors at work in psychical impotence in the strict sense – the factors of intense incestuous fixation in childhood and the frustration by reality in adolescence – responsible, too, for this extremely common characteristic of the love of civilized men. It sounds not only disagreeable but also paradoxical, yet it must nevertheless be said that anyone who is to be really free and happy in love must have surmounted his respect for women and have come to terms with the idea of incest with his mother or sister. Anyone who subjects himself to a serious self-examination on the subject of this requirement will be sure to find that he regards the sexual act basically as something degrading, which defiles and pollutes not only the body. The origin of this low opinion, which he will certainly not willingly acknowledge, must be looked for in the period of his youth in which the sensual current in him was already strongly developed but its satisfaction with an object outside the family was almost as completely prohibited as it was with an incestuous one. [186]

In our civilized world women are under the influence of a similar after-effect [*Nachwirkung*][T] of their upbringing, and, in addition, of their reaction to men's behaviour. It is naturally just as unfavourable for a woman if a man approaches her without his full potency as it is if his initial overvaluation of her when he is in love gives places to undervaluation after he has possessed her. In the case of women there is little sign of a need to debase their sexual object. This is no doubt connected with the absence in them as a rule of anything similar to the sexual overvaluation found in men. But their long holding back from sexuality and the lingering of their sensuality in phantasy has another important consequence for them. They are subsequently often unable to undo the connection between sensual activity and the prohibition, and prove to be psychically impotent, that is, frigid, when such activity is at last allowed *Nachträglichkeit*

them. This is the origin of the endeavour made by many women to keep even legitimate relations secret for a while; and of the capacity of other women for normal sensation as soon as the condition of prohibition is re-established by a secret love affair: unfaithful to their husband, they are able to keep a second order of faith with their lover [cf. p. 192 below].

[187] The condition of forbiddenness in the erotic life of women is, I think, comparable to the need on the part of men to debase their sexual object. Both are consequences of the long period of delay, which is demanded by education [*Erziehung*]^{T} for cultural reasons, between sexual maturity *Geschlecht* [*Geschlechtsreife*]^{T} and sexual activity [*Sexualbetätigung*]. Both aim at abolishing the psychical impotence that results from the failure of affectionate and sensual impulses to coalesce. That the effect of the same causes should be so different in men and in women may perhaps be traced to another difference in the behaviour of the two sexes. Civilized women do not usually transgress the prohibition on sexual activity in the period during which they have to wait, and thus they acquire the intimate connection between prohibition and sexuality. Men usually break through this prohibition if they can satisfy the condition of debasing the object, and so they carry on this condition into their love in later life.

In view of the strenuous efforts being made in the civilized world today to reform sexual life, it will not be superfluous to give a reminder that psychoanalytic research is as remote from tendentiousness as any other kind of research. It has no other end in view than to throw light on things by tracing what is manifest back to what is hidden. It is quite satisfied if reforms make use of its findings to replace what is injurious with something more advantageous; but it cannot predict whether other institutions may not result in other, and perhaps graver, sacrifices.

3

The fact that the curb put upon love by civilization involves a universal tendency to debase sexual objects will perhaps lead us to turn our attention from the object to the drives themselves. The damage caused by the initial frustration [*Versagung*] of sexual pleasure [*Sexualgenusses*] is seen in the fact that the freedom later given to that pleasure in marriage does not bring full satisfaction. But at the same time, if sexual freedom is unrestricted from the outset the result is no better. It can easily be shown that the psychical value of erotic needs is reduced as soon as their satisfaction becomes easy. An obstacle is required in order to heighten libido; and where natural resistances to satisfaction have not been sufficient

men have at all times erected conventional ones so as to be able to enjoy love. This is true both of individuals and of nations. In times in which [188] there were no difficulties standing in the way of sexual satisfaction, such as perhaps during the decline of the ancient civilizations, love became worthless and life empty, and strong reaction-formations were required to restore indispensable affective values. In this connection it may be claimed that the ascetic current in Christianity created psychical values for love which pagan antiquity was never able to confer on it. This current assumed its greatest importance with the ascetic monks, whose lives were almost entirely occupied with the struggle against libidinal temptation.

One's first inclination is no doubt to trace back the difficulties revealed here to universal characteristics of our organic drives. It is no doubt also true in general that the psychical importance of a drive rises in proportion to its frustration. Suppose a number of totally different human beings were all equally exposed to hunger. As their imperative need for food mounted, all the individual differences would disappear and in their place one would see the uniform manifestations of the one unappeased drive. But is it also true that with the satisfaction of a drive its psychical value always falls just as sharply? Consider, for example, the relation of a drinker to wine. Is it not true that wine always provides the drinker with the same toxic satisfaction, which in poetry has so often been compared to erotic satisfaction – a comparison acceptable from the scientific point of view as well? Has one ever heard of the drinker being obliged constantly to change his drink because he soon grows tired of keeping to the same one? On the contrary, habit constantly tightens the bond between a man and the kind of wine he drinks. Does one ever hear of a drinker who needs to go to a country where wine is dearer or drinking is prohibited, so that by introducing obstacles he can reinforce the dwindling satisfaction that he obtains? Not at all. If we listen to what our great alcoholics, such as Böcklin,[1] say about their relation to wine, it sounds like the most perfect harmony, a model of a happy marriage. Why is the relation of the lover to his sexual object so very different?

It is my belief that, however strange it may sound, we must reckon with the possibility that something in the nature of the sexual drive itself is unfavourable to the realization of complete satisfaction. If we consider [189] the long and difficult developmental history of the drive, two factors immediately spring to mind which might be made responsible for this

1 Floerke (1902, 16).

difficulty. Firstly, as a result of the diphasic onset of object choice, and the interposition of the barrier against incest, the final object of the sexual drive is never any longer the original object but only a surrogate for it. Psychoanalysis has shown us that, when the original object of a wishful impulse has been lost as a result of repression [*Verdrängung*], it is frequently represented by an endless series of substitutive objects none of which, however, brings full satisfaction. This may explain the inconstancy in object choice, the 'craving for stimulation'[1] which is so often a feature of the love of adults.

Secondly, we know that the sexual drive is originally divided into a great number of components – or rather, it develops out of them – some of which cannot be taken up into the drive in its later form, but have at an earlier stage to be suppressed or put to other uses. These are above all the coprophilic drive components, which have proved incompatible with our aesthetic standards of culture, probably since, as a result of our adopting an erect gait, we raised our organ of smell from the ground.[2] The same is true of a large portion of the sadistic urges which are a part of erotic life. But all such developmental processes affect only the upper layers of the complex structure. The fundamental processes which produce erotic excitation remain unaltered. The excremental is all too intimately and inseparably bound up with the sexual; the position of the genitals – *inter urinas et faeces* [between urine and faeces] – remains the decisive and unchangeable factor. One might say here, varying a well-known saying of the great Napoleon: 'Anatomy is destiny.'[3] The genitals themselves have not taken part in the development of the human body in the direction of beauty: they have remained animal, and thus love, too, has remained in essence just as animal as it ever was. The drives to love are hard to educate; education of them achieves now too much, now too
[190] little. What civilization [*Kultur*] aims at making out of them seems unattainable except at the price of a sensible loss of pleasure; the persistence of the impulses that could not be made use of can be detected in sexual activity in the form of non-satisfaction.

Thus we may perhaps be forced to become reconciled to the idea that it is quite impossible to adjust the claims of the sexual drive to the demands of civilization; that in consequence of its cultural development

1 ['*Reizhunger*.' This term seems to have been introduced by Hoche and Bloch. See Freud's *Three Essays* (1905*d*), *RSE*, **7**, 134–5 *n*.]

2 [Cf. two long footnotes to Chapter IV of *Civilization and its Discontents* (1930*a*), ibid., **21**, 90–1 *n*. and 95–6 *n*.]

3 [This paraphrase appears again in 'The Dissolution of the Oedipus Complex' (1924*d*), ibid., **19**, 171.]

[*Kulturentwicklung*] renunciation and suffering, as well as the danger of extinction in the remotest future, cannot be avoided by the human race. This gloomy prognosis rests, it is true, on the single conjecture that the non-satisfaction that goes with civilization [*kulturelle Unbefriedigung*] is the necessary consequence of certain peculiarities which the sexual drive has assumed under the pressure of culture. The very incapacity of the sexual drive to yield complete satisfaction as soon as it submits to the first demands of civilization [*Kultur*] becomes the source, however, of the noblest cultural achievements [*Kulturleistungen*] which are brought into being by ever more extensive sublimation of its drive components. For what motive would men have for putting sexual drive forces to other uses if, by any distribution of those forces, they could obtain fully satisfying pleasure? They would never abandon that pleasure and they would never make any further progress. It seems, therefore, that the irreconcilable difference between the demands of the two drives – the sexual and the egoistic – has made men capable of ever higher achievements, though subject, it is true, to a constant danger, to which, in the form of neurosis, the weaker are succumbing today.

It is not the aim of science either to frighten or to console. But I myself am quite ready to admit that such far-reaching conclusions as those I have drawn should be built on a broader foundation, and that perhaps developments in other directions may enable mankind to correct the results of the developments I have here been considering in isolation.

THE TABOO OF VIRGINITY

We know from Grubrich-Simitis (1993, 211; trans., 165) that Freud had originally entitled this paper 'The Taboo of Virginity and Sexual Bondage' ('Das Tabu der Virginität und die sexuelle Hörigkeit') but he shortened it at the suggestion of Ferenczi and Rank.

The present translation is a slightly revised and corrected reprint of the *SE* version.

The paper was written in September, 1917, but was not published till the following year. In spite of the gap of several years separating this paper from the two preceding ones, it has seemed right to bring them together, since Freud himself assembled them under a common heading. *Totem and Taboo* (1912–13*a*), *RSE*, **13**, had appeared in the interval since the second paper in the series, and this third one may, from one point of view, be regarded as an addition to the second essay in that work. On the other hand, however, it includes a discussion of the clinical problem of frigidity in women and is in that respect the counterpart of the study of impotence in men in the second paper in the series (see p. 171 ff. above).

THE TABOO OF VIRGINITY

(CONTRIBUTIONS TO THE PSYCHOLOGY OF LOVE III)[t]

Few details of the sexual life [*Sexuallebens*][T] of primitive peoples are so alien to our own feelings as their estimate of virginity, the state in a woman of being untouched. The high value which her suitor places on a woman's virginity seems to us so firmly rooted, so much a matter of course, that we find ourselves almost at a loss if we have to give reasons for this opinion. The demand that a girl shall not bring to her marriage with a particular man any memory of sexual relations with another is, indeed, nothing other than a logical continuation of the right to exclusive possession of a woman, which forms the essence of monogamy, the extension of this monopoly to cover the past. [193] *Sex*

From this point we have no trouble in justifying what looked at first like a prejudice, by referring to our views on the erotic life of women. Whoever is the first to satisfy a virgin's desire for love, long and laboriously held in check, and who in doing so overcomes the resistances which have been built up in her through the influences of her milieu and education, that is the man she will take into a lasting relationship, the possibility of which will never again be open to any other man. This experience creates a state of bondage[1] in the woman which guarantees that possession of her shall continue undisturbed and makes her able to resist new impressions and enticements from outside.

The expression 'sexual bondage' was chosen by von Krafft-Ebing (1892) to describe the phenomenon of a person's acquiring an unusually high degree of dependence and lack of self-reliance in relation to another person with whom he has a sexual relationship. This bondage can on occasion extend very far, as far as the loss of all independent will and as far as causing a person to suffer the greatest sacrifices of his own interests; the author, however, does not fail to remark that a certain measure

1 [See Editors' Note, p. 181 above.]

of such dependence 'is absolutely necessary, if the tie is to last for any length of time'. Some such measure of sexual bondage is, indeed, indis-
Kultur pensable to the maintenance of civilized [*kulturellen*][T] marriage and to
[194] holding at bay the polygamous tendencies which threaten it, and in our social communities this factor is regularly reckoned upon.

Von Krafft-Ebing derives the formation of sexual bondage from a conjunction of an 'uncommon degree of the state of being in love and of weakness of character' in one person and unbounded egoism in the other. Analytic experience, however, will not let us rest satisfied with this simple attempt at explanation. We can see, rather, that the decisive factor is the amount of sexual resistance that is overcome and, in addition, the fact that the process of overcoming the resistance is concentrated and happens only once. This state of bondage is, accordingly, far more frequent and more intense in women than in men, though it is true it occurs in the latter more often nowadays than it did in ancient times. Wherever we have been able to study sexual bondage in men it has shown itself as resulting from an overcoming of psychical impotence through one particular woman, to whom the man in question has remained subsequently bound.[1] Many strange marriages and not a few tragic events – even some with far-reaching consequences – seem to owe their explanation to this origin.

Turning to the attitude of primitive peoples, it is incorrect to describe it by declaring that they set no value on virginity and to submit as proof of this the fact that they perform the defloration of girls outside marriage and before the first act of marital intercourse. On the contrary, it appears that for them, too, defloration is a significant act; but it has become the subject of a taboo – of a prohibition which may be described as religious. Instead of reserving it for the girl's bridegroom and future partner in marriage, custom demands that *he shall shun the performance of it*.[2]

It is no part of my purpose to make a full collection of the literary evidence for the existence of this custom of prohibition, to pursue its geographical distribution and to enumerate all the forms in which it is expressed. I shall content myself, therefore, with stating the fact that the practice of rupturing the hymen in this way outside the subsequent
[195] marriage is very widespread among primitive races living today. As Crawley says: 'This marriage ceremony consists in perforation of the

1 [A remark on this can be found in a footnote to Freud's late paper 'Analysis Terminable and Interminable' (1937*c*), *RSE*, **23**, 228 *n*.]

2 Cf. Crawley (1902), Ploss & Bartels (1891), Frazer (1911*b*) and Havelock Ellis [1910*b*].

hymen by some appointed person other than the husband; it is most common in the lowest stages of culture, especially in Australia.' (Crawley, 1902, 347.)

If, however, defloration is not to result from the first act of marital intercourse, then it must have been carried out beforehand – whatever the way and whoever the agent may have been. I shall quote a few passages from Crawley's book, mentioned above, which provide information on these points but also give grounds for some critical observations.

(Ibid., 191.) 'Thus in the Dieri and neighbouring tribes (in Australia) it is the universal custom when a girl reaches puberty to rupture the hymen (*Journal of the Royal Anthropological Institute*, **24**, 169). In the Portland and Glenelg tribes this is done to the bride by an old woman; and sometimes white men are asked for this reason to deflower maidens (Brough Smith, [1878], **2**, 319).'

(Ibid., 307.) 'The artificial rupture of the hymen sometimes takes place in infancy, but generally at puberty. . . . It is often combined, as in Australia, with a ceremonial act of intercourse.'

(Ibid., 348.) (Of Australian tribes among which the well-known exogamous marriage restrictions are in force, from communications by Spencer & Gillen [1899]:) 'The hymen is artificially perforated, and then the assisting men have access (ceremonial, be it observed) to the girl in a stated order. . . . The act is in two parts, perforation and intercourse.'

(Ibid., 349.) 'An important preliminary of marriage amongst the Masai (in Equatorial Africa) is the performance of this operation on the girl (J. Thomson, [1887], **2**, 258). This defloration is performed by the father of the bride amongst the Sakais (Malay), Battas (Sumatra), and Alfoers of Celebes (Ploss & Bartels, [1891], **2**, 490). In the Philippines there were certain men whose profession it was to deflower brides, in case the hymen had not been ruptured in childhood by an old woman who was sometimes employed for this (Featherman, [1885–91], **2**, 474). The defloration of the bride was amongst some Eskimo tribes entrusted to the *angekok*, or priest (ibid., **3**, 406).'

The critical remarks I referred to are concerned with two points. [196]
Firstly, it is a pity that in these reports a more careful distinction is not made between simple rupture of the hymen without intercourse, and intercourse for the purpose of effecting this rupture. There is only one passage in which we are told expressly that the procedure falls into two actions: defloration (carried out by hand or with some instrument) and the act of intercourse which follows it. The material in Ploss & Bartels

(1891), in other respects so rich, is almost useless for our purpose, because in their presentation of it the psychological importance of the act of defloration is completely displaced in favour of its anatomical results. Secondly, we should be glad to be informed how the 'ceremonial' (purely formal, ritual or official) coitus, which takes place on these occasions, differs from ordinary sexual intercourse. The authors to whom I have had access either have been too embarrassed to discuss the matter or have once again underestimated the psychological importance of such sexual details. It is to be hoped that the first-hand accounts of travellers and missionaries may be more complete and less ambiguous, but since this literature, which is for the most part foreign, is for the time being inaccessible I cannot say anything definite on the subject.[1] Besides, we may get round the problem arising over this second point if we bear in mind the fact that a ceremonial mock coitus would after all only represent a substitute for, and perhaps replace altogether, an act that in earlier times would have been carried out completely.[2]

There are various factors which can be adduced to explain this taboo of virginity and which I will enumerate and consider briefly. When a virgin is deflowered, her blood is as a rule shed; the first attempt at explanation, then, is based on the horror of blood among primitive races who consider blood as the seat of life. This blood taboo is seen in numerous kinds of observances which have nothing to do with sexuality; it is obviously connected with the prohibition against murder and forms a
[197] protective measure against the primal thirst for blood, primaeval man's lust for killing. According to this view [*Auffassung*][T] the taboo of virginity is connected with the taboo of menstruation which is almost universally maintained. Primitive people cannot dissociate the puzzling phenomenon of this monthly flow of blood from sadistic ideas. Menstruation, especially its first appearance, is interpreted as the bite of some spirit animal, perhaps as a sign of sexual intercourse with this spirit. Occasionally some report gives grounds for recognizing the spirit as that of an ancestor and then, supported by [*in Anlehnung*][T] other findings,[3] we understand that the menstruating girl is taboo because she is the property of this ancestral spirit.

Other considerations, however, warn us not to overestimate the influence of a factor such as the horror of blood. It has not, after all, been

1 [This was written during the First World War.]

2 In numerous other examples of marriage ceremonies there can be no doubt that people other than the bridegroom, for example his assistants and companions (our traditional 'groomsmen' ['*Kranzelherrn*']), are granted full sexual access to the bride.

3 Cf. *Totem and Taboo* (1912–13*a*) [*RSE*, **13**, 130–3].

strong enough to suppress practices like the circumcision of boys and the still more cruel equivalent with girls (excision of the clitoris and labia minora) which are to some extent the custom in these same races, nor to abolish the prevalence of other ceremonies involving bloodshed. It would not therefore be surprising, either, if this horror were overcome for the benefit of the husband on the occasion of the first cohabitation.

There is a second explanation, also unconcerned with sexuality, which has, however, a much more general scope than the first. It suggests that primitive man is prey to a perpetual lurking apprehensiveness,[1] just as in the psychoanalytic theory of the neuroses we claim to be the case with people suffering from anxiety neurosis. This apprehensiveness will appear most strongly on all occasions which differ in any way from the usual, which involve something new or unexpected, something not understood or uncanny [*Unheimliches*]. This is also the origin of the ceremonial practices, widely adopted in later religions, which are connected with the beginning of every new undertaking, the start of every new period of time, the first-fruits of human, animal and plant life. The dangers which the anxious man believes to be threatening him never appear more vivid in his expectation than on the threshold of a dangerous situation, and then, too, is the only time when protecting himself against them is of any use. The first act of intercourse in marriage can certainly claim, on grounds of importance, to be preceded by such [198]
precautionary measures. These two attempts at explanation, based on horror of blood and on fear of first occurrences, do not contradict but rather reinforce each other. The first occasion of sexual intercourse is certainly a critical action, all the more so if it is to involve a flow of blood.

A third explanation – the one which Crawley prefers – draws attention to the fact that the taboo of virginity is part of a large totality which embraces the whole of sexual life. It is not only the first coitus with a woman which is taboo but sexual intercourse in general; one might almost say that women are altogether taboo. A woman is not only taboo in particular situations arising from her sexual life such as menstruation, pregnancy, childbirth and lying in; apart from these situations, intercourse with women is subject to such solemn and numerous restrictions that we have every reason to doubt the reputed sexual freedom of savages. It is true that, on particular occasions, primitive man's sexuality will override all inhibitions [*Hemmungen*][T]; but for the most part it

1 ['*Angstbereitschaft*' here and just below: usually translated 'preparedness of anxiety' in the *RSE*. See also *RSE*, **24**, 56–7.]

seems to be more strongly held in check by prohibitions than it is at higher levels of civilization [*Kulturstufen*]. Whenever the man undertakes some special enterprise, like setting out on an expedition, a hunt or a campaign, he is obliged to keep away from his wife and especially from sexual intercourse with her; otherwise she will paralyse his strength and bring him bad luck. In the usages of daily life as well there is an unmistakable tendency to keep the sexes apart. Women live with women, men with men; family life, in our sense, seems scarcely to exist in many primitive tribes. This separation sometimes goes so far that one sex is not allowed to say aloud the personal names of members of the other sex, and that the women develop a language with a special vocabulary. Sexual needs will from time to time break through these barriers of separation afresh, but in some tribes even the encounters of husband and wife have to take place outside the house and in secret.

Wherever primitive man has set up a taboo he fears some danger and it cannot be disputed that a generalized dread of women is expressed in all these rules of avoidance. Perhaps this dread is based on the fact that woman is different from man, forever incomprehensible and mysterious, strange and therefore apparently hostile. The man is afraid of being weakened by the woman, infected with her femininity and of then
[199] showing himself incapable. The effect which coitus has of discharging tensions and causing flaccidity may be the prototype of what the man fears; and realization of the influence which the woman gains over him through sexual intercourse, the consideration she thereby forces from him, may justify the extension of this fear. In all this there is nothing obsolete, nothing which is not still alive among ourselves.

Many observers of primitive races living today have put forward the view that their impulsions in love are relatively weak and never reach the degree of intensity which we are accustomed to meet with in civilized men. Other observers have contradicted this opinion, but in any case the practice of the taboos we have described testifies to the existence of a force which opposes love by rejecting women as strange and hostile.

Crawley, in language which differs only slightly from the current terminology of psychoanalysis, declares that each individual is separated from the others by a 'taboo of personal isolation', and that it is precisely the minor differences in people who are otherwise alike that form the basis of feelings of strangeness and hostility between them. It would be tempting to pursue this idea and to derive from this 'narcissism of minor

differences'[1] the hostility which in every human relation we see fighting successfully against feelings of fellowship and overpowering the commandment that all men should love one another. Psychoanalysis believes that it has discovered a large part of what underlies the narcissistic rejection of women by men, which is so much mixed up with despising them, in drawing attention to the castration complex and its influence on the opinion in which women are held.

We can see, however, that these latter considerations have led us to range far beyond our subject. The general taboo of women throws no light on the particular rules concerning the first sexual act with a virgin. As far as they are concerned, we have not got beyond the first two explanations, based on horror of blood and fear of first occurrences, and even these, we must point out, do not touch the core of the taboo in question. It is quite clear that the intention underlying this taboo is that of *denying or sparing precisely the future husband* something which cannot [200]
be dissociated from the first sexual act, although according to our introductory observations this very relation would lead to the woman becoming specially bound to this one man.

It is not our task on this occasion to discuss the origin and ultimate significance of taboo observances. I have done this in my book *Totem and Taboo* [1912–13*a*], where I have given due consideration to the part played by primal ambivalence in determining the formation of taboo and have traced the genesis of the latter from the prehistoric events which led to the founding of the human family. We can no longer recognize an original meaning of this kind in taboos observed among primitive tribes today. We forget all too easily, in expecting to find any such thing, that even the most primitive peoples exist in a culture far removed from that of primaeval days, which is just as old as our own from the point of view of time and like ours corresponds to a later, if different, stage of development.

Today we find taboos among primitive peoples already elaborated into an intricate system of just the sort that neurotics among ourselves develop in their phobias, and we find old motifs replaced by new ones that fit together harmoniously. Leaving aside these genetic [*genetischen*][T] problems, then, we will go back to the idea that primitive man institutes a taboo where he fears some danger. Taking it generally this danger is a psychical one, for primitive man is not impelled at this point to make two distinctions, which to us it seems cannot be disregarded. He does not

1 [Freud returns to this in Chapter VI of *Group Psychology* (1921*c*), *RSE*, **18**, 94, and in Chapter V of *Civilization and its Discontents* (1930*a*), ibid., **21**, 102.]

separate material from psychical danger, nor real from imaginary. In his consistently applied animistic view of the universe, every danger springs from the hostile intention of some being with a soul [*Wesens*] like himself, and this is as much the case with dangers which threaten him from some natural force as it is with those from other human beings or animals. But on the other hand he is accustomed to project his own internal impulses [*Regungen*][T] of hostility on to the external world, to ascribe them, that is, to the objects which he feels to be disagreeable or even merely strange. In this way women also are regarded as being a source of such dangers, and the first act of sexual intercourse with a woman stands out as a danger of particular intensity.

[201] Now I believe that we shall receive some indication as to what this heightened danger is and why it threatens precisely the future husband, if we examine more closely the behaviour under the same circumstances of women of our own stage of civilization today. I will submit in advance, as the result of this examination, that such a danger really exists, so that with the taboo of virginity primitive man is defending himself against a correctly sensed, although psychical, danger.

We consider it to be the normal reaction for a woman after intercourse to embrace the man, pressing him to her at the climax of satisfaction, and we see this as an expression of her gratitude and a token of lasting bondage. But we know it is by no means the rule that the first occasion of intercourse should lead to this behaviour; very frequently it means only disappointment for the woman, who remains cold and unsatisfied, and it usually requires quite a long time and frequent repetition of the sexual act before she, too, begins to find satisfaction in it. There is an unbroken series from these cases of mere initial frigidity which soon vanishes, up to the cheerless phenomenon of permanent and obstinate frigidity which no tender efforts on the part of the husband can overcome. I believe this frigidity in women is not yet sufficiently understood and, except for those cases which must be blamed on the man's insufficient potency, calls for elucidation, possibly through allied phenomena.

I do not want to introduce at this point the attempts – which are so frequent – to take flight from the first occasion of sexual intercourse, because they are open to several interpretations and are in the main, although not altogether, to be understood as an expression of the general female tendency to take a defensive line. As against this, I do believe that light is thrown on the riddle of female frigidity by certain pathological cases in which, after the first and indeed after each repeated instance of sexual intercourse, the woman gives unconcealed expression

to her hostility towards the man by abusing him, raising her hand against him or actually striking him. In one very clear case of this kind, which I was able to submit to a thorough analysis, this happened, although the woman loved the man very much, used to demand intercourse herself and unmistakably found great satisfaction in it. I think that this strange, contradictory reaction is the result of the very same impulses which [202] ordinarily can only find expression as frigidity – which, that is, can hold back the tender reaction without at the same time being able to put themselves into effect. In the pathological case we find separated so to speak into its two components what in the far more common instance of frigidity is united to produce an inhibiting effect, just like the process we have long recognized in the so-called 'diphasic symptoms' of obsessional neurosis.[1] The danger which is thus aroused through the defloration of a woman would consist in drawing her hostility down upon oneself, and the prospective husband is just the person who would have every reason to avoid such enmity.

Now analysis enables us to infer without difficulty which impulses in women take part in bringing about this paradoxical behaviour, in which I expect to find the explanation of frigidity. The first act of intercourse mobilizes a number of impulses which are out of place in the desired feminine attitude, some of which, incidentally, need not recur during subsequent intercourse. In the first place we think of the pain which defloration causes a virgin, and we are perhaps even inclined to consider this factor as decisive and to give up the search for any others. But we cannot well ascribe such importance to this pain; we must rather substitute for it the narcissistic injury which proceeds from the destruction of an organ and which is even represented in a rationalized form in the knowledge that loss of virginity brings a diminution of sexual value. The marriage customs of primitive peoples, however, contain a warning against overestimating this. We have heard that in some cases the rite falls into two phases: after the hymen has been ruptured (by hand or with some instrument) there follows a ceremonial act of coitus or mock intercourse with the representatives of the husband, and this proves to us that the purpose of the taboo observance is not fulfilled by avoiding anatomical defloration, that the husband is to be spared something else as well as the woman's reaction to the painful injury.

We find a further reason for the disappointment experienced in the first act of intercourse in the fact that, with civilized women at least, fulfilment cannot be in accordance with expectations. Before this, sexual [203]

1 [See the 'Rat Man' case history (1909*d*), *RSE*, **10**, 146–7 and footnote 2.]

intercourse has been associated in the strongest possible way with prohibitions; lawful and permissible intercourse is not, therefore, felt to be the same thing. Just how close this association can be is demonstrated in an almost comic fashion by the efforts of so many girls about to be married to keep their new love relationship secret from everyone outside, and indeed even from their parents, where there is no real necessity to do so and no objection can be looked for. Girls often say openly that their love loses value for them if other people know of it. On occasion this feeling can become dominating and can completely prevent the development of any capacity for love in a marriage. The woman only recovers her susceptibility to tender feelings in an illicit relationship which has to be kept secret, and in which alone she knows for certain that her own will is uninfluenced [cf. pp. 173–4 above].

However, this motive does not go deep enough either; besides, being bound up with civilized conditions [*Kulturbedingungen*], it fails to provide a satisfactory connection with the state of affairs among primitive peoples. All the more important, therefore, is the next factor, which is based on the evolution of the libido. We have learnt from analytic researches how universal and how powerful the earliest allocations of libido are. In these we are concerned with infantile sexual wishes which are clung to (in women usually a fixation of the libido on the father or a brother who takes his place) – wishes which frequently enough were directed towards other things than intercourse, or included it only as a dimly perceived goal. The husband is almost always so to speak only a substitute, never the right man; it is another man – in typical cases the father – who has first claim to a woman's love, the husband at most takes second place. It depends on how intense this fixation is and on how obstinately it is maintained whether the substitute is rejected as unsatisfying. Frigidity is thus among the genetic determinants of neuroses. The more powerful the psychical element in a woman's sexual life is, the greater will be the capacity for resistance shown by her distribution of libido to the upheaval of the first sexual act, and the less overpowering will be the effect which bodily possession of her can produce. Frigidity may then become established as a neurotic inhibition or provide the
[204] foundation for the development of other neuroses and even a moderate diminution of potency in the man will greatly contribute to help this process.

The customs of primitive peoples seem to take account of this motif of the early sexual wish by handing over the task of defloration to an elder, priest or holy man, that is, to a substitute for the father (see above

[pp. 184–5]). There seems to me to be a direct path leading from this custom to the highly vexed question of the *jus primae noctis* of the mediaeval lord of the manor. A. J. Storfer (1911) has put forward the same view and has in addition, as Jung (1909) had already done before him, interpreted the widespread tradition of the 'Tobias nights' (the custom of continence during the first three nights of marriage) as an acknowledgement of the privilege of the patriarch. It agrees with our expectations, therefore, when we find the images of gods included among the father surrogates entrusted with defloration. In some districts of India, the newly married woman was obliged to sacrifice her hymen to the wooden lingam, and, according to St Augustine's account, the same custom existed in the Roman marriage ceremony (of his time?), but modified so that the young wife only had to seat herself on the gigantic stone phallus of Priapus.[1]

There is another motive, reaching down into still deeper layers, which can be shown to bear the chief blame for the paradoxical reaction towards the man, and which, in my view, further makes its influence felt in female frigidity. The first act of intercourse activates in a woman other impulses of long standing as well as those already described, and these are in complete opposition to her womanly role and function.

We have learnt from the analysis of many neurotic women that they go through an early age in which they envy their brothers their sign of masculinity and feel at a disadvantage and humiliated because of the lack of it (actually because of its diminished size) in themselves. We include this 'envy for the penis' in the 'castration complex'. If we understand 'masculine' as including the idea of wishing to be masculine, then the designation 'masculine protest' fits this behaviour; the phrase was coined by Adler [1910][2] with the intention of proclaiming this factor as being [205]
responsible for neurosis in general. During this phase, little girls often make no secret of their envy, nor of the hostility towards their favoured brothers which arises from it. They even try to urinate standing upright like their brothers in order to prove the equality which they lay claim to. In the case already described [pp. 190–1 above] in which the woman used to show uncontrolled aggression after intercourse towards her husband, whom otherwise she loved, I was able to establish that this phase had existed before that of object choice. Only later was the little girl's libido directed towards her father, and then, instead of wanting to have a penis, she wanted – a child.[3]

I should not be surprised if in other cases the order in which these

1 Ploss & Bartels (1891, **1**, xii) and Dulaure (1905, 142).

2 [Cf. the third section of Freud's 'History of the Psychoanalytic Movement' (1914*d*), *RSE*, **14**, 47–8.]

3 Cf. 'On Transformations of Drive as Exemplified in Anal Erotism' (1916–17*e*) [ibid., **17**, 117].

impulses occurred were reversed and this part of the castration complex became effective only after a choice of object had been successfully made. But the masculine phase in the girl in which she envies the boy for his penis is in any case developmentally the earlier, and it is closer to the original narcissism than it is to object love.

Some time ago I chanced to have an opportunity of obtaining insight into a dream of a newly married woman which was recognizable as a reaction to the loss of her virginity. It betrayed spontaneously the woman's wish to castrate her young husband and to keep his penis for herself. Certainly there was also room for the more innocent interpretation that what she wished for was the prolongation and repetition of the act, but several details of the dream did not fit into this meaning and the character as well as the subsequent behaviour of the woman who had the dream gave evidence in favour of the more serious view. Behind this envy for the penis, there comes to light the woman's hostile bitterness against the man, which never completely disappears in the relations between the sexes, and which is clearly indicated in the strivings and in the literary productions of 'emancipated' women. In a palaeo-biological speculation, Ferenczi has traced back this hostility of women – I do not know if he is the first to do so – to the period in time when the sexes became differentiated.[1] At first, in his opinion, copulation took place between two similar individuals, one of which, however,
[206] developed into the stronger and forced the weaker one to submit to sexual union. The feelings of bitterness arising from this subjection still persist in the present-day disposition of women. I do not think there is any harm in employing such speculations, so long as one avoids setting too much value on them.

After this enumeration of the motives for the paradoxical reaction of women to defloration, traces of which persist in frigidity, we may sum up by saying that a woman's *immature sexuality* is discharged on to the man who first makes her acquainted with the sexual act. This being so, the taboo of virginity is reasonable enough and we can understand the rule which decrees that precisely the man who is to enter upon a life shared with this woman shall avoid these dangers. At higher stages of civilization the importance attributed to this danger diminishes in the face of her promise of bondage and no doubt of other motives and inducements; virginity is looked upon as a possession which the husband is not called upon to renounce. But analysis of disturbed marriages teaches us that the motives which seek to drive a woman to take

1 [Cf. Ferenczi (1924) where he explains that he expressed these views privately to Freud before publishing them.]

vengeance for her defloration are not completely extinguished even in the mental life of civilized women. I think it must strike the observer in how uncommonly large a number of cases the woman remains frigid and feels unhappy in a first marriage, whereas after it has been dissolved she becomes a tender wife, able to make her second husband happy. The archaic reaction has, so to speak, exhausted itself on the first object.

The taboo of virginity, however, even apart from this has not died out in our civilized existence. It is known to the popular mind and writers have on occasion made use of this material. A comedy by Anzengruber[1] shows how a simple peasant lad is deterred from marrying his intended bride because she is 'a wench who'll cost her first his life'. For this reason he agrees to her marrying another man and is ready to take her when she is a widow and no longer dangerous. The title of the play, *Das Jungferngift* ['Virgin's Venom'], reminds us of the habit of snake charmers, who make poisonous snakes first bite a piece of cloth in order to handle them afterwards without danger.[2]

The taboo of virginity and something of its motivation has been [207] depicted most powerfully of all in a well-known dramatic character, that of Judith in Hebbel's tragedy *Judith und Holofernes*. Judith is one of those women whose virginity is protected by a taboo. Her first husband was paralysed on the bridal night by a mysterious anxiety, and never again dared to touch her. 'My beauty is like belladonna,' she says. 'Enjoyment of it brings madness and death.' When the Assyrian general is besieging her city, she conceives the plan of seducing him by her beauty and of destroying him, thus employing a patriotic motive to conceal a sexual one. After she has been deflowered by this powerful man, who boasts of his strength and ruthlessness, she finds the strength in her fury to strike off his head, and thus becomes the liberator of her people. Beheading is well known to us as a symbolic substitute for castrating; Judith is accordingly the woman who castrates the man who has deflowered her, which was just the wish of the newly married woman expressed in the dream I reported. It is clear that Hebbel has intentionally sexualized the patriotic narrative from the Apocrypha of the Old Testament, for there Judith is

1 [The Viennese dramatist (1839–89).]

2 A masterly short story by Arthur Schnitzler (*Das Schicksal des Freiherrn von Leisenbohg*) ['The Fate of Freiherr von Leisenbohg'] deserves to be included here, in spite of the rather different situation. The lover of an actress who is very experienced in love is dying as the result of an accident. He creates a sort of new virginity for her, by putting a curse of death on the man who is the first to possess her after himself. For a time the woman with this taboo upon her does not venture on any love affair. However, after she has fallen in love with a singer, she hits on the solution of first granting a night to the Freiherr von Leisenbohg, who has been pursuing her for years. And the curse falls on him: he has a stroke as soon as he learns the motive behind his unexpected good fortune in love.

able to boast after her return that she has not been defiled, nor is there in the biblical text any mention of her uncanny wedding night. But probably, with the fine perception of a poet, he sensed the ancient motive, which had been lost in the tendentious narrative, and has merely restored its earlier content to the material.

Sadger (1912) has shown in a penetrating analysis how Hebbel was determined in his choice of material by his own parental complex, and how he came to take the part of the woman so regularly in the struggle between the sexes, and to feel his way into [*einzufühlen*][T] the most hidden impulses of her mind. He also quotes the motives which the poet himself gives for the alteration he has made in the material, and he rightly finds them artificial and as though intended to justify *outwardly* something the poet himself is unconscious of, while at bottom concealing it. I will not dispute Sadger's explanation of why Judith, who according to the biblical narrative is a widow, has to become a *virgin* widow. He refers to the purpose found in childish phantasies of denying the sexual intercourse of the parents and of turning the mother into an untouched virgin. But I will add: after the poet has established his heroine's virginity, his sensitive imagination dwells on the hostile reaction released by the violation of her maidenhood.

Einfühlung
[208]

We may say, then, in conclusion that defloration not only has the one, civilized consequence of binding the woman lastingly to the man; it also unleashes an archaic reaction of hostility towards him, which can assume pathological forms that are frequently enough expressed in the appearance of inhibitions in the erotic side of married life, and to which we may ascribe the fact that second marriages so often turn out better than first. The taboo of virginity, which seems so strange to us, the horror with which, among primitive peoples, the husband avoids the act of defloration, are fully justified by this hostile reaction.

It is interesting that in one's capacity as analyst one can meet with women in whom the opposed reactions of bondage and hostility both find expression and remain intimately associated with each other. There are women of this kind who seem to have fallen out with their husbands completely and who all the same can make only vain efforts to free themselves. As often as they try to direct their love towards some other man, the image of the first, although he is no longer loved, intervenes with inhibiting effect. Analysis then teaches us that these women, it is true, still cling to their first husbands in a state of bondage, but no longer through affection. They cannot get away from them, because they have not completed their revenge upon them, and in pronounced cases they have not even brought the impulses for vengeance to consciousness.

THE PSYCHOANALYTIC VIEW OF PSYCHOGENIC DISTURBANCE OF VISION

The present translation is a slightly revised and corrected reprint of the *SE* version.

This was written as a contribution to a *Festschrift* in honour of Leopold Königstein, a well-known Viennese ophthalmologist, who was one of Freud's oldest friends. He described it in a letter to Ferenczi, written on April 12, 1910, as being a mere *pièce d'occasion* and of no value (Jones, 1955, 274). It contains one passage at least, however, of very special interest. For it was here that for the first time he made use of the term 'ego drives', explicitly identified them with the self-preservative drives and ascribed to them a vital part in the function of repression. Some account of the development of Freud's views on the drives can be found in the Editors' Note to 'Drives and their Vicissitudes' (1915*c*), *RSE*, **14**. It is also worth remarking that in the later paragraphs of this paper (p. 206 f. below) Freud expresses with particular definiteness his belief that mental phenomena are ultimately inextricable from physical ones.

THE PSYCHOANALYTIC VIEW OF PSYCHOGENIC DISTURBANCE OF VISION

Gentlemen, I propose to take the example of psychogenic disturbance of vision, in order to show you the modifications which have taken place in our view [*Auffassung*][T] of the genesis of disorders of this kind under the influence of psychoanalytic methods of investigation. As you know, hysterical blindness is taken as the type of a psychogenic visual disturbance. It is generally believed, as a result of the researches of the French school (including such men as Charcot, Janet and Binet), that the genesis of these cases is understood. For we are in a position to produce blindness of this kind experimentally if we have at our disposal someone who is susceptible to somnambulism. If we put him into deep hypnosis and suggest the idea [*Vorstellung*][T] to him that he sees nothing with one of his eyes, he will in fact behave as though he had become blind in that eye, like a hysteric who has developed a visual disturbance spontaneously. We may thus construct the mechanism of spontaneous hysterical disturbances of vision on the model of suggested hypnotic ones. In a hysteric the idea of being blind arises, not from the prompting of a hypnotist, but spontaneously – by autosuggestion, as people say; and in both cases this idea is so powerful that it turns into reality, exactly like a suggested hallucination, paralysis, etc. [211]

This seems perfectly sound and will satisfy anyone who can ignore the many enigmas that lie concealed behind the concepts of hypnosis, suggestion and autosuggestion. Autosuggestion in particular raises further questions. When and under what conditions does an idea become so powerful that it is able to behave like a suggestion and turn into reality without more ado? Closer investigation has taught us that we cannot answer this question without calling the concept of the 'unconscious' to our assistance. Many philosophers rebel against the assumption of a mental [*seelischen*][T] unconscious of this kind, because they have not concerned themselves with the phenomena which compel us to make that assumption. Psychopathologists have found that they cannot avoid [212]

Seele

working with such things as unconscious mental processes, unconscious ideas, and so on.

Appropriate experiments have shown that people who are hysterically blind do nevertheless see in some sense, though not in the full sense. Excitations [*Erregungen*][T] of the blind eye may have certain psychical consequences (for instance, they may produce affects) even though they do not become conscious. Thus hysterically blind people are only blind as far as consciousness is concerned; in their unconscious they see. It is precisely observations such as this that compel us to distinguish between conscious and unconscious mental processes.

How does it happen that such people develop the unconscious 'autosuggestion' that they are blind, while nevertheless they see in their unconscious? The reply given by the French researches is to explain that in patients predisposed to hysteria there is an inherent tendency to dissociation – to a falling apart of the connections in their mental field – as a consequence of which some unconscious processes do not continue as far as into the conscious. Let us leave entirely on one side the value that this attempted explanation may have as regards an understanding of the phenomena in question, and let us look at the matter from another angle. As you see, gentlemen, the identity of hysterical blindness with the blindness provoked by suggestion, on which so much stress was laid to begin with, has now been given up. The hysterical patient is blind, not as the result of an autosuggestive idea that he cannot see, but as the result of a dissociation between unconscious and conscious processes in the act of seeing; his idea that he does not see is the well-founded *expression* of the psychical state of affairs and not its *cause*.

If, gentlemen, you complain of the obscurity of this exposition I shall not find it easy to defend. I have tried to give you a synthesis of the views of different investigators, and in doing so I have probably coupled them together too closely. I wanted to condense into a single composite whole the concepts that have been brought up to make psychogenic disturbances intelligible – their origin from excessively powerful [*übermächtigen*] ideas, the distinction between conscious and unconscious mental processes and the assumption of mental dissociation. And I have been no more successful in this than the French writers, at whose head stands
[213] Pierre Janet. I hope, therefore, that you will excuse not only the obscurity but the inaccuracy of my exposition, and will allow me to tell you how psychoanalysis has led us to a view of psychogenic disturbances of vision which is more self-consistent and probably closer to the facts.

Psychoanalysis, too, accepts the assumptions of dissociation and the

unconscious, but relates them differently to each other. Its view is a dynamic one, which traces mental life back to an interplay between forces [*Kräften*][T] that favour or inhibit [*hemmenden*][T] one another. If in any instance one group of ideas remains in the unconscious, psychoanalysis does not infer that there is a constitutional incapacity for synthesis which is showing itself in this particular dissociation, but maintains that the isolation and state of unconsciousness of this group of ideas have been caused by an active opposition on the part of other groups. The process owing to which it has met with this fate is known as 'repression' ['*Verdrängung*'][T] and we regard it as something analogous to a condemnatory judgement in the field of logic. Psychoanalysis points out that repressions of this kind play an extraordinarily important part in our mental life, but that they may also frequently fail and that such failures of repression are the precondition for the formation of symptoms [*Symptombildung*][T]. *Hemmung* *Bildung*

If, then, as we have learnt, psychogenic disturbances of vision depend on certain ideas connected with seeing being cut off from consciousness, we must, on the psychoanalytic view, assume that these ideas have come into opposition with other, more powerful ones, for which we use the collective concept of the 'ego' ['*Ichs*'][T] – a compound which is made up variously at different times – and have for that reason come under repression. But what can be the origin of this opposition, which makes for repression, between the ego and various groups of ideas? You will no doubt notice that it was not possible to frame such a question before the advent of psychoanalysis, for nothing was known earlier of psychical conflict and repression. Our researches, however, have put us in a position to give us the desired answer. Our attention has been drawn to the importance of the drives [*Triebe*][T] in ideational life. We have discovered that every drive tries to make itself effective by operationalizing ideas that are in keeping with its aims. These drives are not always compatible with one another; their interests often come into conflict. Opposition between ideas is only an expression of struggles between the various drives. From the point of view of our attempted explanation, a quite specially important part is played by the undeniable opposition between the drives which subserve sexuality, the attainment of sexual pleasure [*Lust*][T], and those other drives, which have as their aim the self-preservation [*Selbsterhaltung*][T] of the individual – the ego drives.[1] As the [214]

1 [This seems to have been the first occasion on which Freud used this term. (See Editors' Note, p. 199 above.) This may therefore be an appropriate point at which to quote a letter of Freud's of a later date (1921*e*) in which he insisted upon the distinction between the two kinds of drives. The French translation of his *Five Lectures* (1910*a*), by Yves Le Lay, first appeared in the

[215] poet has said, all the organic drives that operate in our mind may be classified as 'hunger' or 'love'.[1] We have traced the 'sexual drive' from its first manifestations in children to its final form, which is described as 'normal'. We have found that it is put together from numerous 'component drives' which are attached to excitations of regions of the body; and we have come to see that these separate drives have to pass through a complicated development before they can be brought effectively to serve the aims of reproduction.[2] The light thrown by psychology on the evolution of our civilization [*Kulturentwicklung*][T] has shown us that it originates mainly at the cost of the sexual component drives, and that these must be suppressed, restricted, transformed and directed to higher aims, in order that the mental constructions [*Konstruktionen*] of civilization may be established. We have been able to recognize as a valuable outcome of these researches something that our colleagues have not yet been willing to believe, namely that the human ailments known as 'neuroses' are derived from the many different ways in which these

Revue de Genève in December, 1920, and January and February, 1921. It was preceded by a long introduction by Professor Édouard Claparède, of Geneva University, giving a general account of psychoanalytic theory. This included a passage which Freud considered misleading, and he wrote to Claparède to protest against it. When, in 1921, the French translation was published in book form, Claparède added an appendix in which he quoted, in a French translation, 'a fragment of this letter'. It is undated but was presumably written early in 1921. What follows is an English translation of the French translation:

'. . . On this point – if you will allow me to make this criticism – you do me an injustice and give your readers some inexact information. It is in the following passage: "8. La libido. L'instinct sexuel est le mobile fondamental de toutes les manifestations de l'activité psychique. [8. Libido. The sexual drive is the fundamental driving force of all the manifestations of psychical activity.]" And you add a little later that neither I nor my disciples have ever been clear on this subject: "Mais il faut savoir lire entre les lignes", you say, "et saisir l'esprit et non la lettre de la théorie. [But one must know how to read between the lines and to grasp the spirit rather than the letter of the theory.]" I am surprised that this usual misunderstanding should have succeeded in slipping under your pen too. I have, on the contrary, declared and repeated with the utmost clarity in relation to the transference neuroses that I made a distinction between the sexual drives and the ego drives and that, so far as I am concerned, "libido" means only the energy of the former, of the sexual drives. It is Jung, and not I, who makes the libido into the equivalent of the driving force of *all* the psychical faculties, and who combats the sexual nature of the libido. Your account fits neither my conception nor Jung's but is a mixture of the two. From me you borrow the sexual nature of the libido and from Jung its generalized meaning. And it is thus that there is created in the imagination of critics a pan-sexualism which exists neither in my views nor in Jung's. As far as I am concerned, I fully realize the existence of the group of ego drives as well as of all that mental life owes to them. The wider public, however, are ignorant of this; it is kept hidden from them. People often behave in the same way when they describe my theory of dreams. I have never claimed that every dream expressed the fulfilment of a *sexual* wish, and I have often asserted the contrary. But this produces no effect, and people continue to repeat the same thing.

With my cordial thanks and sincerest greetings,

Yours, Freud.'

It appears from Claparède's further comments on this letter that in his case, at all events, no effect was, in fact, produced.]

1 [Schiller, 'Die Weltweisen'.]

2 [See *Three Essays on the Theory of Sexuality* (1905*d*), *RSE*, 7, 183–4.]

processes of transformation in the sexual component drives may miscarry. The 'ego' feels threatened by the claims of the sexual drives and fends them off [*erwehrt*] by repressions; these, however, do not always have the desired result, but lead to the formation of dangerous substitutes [*Ersatzbildungen*] for the repressed and to burdensome reactions on the part of the ego. From these two classes of phenomena taken together there emerge what we call the symptoms of neuroses.

We have apparently digressed widely from our problem, though in doing so we have touched on the manner in which neurotic pathological conditions are related to our mental life as a whole. But let us now return to the narrower question. The sexual and ego drives alike have in general the same organs and systems of organs at their disposal. Sexual pleasure [216]
is not attached merely to the function of the genitals. The mouth serves for kissing as well as for eating and communication by speech; the eyes perceive not only alterations in the external world which are important for the preservation of life, but also characteristics of objects which lead to their being chosen as objects of love – their charms.[1] The saying that it is not easy for anyone to serve two masters is thus confirmed. The closer the relation into which an organ with a dual function of this kind enters with *one* of the major drives, the more it withholds itself from the other. This principle is bound to lead to pathological consequences if the two fundamental drives are disunited and if the ego maintains a repression of the sexual component drive concerned.[2] It is easy to apply this to the eye and to seeing. Let us suppose that the sexual component drive which makes use of looking – sexual pleasure in looking [scopophilia; *Schaulust*][T] – has drawn upon itself defensive action [*Gegenwehr*] by the ego drives in consequence of its excessive demands, so that the ideas in which its desires are expressed succumb to repression and are prevented from becoming conscious; in that case there will be a general disturbance of the relation of the eye and of the act of seeing to the ego and consciousness. The ego will have lost its dominance over the organ, which will now be wholly at the disposal of the repressed sexual drive. It looks as though the repression had been carried too far by the ego, as though it had emptied the baby out with the bathwater: the ego refuses to see anything at all any more, now that the sexual interest in seeing has made itself so prominent. But the alternative picture seems more to the point. This attributes the active role instead to the repressed

1 [In German, '*Reize*', which means both 'charms' and 'stimuli'. Cf. Freud's *Three Essays* (1905*d*), *RSE*, 7, 185.]

2 [This point had already been made at the end of the second of the *Three Essays* (1905*d*), ibid., 7, 181–2.]

pleasure in looking. The repressed drive takes its revenge for being held back from further psychical expansion, by becoming able to extend its dominance over the organ that is in its service. The loss of conscious dominance over the organ is the detrimental substitute for the repression which had miscarried and was only made possible at that price.

This relation of an organ with a double claim on it – its relation to the [217] conscious ego and to repressed sexuality – is to be seen even more clearly in motor organs than in the eye: as when, for instance, a hand which has tried to carry out an act of sexual aggression, and has become paralysed hysterically, is unable, after that act has been inhibited, to do anything else – as though it were obstinately insisting on carrying out a repressed innervation; or as when the fingers of people who have given up masturbation refuse to learn the delicate movements required for playing the piano or the violin. As regards the eye, we are in the habit of translating *Übersetzung* [*übersetzen*][T] the obscure psychical processes concerned in the repression of sexual scopophilia and in the development of the psychogenic disturbance of vision as though a punishing voice was speaking from within the subject, and saying: 'Because you sought to misuse your organ of sight for evil sensual pleasures, it is fitting that you should not see anything at all any more', and as though it was in this way approving the outcome of the process. The idea of talion punishment is involved in this, and in fact our explanation of psychogenic visual disturbance coincides with what is suggested by myths and legends. The beautiful legend of Lady Godiva tells how all the town's inhabitants hid behind their shuttered windows, so as to make easier the lady's task of riding naked through the streets in broad daylight, and how the only man who peeped through the shutters at her revealed loveliness was punished by going blind. Nor is this the only example which suggests that neurotic illness holds the hidden key to mythology as well.

Psychoanalysis is unjustly reproached, gentlemen, for leading to purely psychological theories of pathological problems. The emphasis which it lays on the pathogenic role of sexuality, which, after all, is certainly not an exclusively psychical factor, should alone protect it from this reproach. Psychoanalysts never forget that the mental is based on the organic, although their work can only carry them as far as this basis and not beyond it. Thus psychoanalysis is ready to admit, and indeed to postulate, that not all disturbances of vision need be psychogenic, like those that are evoked by the repression of erotic scopophilia. If an organ which serves the two sorts of drives increases its erotogenic role, it is in general to be expected that this will not occur without the excitability and

innervation of the organ undergoing changes which will manifest themselves as disturbances of its function in the service of the ego. Indeed, if [218]
we find that an organ normally serving the purpose of sense perception begins to behave like an actual genital when its erotogenic role is increased, we shall not regard it as improbable that *toxic* changes are also occurring in it. For lack of a better name we must retain the old unsuitable term of 'neurotic' disturbances for both classes of functional disturbances – those of physiological as well as those of toxic origin – which follow from an increase in the erotogenic factor. Generally speaking, the neurotic disturbances of vision stand in the same relation to the psychogenic ones as the 'actual neuroses' do to the psychoneuroses: psychogenic visual disturbances can no doubt hardly ever appear without neurotic ones, but the latter can appear without the former. These neurotic symptoms are unfortunately little appreciated and understood even today; for they are not directly accessible to psychoanalysis, and other methods of research have left the standpoint of sexuality out of account.[1]

Yet another line of thought extending into organic research branches off from psychoanalysis. We may ask ourselves whether the suppression of sexual component drives which is brought about by environmental influences is sufficient in itself to call up functional disturbances in organs, or whether special constitutional conditions must be present in order that the organs may be led to an exaggeration of their erotogenic role and consequently provoke repression of the drives. We should have to see in those conditions the constitutional part of the disposition to fall ill of psychogenic and neurotic disorders. This is the factor to which, as applied to hysteria, I gave the provisional name of 'somatic compliance'.[2]

1 [See some remarks on the 'actual neuroses' below, pp. 215–16.]

The present translation is a further revision of the one published in 1924.

The essential theme of this paper (published in December, 1910) had already been touched on by Freud some six years earlier in a lecture on psychotherapy (1905*a*), *RSE*, **7**, 271. Apart from its main theme, the paper is noteworthy for containing one of Freud's rare later allusions to the 'actual neuroses' coupled with a reminder of the importance of the distinction between anxiety neurosis and anxiety hysteria (p. 215 f. below).

'WILD' PSYCHOANALYSIS

A few days ago a middle-aged lady, under the protection of a female friend, called upon me for a consultation, complaining of anxiety states [*Angstzustände*][T]. She was in the second half of her forties, fairly well preserved, and had obviously not yet finished with her womanhood. The precipitating cause of the outbreak of her anxiety states had been a divorce from her last husband; but the anxiety had become considerably intensified, according to her account, since she had consulted a young physician in the suburb she lived in, for he had informed her that the cause of her anxiety was her lack of sexual satisfaction. He said that she could not tolerate the loss of intercourse with her husband, and so there were only three ways by which she could recover her health – she must either return to her husband, or take a lover, or obtain satisfaction from herself. Since then she had been convinced that she was incurable, for she would not return to her husband, and the other two alternatives were repugnant to her moral and religious feelings. She had come to me, however, because the doctor had said that this was a new discovery for which I was responsible, and that she had only to come and ask me to confirm what he said, and I should tell her that this and nothing else was the truth. The friend who was with her, an older, dried-up and unhealthy-looking woman, then implored me to assure the patient that the doctor was mistaken; it could not possibly be true, for she herself had been a widow for many years, and had nevertheless remained respectable without suffering from anxiety. [221] *Angst*

I will not dwell on the awkward predicament in which I was placed by this visit, but instead will consider the conduct of the practitioner who sent this lady to me. First, however, let us bear a reservation in mind which may possibly not be superfluous – indeed we will hope so. Long years of experience have taught me – as they could teach everyone else – not to accept straight away as true what patients, especially nervous patients, relate about their physician. Not only does a nerve specialist easily become the object of many of his patients' hostile feelings

[*Regungen*][T], whatever method of treatment he employs; he must also
[222] sometimes resign himself to accepting responsibility, by a kind of pro-
Verdrängung jection, for the buried repressed [*verdrängten*][T] wishes of his nervous patients.[I] It is a melancholy but significant fact that such accusations nowhere find credence more readily than among other physicians.

I therefore have reason to hope that this lady gave me a tendentiously distorted account of what her doctor had said, and that I do a man who is unknown to me an injustice by connecting my remarks about 'wild' psychoanalysis with this incident. But by doing so I may perhaps prevent others from doing harm to their patients.

Let us suppose, therefore, that her doctor spoke to the patient exactly as she reported. Everyone will at once bring up the criticism that if a physician thinks it necessary to discuss the question of sexuality with a woman he must do so with tact and consideration. Compliance with this demand, however, coincides with carrying out certain *technical rules* of psychoanalysis. Moreover, the physician in question was ignorant of a number of the *scientific theories* of psychoanalysis or had misapprehended them, and thus showed how little he had penetrated into an understanding of its nature and purposes.

Let us start with the latter, the *scientific* errors. The doctor's advice to the lady shows clearly in what sense he understands the expression 'sexual life' – in the popular sense, namely, in which by sexual needs nothing is meant but the need for coitus or analogous acts producing orgasm and emission of the sexual substances. He cannot have remained unaware, however, that psychoanalysis is commonly reproached with having extended the concept of what is sexual far beyond its usual range. The fact is undisputed; I shall not discuss here whether it may justly be used as a reproach. In psychoanalysis the concept of what is sexual comprises far more; it goes lower and also higher than its popular sense. This extension is justified genetically [*genetisch*][T]; we reckon as belonging to 'sexual life' all the activities of the tender feelings which have primitive sexual impulses [*Regungen*] as their source, even when those impulses have become inhibited [*Hemmung*][T] in regard to their original sexual aim or have exchanged this aim for another which is no longer sexual. For this
[223] reason we prefer to speak of *psychosexuality*, thus laying stress on the
Seele point that the mental [*seelischen*][T] factor in sexual life should not be overlooked or underestimated. We use the word 'sexuality' in the same comprehensive sense as that in which the German language uses the word *lieben* ['to love']. We have long known, too, that mental absence of

1 [An instance of this kind of projection can be found below on p. 225, Case B.]

satisfaction with all its consequences can exist where there is no lack of normal sexual intercourse; and as therapists we always bear in mind that the unsatisfied sexual trends (whose substitutive satisfactions in the form of nervous symptoms we combat) can often find only very inadequate outlet in coitus or other sexual acts.

Anyone not sharing this view of psychosexuality has no right to adduce psychoanalytic theses dealing with the aetiological importance of sexuality. By emphasizing exclusively the somatic factor in sexuality he undoubtedly simplifies the problem greatly, but he alone must bear the responsibility for what he does.

A second and equally gross misunderstanding is discernible behind the physician's advice.

It is true that psychoanalysis puts forward absence of sexual satisfaction as the cause of nervous disorders. But does it not say more than this? Is its teaching to be ignored as too complicated when it declares that nervous symptoms arise from a conflict between two forces [*Mächten*][T] – on the one hand, the libido (which has as a rule become excessive), and on the other, a rejection of sexuality, or a repression which is oversevere? No-one who remembers this second factor, which is by no means secondary in importance, can ever believe that sexual satisfaction in itself constitutes a remedy of general reliability for the sufferings of neurotics. A good number of these people are, indeed, either in their actual circumstances or in general incapable of satisfaction. If they were capable of it, if they were without their inner resistances, the strength of the drive [*Triebes*][T] itself would point the way to satisfaction for them even though no doctor advised it. What is the good, therefore, of medical advice such as that supposed to have been given to this lady?

Even if it could be justified scientifically, it is not advice that she can carry out. If she had had no inner resistances against masturbation or against a liaison she would, of course, have adopted one of these measures long before. Or does the physician think that a woman of over forty is unaware that one can take a lover, or does he overestimate his influence so much as to think that she could never decide upon such a step without medical approval? [224]

All this seems very clear, and yet it must be admitted that there is one factor which often makes it difficult to form a judgement. Some nervous states which we call the 'actual neuroses' ['*Aktualneurosen*'][T], such as typical neurasthenia and pure anxiety neurosis, obviously depend on the somatic factor in sexual life, while we have no certain picture as yet of

the part played in them by the psychical factor and by repression.[1] In such cases it is natural that the physician should first consider some 'actual' therapy, some alteration in the patient's somatic sexual activity, and he does so with perfect justification if his diagnosis is correct. The lady who consulted the young doctor complained chiefly of anxiety states, and so he probably assumed that she was suffering from an anxiety neurosis, and felt justified in recommending a somatic therapy to her. Again a convenient misapprehension! A person suffering from anxiety is not for that reason necessarily suffering from anxiety neurosis; such a diagnosis of it cannot be based on the name [of the symptom]; one has to know what signs constitute an anxiety neurosis, and be able to distinguish it from other pathological states which are also manifested by anxiety. My impression was that the lady in question was suffering from
[225] anxiety *hysteria*,[2] and the whole value of such nosographical distinctions, one which quite justifies them, lies in the fact that they indicate a different aetiology and a different treatment. No-one who took into consideration the possibility of anxiety hysteria in this case would have fallen into the error of neglecting the mental factors, as this physician did with his three alternatives.

Oddly enough, the three therapeutic alternatives of this so-called psychoanalyst leave no room for – psychoanalysis! This woman could apparently be cured of her anxiety only by returning to her husband, or by satisfying her needs by masturbation or with a lover. And where does analytic treatment come in, the treatment which we regard as the main remedy in anxiety states?

This brings us to the *technical* errors which are to be seen in the doctor's procedure in this alleged case.[3] It is a long superseded idea, and

1 [The 'actual neuroses' – conditions with a purely physical and contemporary causation – were much discussed by Freud during the Breuer period. (The term itself seems to appear first in his paper on 'Sexuality in the Aetiology of the Neuroses' (1898*a*), *RSE*, **3**, 265.) In his later writings they were not often mentioned – another incidental reference to them can be found above on p. 207 – apart from a longish passage in his contribution to a discussion on masturbation (1912*f*), ibid., **12**, 245, and another in Section II of his paper on narcissism (1914*c*), ibid., **14**, 72–3, in which (as in one or two other places) he suggested that hypochondria is to be regarded as a third 'actual neurosis' along with neurasthenia and anxiety neurosis. In the second section of his *Autobiographical Study* (1925*d*), ibid., **20**, 21–2, he commented on the fact that the topic had dropped out of sight, but asserted that he still thought that his earlier views on it were correct. A little later, indeed, he returned to a consideration of the subject at two or three points in *Inhibitions, Symptoms and Anxiety* (1926*d*), ibid., **20**, 125. See also Lecture XXIV of the *Introductory Lectures* (1916–17*a*), ibid., **16**, 339–45.]

2 [Anxiety hysteria had been introduced by Freud as a clinical entity not long before this, and had been explained by him in connection with the analysis of 'Little Hans' (1909*b*), ibid., **10**, 88 ff.]

3 [In the 1910 edition only the following sentence appears at this point: 'This may easily be attributed to his lack of knowledge.']

one derived from superficial appearances, that the patient suffers from a sort of ignorance, and that if one removes this ignorance by giving him information (about the causal connection of his illness with his life, about his experiences in childhood, and so on) he is bound to recover. The pathological factor is not his ignorance in itself, but the root of this ignorance in his *inner resistances*; it was they that first called this ignorance into being, and they still maintain it now. The task of the treatment lies in combating these resistances. Informing the patient of what he does not know because he has repressed it is only one of the necessary preliminaries to the treatment.[1] If knowledge about the unconscious were as important for the patient as people inexperienced in psychoanalysis imagine, listening to lectures or reading books would be enough to cure him. Such measures, however, have as much influence on the symptoms of nervous illness as a distribution of menu cards in a time of famine has upon hunger. The analogy goes even further than its immediate application; for informing the patient of his unconscious regularly results in an intensification of the conflict in him and an exacerbation of his troubles.

Since, however, psychoanalysis cannot dispense with giving this [226]
information, it lays down that this shall not be done before two conditions have been fulfilled. First, the patient must, through preparation, himself have reached the neighbourhood of what he has repressed, and secondly, he must have formed a sufficient attachment (*transference* [*Übertragung*][T]) to the physician for his emotional relationship to him to make a fresh flight impossible.

Only when these conditions have been fulfilled is it possible to recognize and to master the resistances which have led to the repression and the ignorance. Psychoanalytic intervention, therefore, absolutely requires a fairly long period of contact with the patient. Attempts to 'rush' him at first consultation, by brusquely telling him the secrets which have been discovered by the physician, are technically objectionable. And they mostly bring their own punishment by inspiring a hearty enmity towards the physician on the patient's part and cutting him off from having any further influence.

Besides all this, one may sometimes make a wrong surmise, and one is never in a position to discover the whole truth. Psychoanalysis provides these definite technical rules to replace the indefinable 'medical tact' which is looked upon as some special gift.

It is not enough, therefore, for a physician to know a few of the

1 [Cf. pp. 129–30 above and Editors' footnote 1.]

findings of psychoanalysis; he must also have familiarized himself with its technique if he wishes his medical procedure to be guided by a psychoanalytic point of view. This technique cannot yet be learnt from books, and it certainly cannot be discovered independently without great sacrifices of time, labour and success. Like other medical techniques, it is to be learnt from those who are already proficient in it. It is a matter of some significance, therefore, in forming a judgement on the incident which I took as a starting point for these remarks, that I am not acquainted with the physician who is said to have given the lady such advice and have never heard his name.

Neither I myself nor my friends and co-workers find it agreeable to claim a monopoly in this way in the use of a medical technique. But in the face of the dangers to patients and to the cause of psychoanalysis which are inherent in the practice that is to be foreseen of a 'wild' psychoanalysis, we have had no other choice. In the spring of 1910 we founded
[227] an International Psychoanalytical Association, to which its members declare their adherence by the publication of their names, in order to be able to repudiate responsibility for what is done by those who do not belong to us and yet call their medical procedure 'psychoanalysis'.[1] For as a matter of fact 'wild' analysts of this kind do more harm to the cause of psychoanalysis than to individual patients. I have often found that a clumsy procedure like this, even if at first it produced an exacerbation of the patient's condition, led to a recovery in the end. Not always, but still often. When he has abused the physician enough and feels far enough away from his influence, his symptoms give way, or he decides to take some step which leads along the path to recovery. The final improvement then comes about 'of itself', or is ascribed to some totally indifferent treatment by some other doctor to whom the patient has later turned. In the case of the lady whose complaint against her physician we have heard, I should say that, despite everything, the 'wild' psychoanalyst did more for her than some highly respected authority who might have told her she was suffering from a 'vasomotor neurosis'. He forced her attention to the real cause of her trouble, or in that direction, and in spite of all her opposition this intervention of his cannot be without some favourable results. But he has done himself harm and helped to intensify the prejudices which patients feel, owing to their natural affective resistances, against the methods of psychoanalysis. And this can be avoided.

1 [This Association had been founded at the Second Psychoanalytical Congress, at Nuremberg, at the end of March, 1910.]

CONTRIBUTIONS TO A DISCUSSION ON SUICIDE[1]

(1910)

I. INTRODUCTORY REMARKS

Gentlemen, you have all listened with much satisfaction to the plea put [231]
forward by an educationalist who will not allow an unjustified charge to be levelled against the institution that is so dear to him. But I know that in any case you were not inclined to give easy credence to the accusation that schools drive their pupils to suicide. Do not let us be carried too far, however, by our sympathy with the party which has been unjustly treated in this instance. Not all the arguments put forward by the opener of the discussion seem to me to hold water. If it is the case that youthful suicide occurs not only among pupils in secondary schools but also among apprentices and others, this fact does not acquit the secondary schools; it must perhaps be interpreted as meaning that as regards its pupils the secondary school takes the place of the traumas with which other adolescents meet in other walks of life. But a secondary school should achieve more than not driving its pupils to suicide. It should give them a desire to live and should offer them support and backing at a time of life at which the conditions of their development compel them to relax their ties with their parental home and their family. It seems to me indisputable that [232]
schools fail in this, and in many respects fall short of their duty of providing a substitute for the family and of arousing interest in life in

1 ['Zur Selbstmord-Diskussion.' First published in *Diskussionen des Wiener Psychoanalytischen Vereinigung*, **1** (1910) ('Über den Selbstmord, insbesondere den Schülerselbstmord [On Suicide, particularly among Schoolchildren]'), 19 and 59. Wiesbaden: Bergmann. Reprinted *GS*, **3** (1925), 321; *Neurosenlehre und Technik* (1931), 309; *GW*, **8** (1943), 62. The first translation into English by James Strachey was published in *SE*, **11** (1957), 231–2. The present translation is a slightly revised and corrected reprint of the *SE* version. – The discussion to which these are contributions took place in the Vienna Psychoanalytical Society on April 20 and 27, 1910. The proceedings had been opened with an address by a Latin scholar, a Professor Ernst Oppenheim, who appeared in the published version under the pseudonym of 'Unus Multorum'. He was in fact at that time a member of the Society and later collaborated with Freud in a paper on dreams in folklore (Freud, 1958*a* [1911]), *RSE*, **12**, 179 ff. The debate which followed was begun and ended by Freud. The report of only one other such discussion was similarly published – that on masturbation (1912*f*), ibid., **12**, 239 ff.]

the world outside.[1] This is not a suitable occasion for a criticism of secondary schools in their present shape; but perhaps I may emphasize a single point. The school must never forget that it has to deal with immature individuals who cannot be denied a right to linger at certain stages of development and even at certain disagreeable ones. The school must not take on itself the inexorable character of life: it must not seek to be more than a *game* of life.

II. CONCLUDING REMARKS

Gentlemen, I have an impression that, in spite of all the valuable material that has been brought before us in this discussion, we have not reached a decision on the problem that interests us. We were anxious above all to know how it becomes possible for the extraordinarily powerful life drive [*Lebenstrieb*][T] to be overcome: whether this can only come about with the help of a disappointed libido or whether the ego [*Ichs*][T] can renounce its self-preservation for its own egoistic motives [*Ichmotiven*][T]. It may be that we have failed to answer this psychological question because we have no adequate means of approaching it. We can, I think, only take as our starting point the condition of melancholia, which is so familiar to us clinically, and a comparison between it and the affect of mourning. The affective processes in melancholia, however, and the vicissitudes [*Schicksale*][T] undergone by the libido in that condition, are totally unknown to us. Nor have we arrived at a psychoanalytic understanding of the chronic affect of mourning. Let us suspend our judgement till experience has solved this problem.[2]

Motiv

1 [Some further remarks on the position of schools at this critical point in a child's development can be found in 'Some Reflections on Schoolboy Psychology' (1914*f*), *RSE*, **13**, 235 ff.]

2 [The comparison between mourning and melancholia forms, of course, the main basis of one of Freud's metapsychological papers (1916–17*g* [1915]), ibid., **14**, 217 ff., in which he also returns to the problem of suicide. The comparison had, in fact, already been indicated in a posthumously published memorandum written on May 31, 1897 (Freud, 1950*a*, Draft N), which can be found quoted in the Editors' Note to the metapsychological paper just mentioned.]

LETTER TO DR FRIEDRICH S. KRAUSS ON *ANTHROPOPHYTEIA*[1]

(1910)

My dear Dr Krauss, [233]

You have asked me what scientific value can in my opinion be claimed by collections of erotic jokes, witticisms, funny stories, etc. I know you have not felt any doubt of being able to justify the making of such collections. You merely wanted me to bear witness from the standpoint of a psychologist to the fact that material of this kind is not only useful but indispensable.

There are two points upon which I should principally like to insist. When all is said and done, the erotic quips and comic anecdotes that you have collected and published in *Anthropophyteia* have been produced and repeated only because they gave pleasure [*Lust*][T] both to their narrators and their hearers. It is not difficult to guess which components of the sexual drive [*Sexualtriebes*][T] (compounded as it is from so many elements) find satisfaction in this manner. These tales give us direct information as to which of the component drives of sexuality are retained in a given group of people as particularly efficient in producing pleasure; and in this way they give the neatest confirmation of the findings reached by the psychoanalytic examination of neurotics. Allow me to indicate the most important example of this kind. Psychoanalysis has led us to assert that the anal region – normally and not only in perverse individuals – is the site of an erotogenic sensitivity, and that in certain ways it behaves [234] exactly like a genital organ. Doctors and psychologists, when told of there being an anal erotism and an anal character derived from it, have

Trieb

1 ['Brief an Dr Friedrich S. Krauss über die *Anthropophyteia*.' First published *Anthropophyteia*, **7** (1910), 472. Reprinted *Sexual-Probleme*, **7** (1911), 73; *GS*, **11** (1928), 242; *Sexualtheorie und Traumlehre* (1931), 240; *GW*, **8** (1943), 224. This English translation by James Strachey (slightly revised) was first published in *SE*, **11** (1957), 233–5. – *Anthropophyteia* was a periodical, founded and edited by Dr F. S. Krauss, which dealt principally with anthropological material of a sexual character. Its first issue appeared in 1904 and thereafter one issue was published each year until the outbreak of the First World War in 1914, after which it seems to have ceased publication. In addition to its regular issues, a number of supplementary volumes appeared; and for one of these – a translation of J. G. Bourke's *Scatalogic Rites of All Nations* – Freud wrote a Preface (1913*k*), *RSE*, **12**, 335 ff. The paper on dreams in folklore (1958*a*), mentioned in the footnote on p. 221 above, includes many extracts from *Anthropophyteia*.]

been highly indignant. At this point *Anthropophyteia* comes to the help of psychoanalysis by showing how universally people dwell with pleasure upon this part of the body, its performances and indeed the product of its function. If this were not so, all these anecdotes would be bound to give rise to disgust in their hearers or else the whole mass of the population would have to be 'perverse' in the sense in which the word is used in works dealing with 'psychopathia sexualis' in a moralizing tone. It would not be hard to give other instances of how the material collected by the authors of *Anthropophyteia* has been of value for the researches of sexual psychology. Its value may even be increased, perhaps, by the circumstance (not in itself an advantage) that the collectors know nothing of the theoretical findings of psychoanalysis and have brought together the material without any guiding principles.

Another advantage of a wider character is presented in particular by erotic *jokes*, in the strict sense, just as it is by jokes in general. I have shown in my study of jokes [1905*c*] that the revelation of what is normally the repressed unconscious element in the mind can, under certain provisions, become a source of pleasure and thus a technique for the
Bildung construction of jokes [*Witzbildung*]T. In psychoanalysis today we describe a congeries of ideas and its associated affect as a 'complex'; and we are prepared to assert that many of the most admired jokes are 'complexive jokes' and that they owe their exhilarating and cheerful effect to the ingenious uncovering of what are as a rule repressed complexes. It would carry me too far afield if I were to bring forward instances here in proof of this thesis, but I can assert that the outcome of such an examination of the evidence is that the jokes, both erotic and of other sorts, which are in popular circulation provide an excellent auxiliary means of
Seele investigating the unconscious human mind [*Seelenlebens*]T – in the same way as do dreams, myths and legends, with the exploitation of which psychoanalysis is already actively engaged.

It is therefore safe to hope that the psychological importance of folk-
[235] lore will be more and more clearly recognized, and that the relations between that branch of study and psychoanalysis will soon become more intimate.

I remain, dear Dr Krauss, yours very sincerely,

FREUD

June 26, 1910

TWO INSTANCES OF PATHOGENIC PHANTASIES REVEALED BY THE PATIENTS THEMSELVES[1]

(1910)

A

A short while ago I saw a patient, about twenty years of age, who gave an [236]
unmistakable picture (confirmed by other opinions) of a dementia praecox (hebephrenia). During the initial stages of his illness he had exhibited periodic changes of mood and had made a considerable improvement. While he was in this favourable condition he was removed from the institution by his parents and for about a week he was regaled with entertainments of every kind to celebrate his supposed recovery. His relapse followed immediately upon this week of festivities. When he was brought back to the institution, he said that the consulting physician had advised him 'to flirt with his mother a little'. There can be no doubt that in this delusory paramnesia he was giving expression to the excitement which had been provoked in him by being in his mother's company and which had been the immediate provocation of his relapse.

B

More than ten years ago, at a time when the findings and hypotheses of psychoanalysis were known to only a few people, the following events were reported to me from a trustworthy source. A girl, who was the daughter of a medical man, fell ill of hysteria with local symptoms. Her father denied that it was hysteria and arranged for various somatic treatments to be initiated, which brought little improvement. One day a woman friend of the patient's said to her: 'Have you never thought of consulting Dr F.?' To which the patient replied: 'What good would that be? I know he'd say to me: "Have you ever had the idea of having sexual intercourse with your [237]
father?"' – It seems unnecessary for me to say explicitly that it has never been my practice and is not my practice today to ask such questions. But it is worth remarking that much of what patients report of the words and actions of their physicians may be understood as revelations of their own pathogenic phantasies.

1 ['Beispiele des Verrats pathogener Phantasien bei Neurotikern.' First published over the signature 'Dr Sigm. Freud', *Zbl. Psychoan.*, **1** (1910), 43; reprinted *GS*, **11** (1928), 300; *Neurosenlehre und Technik* (1931), 305; *GW*, **8**, 228. The present translation, by James Strachey, was first published in *SE*, **11** (1957), 236–7.]

REVIEW OF WILHELM NEUTRA'S *LETTERS TO NEUROTIC WOMEN*[1]

(1910)

[238] It should be taken as an encouraging sign of the awakening interest in psychotherapy that a second edition of this book has been called for so quickly. Unluckily we cannot hail the book itself as an encouraging phenomenon. The author, who is an assistant physician in the Gainfarn hydropathic institute near Vienna, has borrowed the form of Oppenheim's *Psychotherapeutische Briefe*[2] and has given that form a psychoanalytic content. This is in a sense ill-judged, since psychoanalysis cannot be satisfactorily combined with Oppenheim's (or, if that is preferred, Dubois'[3]) technique of 'persuasion'; it looks for its therapeutic results along quite other paths. What is more important, however, is the fact that the author fails to attain the merits of his model – tact and moral seriousness – and that in his presentation of psychoanalytic theory he often drops into empty rhetoric and is also guilty of some misstatements. Nevertheless, much of what he writes is neatly and aptly expressed; and the book may pass muster as a work for popular consumption. In a more serious, scientific exposition of the subject the author would have had to indicate the sources of his views and assertions with greater conscientiousness.

1 *Briefe an nervöse Frauen* by Dr Wilhelm Neutra. Second Thousand. Dresden and Leipzig: Minden, 1909. – [The German original appeared over the signature 'Freud' in *Zbl. Psychoan.*, **1** (1910), 49. It has been reprinted in *GW*, **Nachtr.** (1987), 500. The present translation, by James Strachey, is reprinted from *SE*, **11** (1957), 238.]

2 [Hermann Oppenheim (1906) – the celebrated neurologist.]

3 [Paul Dubois (1848–1918), Professor of Neuropathology in Bern, was well known in the early part of the century for his 'persuasion' treatment of the neuroses.]

REVIEW OF GREVE'S 'ON THE PSYCHOLOGY AND PSYCHOTHERAPY OF CERTAIN ANXIETY STATES'[1]

(1911)

The author, who attended this Congress as a delegate of the government of Chile, expounded the essential contents of the doctrine of repression [*Verdrängungslehre*][T] and the aetiological significance of the sexual factor for the neuroses in an unusually perspicacious and unerring manner. With dignified modesty, he reserves final judgement on the doctrine as a whole. His experience, he believes, does not permit him to say more because he has, as a rule, not carried analysis beyond the pubertal antecedents (*y aun cuando nos mostramos reservados para emitir una opinión propia, se nos ha de perdonar, ya que nuestra experiencia personal no alcanza a abarcar toda la latitud de sus doctrinas*).[2] *Verdrängung*

Yet numerous remarks leave no doubt about his own conviction. The existence of infantile sexuality appears to him to have been reliably proven by the investigations available to him (*demonstrada hasta la evidencia*).[3] He and others (*todos nosotros*)[4] have had opportunity to observe it [sexuality] in neurotic children in whom it manifests with certain excessive features. In a large number of cases, even an incomplete analytical treatment is sufficient to achieve considerable improvement of the general psychical condition, in that the patient regains his capacities even if the symptoms still persist to a limited degree. (. . . *para traer una notable mejoría del estado general psiquico del paciente, aun cuando puedan sequir persistiendo sintomas que, por su*

1 ['Sobre psicologia y psicoterapia de ciertos estados angustiosos', *Zbl. Psychoan.*, **1** (1911), 594. Reprinted in *GW*, **Nachtr.** (1987), 501 f. The present translation, by Mark Solms, is the first into English. This is a review of a lecture given before the Neurological Section of the International American (or rather: Inter-American) Congress for Medicine and Hygiene in Buenos Aires in May, 1910. It has previously, and inaccurately, been classed as an abstract of the lecture. As can be seen, it is rather more than that.

Freud was to cite Greve's lecture again three years later as evidence of the international spread of psychoanalysis in the years following 1907, when the schools of Vienna and Zürich were united. Cf. Freud (1914*d*), *RSE*, **14**, 26.]

2 ['and yet, when we are too reserved to express a personal opinion, we must be excused, as our own experience is insufficient to encompass the full extent of his doctrines.']

3 ['demonstrated by the evidence.']

4 ['all of us.']

poca acentuacion, no aparenten enfermedad y no lo inutilizen para la sociedad.)[1] (The reviewer would most especially like to emphasize what good understanding of neurotic illness is revealed here, by seeking the results of treatment, not in the removal of individual symptoms, but rather in the recovery of the capacity for living.) The author considers obsessional neurosis [*Zwangsneurose*][T] to be particularly amenable to analytical therapy. He managed, on one occasion, by means of two confidential discussions – which, together, took less than an hour – to remove obsessional ideas [*Zwangsideen*] which had stubbornly resisted every other form of treatment. The author invites his colleagues to give their full attention to the doctrines under discussion; they are based upon the most careful investigation and there is very much to be extracted from them which can be applied to the great benefit of their patients. (*Pero insisto ante vosotros, que de un atento estudio de las teorias de Freud, teorias basadas en la más escrupulosa y paciente observación de hechos clínicos que se pueda exigir, podreis cosechar mucho, muchísmo que puede favorecer a vuestros enfermos*.)[2]

We thank our (probably German) colleague in distant Chile for the impartial appreciation of psychoanalysis, and for the unexpected corroboration of its healing effects in foreign lands.

1 ['. . . in order to bring about considerable improvement in the general psychical condition of the patient, even though symptoms may persist which, because they are not very noticeable, do not suggest infirmity and do not render him useless to society.']

2 ['I stress to you that you stand to gain much, indeed very much, which could be of benefit to your patients from an attentive study of Freud's theories, theories based upon the most careful and patient observation of clinical facts that could possibly be expected.']

Daniel Paul Schreber

Daniel Paul Schreber

Jones (1955, 300–1) writes: 'He was an intelligent man of the highest character who had risen to the position of Senatspräsident in Saxony; this title, it may be remarked, had nothing to do with any political Senate, but meant that he was the presiding judge in a Division of an Appeal Court. The theory of the condition, however, was in no wise derived from this particular [autobiographical] study, but had been previously formulated by Freud from his clinical experience. The secret of paranoia he said [to Karl Abraham, in a letter dated March 3, 1911] he had learned from his friend Fliess.'

NOTE ON THE REVISED TRANSLATION

The translations in this *Revised Standard Edition* are supplemented by four sets of notes:

(1) Lengthy commentaries on the English renditions of technical terms that are considered controversial are provided in Volume 24. Usually at the first appearance of each such technical term in each text, but sometimes in other places where the issue seems relevant, the original German word is interpolated in square brackets and a superscript upper-case [T] indicates that the term is discussed in the 24th volume. There (on pp. 55–99) the commentaries appear, in alphabetical order, under the heading 'Notes on the Translation of Some Technical Terms'. If the technical term appears in a derivate form in the text, the root word (as it appears in Volume 24) is provided in the margin. For example, if the interpolated word is the derivative [*überträgt*], the root technical term *Übertragung* appears in the margin.

(2) Shorter commentaries on the English rendition of specific words or phrases appearing in particular places (as opposed to general technical terms) that have attracted comment in the secondary literature are also provided in Volume 24. These minor commentaries are distinguished from those concerning general technical terms by the use of a superscript lower-case [t] in the place where the controversial translation appears. The corresponding set of annotations appears on pp. 105–33 of Volume 24, in chronological order, under the heading 'Annotations to Individual Translations'.

(3) Further interpolations in the translations of German words in square brackets are provided *ad hoc*, without superscript letters, for reasons that should be self-explanatory in each instance. For example, if a technical term which was referenced and discussed in a Note in Volume 24 appears again shortly afterwards in a way that illuminates the points discussed there, then it is silently referenced again. Some of these interpolations might seem odd to German-speaking readers, since no attempt is made to 'adjust' Freud's grammar to conform with the English translation (see the Preface to the Revised Edition, *RSE*, **1**, xxvi *n*. 1). The words in square brackets interpolated in the text are always exactly what Freud wrote.

(4) In a good few places, commentaries (of both types 1 and 2) are also provided in the Editors' introductory notes, appendices and footnotes to the text itself. These are indexed in Volume 24, on pp. 601–6, under the heading 'Notes on Terms and Their Uses'. Such commentaries are usually reserved for matters of translation that are likely to be of interest or value to the general reader, as opposed to those with a special interest in such technical matters.

The pagination of the original *Standard Edition* is provided also in the margins, in square brackets, to assist cross-referencing.

For the reasons explained in the 'Preface to the Revised Edition' (*RSE*, **1**, xxix), all differences between the *SE* and *RSE* are identified through light underscoring of the text. This device was considered necessary to make readers aware of the subtle and pervasive revisions of the translations. The same applies to the revisions of the editorial apparatus. This underscoring will hopefully be removed in later editions of the *RSE*, once the revised edition has become established as the canonical one.

The overarching policy here has been to underscore all differences between the *SE* and *RSE*, with minimal exceptions, in order to ensure transparency. The three categories of exceptions (i.e. the differences that are *not* underscored) are (a) changes that are purely typographical and/or absolutely stereotyped across Volumes 1–23, (b) changes in the location of Freud texts within or between volumes, and (c) all the changes to Volume 24.

The rationale behind (a) is that we wanted to avoid any subjective judgements by the Editor of the *RSE* as to what is and what is not 'significant'. For example, some but not all readers might consider alterations to Strachey's spelling, grammar and punctuation to be trivial, but the potential significance – however subtle – varies with context. The rationale behind (b) is that these changes are indicated in the 'List of Relocated Freud Material in the Revised Edition', which is provided in Volume 24. These changes are also mentioned in the revised (and therefore underscored) editorial notes to the texts themselves. The rationale behind (c) is that the *RSE* version of Volume 24 is so utterly different from the *SE* version that readers can safely consider the volume as a whole to be new.

The following changes were deemed purely typographical and absolutely stereotyped, and are therefore exempted from underscoring:

(1) Changes in type-size, font and spacing (since they are objectively insignificant).

(2) The marginalia – including page numbers – and the superscript ^{T}s and ^{t}s (since they always represent changes).

(3) Changed page numbers in the cross-references and indexes (this follows logically from point 2).

(4) Altered footnote numbers (since new footnotes are always identified by the fact that the notes themselves are underscored, and the knock-on effects for numbering are objectively insignificant).

(5) Changes in running headings (since they repetitively echo changes that are underscored in the main body of text).

(6) Change from the singular possessive 'Editor's' to the plural 'Editors'' (since this applies throughout and follows logically from the fact that, unlike the *SE*, the *RSE* has two editors). In the few instances where the Editor is referred to in the singular, it is always clear from the context whether this means Strachey or Solms or, in the case of Freud (1985*a* [1915]), Grubrich-Simitis.

(7) This preliminary 'Note on the Revised Translation' (since it is obviously added; it applies only to the *RSE*).

(8) Captions to the illustrations (since they always represent changes).

(9) Changes in editorial style (since they are stereotyped and therefore need only be identified once, namely here):

- The word 'and' in two-author citations becomes '&', and a comma is inserted between author name/s and the publication date (e.g. Freud & Breuer, 1895*d*).
- Abbreviations of months (e.g. 'Oct.') and chapters ('Chap.') are spelt out ('October', 'Chapter').
- '*The*' is added to all editorial references to '*Interpretation of Dreams*'.
- Title abbreviations conform to modern usage (e.g. *G.W.* becomes *GW*).
- Punctuation is positioned inside closing quotation marks (e.g. 'The Latin word slipped your memory.').

(10) Modernized hyphenation of words is underscored, but not for those terms that occur very repetitively in the text (since they are stereotyped and the list is limited enough for readers to memorize). Here is the list, which implies also the plural and other grammatical forms of these terms:

anxiety-dream	*becomes*	anxiety dream
anxiety-hysteria	*becomes*	anxiety hysteria
day-dream	*becomes*	daydream
death-wish	*becomes*	death wish
dream-content	*becomes*	dream content
dream-interpretation	*becomes*	dream interpretation
dream-thought	*becomes*	dream thought
ego-cathexis	*becomes*	ego cathexis
ego-libido	*becomes*	ego libido
love-object	*becomes*	love object
object-cathexis	*becomes*	object cathexis
object-choice	*becomes*	object choice
object-libido	*becomes*	object libido
object-love	*becomes*	object love
object-presentation	*becomes*	object presentation
object-relation	*becomes*	object relation
psycho-analysis	*becomes*	psychoanalysis
sound-presentation	*becomes*	sound presentation
super-ego	*becomes*	superego
thing-presentation	*becomes*	thing presentation
to-day	*becomes*	today
wish-fulfilment	*becomes*	wish fulfilment
word-presentation	*becomes*	word presentation

PSYCHOANALYTIC NOTES ON AN AUTOBIOGRAPHICAL ACCOUNT OF A CASE OF PARANOIA (DEMENTIA PARANOIDES)

(1911 [1910])

EDITORS' NOTE

PSYCHOANALYTISCHE BEMERKUNGEN ÜBER EINEN AUTOBIOGRAPHISCH BESCHRIEBENEN FALL VON PARANOIA (DEMENTIA PARANOIDES)

GERMAN EDITIONS

1911 *Jb. psychoan. psychopath. Forsch.*, **3** (1), 9–68. ('Fall von Paranoia' only.) [3]
1912 'Nachtrag zu dem autobiographisch beschriebenen Fall von Paranoia (Dementia paranoides)', *Jb. psychoan. psychopath. Forsch.*, **3** (2), 588–90. ('Nachtrag' only.)
1913 *SKSN*, **3**, 198–270. (1921, 2nd ed.) ('Fall von Paranoia' with 'Nachtrag' in *SKSN* and all subsequent editions.)
1924 *GS*, **8**, 355–435.
1932 *Vier Krankengeschichten*, 377–463.
1943 *GW*, **8**, 240–320.
1973 *SA*, **7**, 139–200. (Revised reprint of the *GW* editions of both the case study and the 'Nachtrag'.)
1997 *Zwei Fallberichte*, Frankfurt, 95–169. (Further revised reprint.)

ENGLISH TRANSLATIONS

'Psycho-Analytic Notes upon an Autobiographical Account of a Case of Paranoia (Dementia Paranoides)'
1925 *CP*, **3**, 387–470. (Tr. Alix and James Strachey.) ('Case of Paranoia' with 'Postscript' in all English editions.)
1958 *SE*, **12**, 9–79. (Corrected reprint of the 1925 translation, with additional notes.)
1979 *PFL*, **9**, 131–223. (Reprint of the *SE* translation.)
'Psychoanalytic Remarks on an Autobiographically Described Case of Paranoia (Dementia Paranoides)'
2002 *PMC*, *The Schreber Case*, 1–70. (Tr. Andrew Webber.)

The present translation is a revised and corrected reprint of the *SE* version.

Schreber's *Memoirs* were published in 1903; but, though they had been widely discussed in psychiatric circles, they seem not to have attracted Freud's attention till the summer of 1910. He is known to have talked of them, and of the whole question of paranoia, during his Sicilian tour with Ferenczi in September of that year. On his

return to Vienna he began writing his paper, and letters dated December 16 to both Abraham and Ferenczi announced its completion. It seems not to have been
[4] published till the summer of 1911. The 'Postscript' was read before the Third International Psychoanalytical Congress (held at Weimar) on September 22, 1911, and was published at the beginning of the next year.

Freud had attacked the problem of paranoia at a very early stage of his researches into psychopathology. On January 24, 1895, some months before the publication of the *Studies on Hysteria*, he sent Fliess a long memorandum on the subject (Freud, 1950*a*, Draft H). This included a short case history and a theoretical discussion which aimed at establishing two main points: that paranoia is a neurosis of *defence* and that its chief mechanism is *projection*. Almost a year later (on January 1, 1896) he sent Fliess another, much shorter, note on paranoia; this formed part of a general account of the 'neuroses of defence' (ibid., Draft K), which he soon afterwards expanded into his second published paper bearing that title (1896*b*). In its published form, Section III of this paper included another and longer case history and was headed: 'Analysis of a Case of Chronic Paranoia' – a case for which Freud (in a footnote added nearly twenty years later) preferred the amended diagnosis of 'dementia paranoides'. As regards theory, this paper of 1896 added little to his earlier suggestions; but in a letter to Fliess not very long afterwards (December 9, 1899, Freud, 1950*a*, Letter 125) a somewhat cryptic paragraph occurs, which gives a hint of Freud's later views, including a suggestion that paranoia involves a return to an early auto-erotism. It can be found quoted in full in the Editors' Note to the paper on 'The Disposition to Obsessional Neurosis' in connection with the problem of 'choice of neurosis'. (See below, p. 310 f.)

Between the date of this last passage and the publication of the Schreber case history more than ten years elapsed with scarcely a mention of paranoia in Freud's published writings. We know, however, that on November 21, 1906, he presented a case of female paranoia before the Vienna Psychoanalytical Society. At that date he had apparently not yet arrived at what was to be his main generalization on the subject – namely, the connection between paranoia and repressed passive homosexuality. Nevertheless, only a little over a year later he was putting forward that hypothesis in letters to Jung (January 27, 1908) and Ferenczi (February 11, 1908), and
[5] was asking for and receiving their confirmation of it. More than three more years elapsed before the Schreber *Memoirs* offered him the opportunity of publishing his theory for the first time and of supporting it by a detailed account of his analysis of the unconscious processes at work in paranoia.

There are a number of references to that disease in Freud's later writings. The more important of these were his paper on 'A Case of Paranoia Running Counter to the Psychoanalytic Theory of the Disease' (1915*f*), *RSE*, **14**, and Section B of 'Some Neurotic Mechanisms in Jealousy, Paranoia and Homosexuality' (1922*b*), ibid., **18**. In addition, 'A Seventeenth-Century Demonological Neurosis' (1923*d*), ibid., **19**, includes some discussion of the Schreber case, though the neurosis which is the subject of the paper is nowhere described by Freud as paranoia. In none of these later writings is there any essential modification of the views on paranoia expressed in the present work.

The importance of the Schreber analysis, however, is by no means restricted to the light it throws on the problems of paranoia. Its third section, in particular, was, together with the simultaneously published short paper on the two principles of mental functioning (1911*b*), p. 215 ff. below, in many ways a forerunner of the metapsychological papers on which Freud embarked three or four years later. A number of subjects are touched upon which were to be discussed afterwards at greater length. Thus, the remarks on narcissism (p. 52 f.) were preliminary to the paper devoted to that subject (1914*c*), *RSE*, **14**, the account of the mechanism of repression (p. 58 f. below) was to be taken up again in the course of a few years (1915*d*), *RSE*, **14**, and the discussion of the drives (p. 64 f. below) was feeling its way towards the more elaborate one in 'Drives and their Vicissitudes' (1915*c*), *RSE*, **14**. The paragraph on projection (p. 57 below), on the other hand, was not, in spite of its promise, to find any sequel. Each of the two topics discussed in the later part of the paper, however – the various causes of the onset of neurosis (including the concept of 'frustration') and the part played by successive 'points of fixation' – was to be dealt with before long in a separate paper (1912*c*, p. 227 ff. below, and 1913*i*, p. 313 ff. below). Finally, in the postscript we find Freud's first brief excursion into the field of mythology and his first mention of totems, which were beginning to occupy his thoughts and which were to give the title to one of his principal works (1912–13*a*), *RSE*, **13**.

As Freud tells us (p. 40 *n.* 1 below), his case history makes use of only a single fact [6]
(Schreber's age at the time he fell ill) that was not contained in the *Memoirs*. We now possess, thanks to a paper written by Dr Franz Baumeyer (1956), a quantity of additional information. Dr Baumeyer was for some years (1946–9) in charge of a hospital near Dresden where he found a quantity of the original case records of Schreber's successive illnesses. He has summarized these records and quoted many of them in full. In addition to this he has collected a large number of facts concerning Schreber's family history and antecedents. W. G. Niederland (1959*a*, 1959*b*, 1960, 1963, 1968, 1972, 1974) has published further interesting information about Schreber's father; and some additional facts can be found in subsequent studies by Israëls (1989) and Lothane (1992). See also Santner (1996). Where any of this material seems to be directly relevant to Freud's paper, it can be found mentioned in the footnotes. Here it is only necessary to report the sequel to the history narrated in the *Memoirs*. After his discharge at the end of 1902, Schreber seems to have carried on an outwardly normal existence for some years. Then, in November, 1907, his wife had a stroke (though she lived until 1912). This seems to have precipitated a fresh onset of his illness, and he was readmitted – this time to an asylum in the Dösen district of Leipzig – a fortnight later.[1] He remained there in an extremely disordered and largely inaccessible state until his death, after gradual physical deterioration, in the spring of 1911 – only a short time before the publication of Freud's paper. The following chronological table, based on data derived partly from the *Memoirs* and partly from Baumeyer's material, may make the details in Freud's discussion and in the Editors' footnotes easier to disentangle.

1 It appears from a letter to Princess Marie Bonaparte, written by Freud on September 13, 1926, and published in part in the third volume of Ernest Jones's biography (1957, 477), that he had been informed of this relapse and its occasion (among other things) through a Dr Stegmann, though he made no mention of it in his paper. See footnotes, pp. 40 *n.* 1 and 44 f. *n.* 3 below.

1842 July 25. Daniel Paul Schreber born at Leipzig.
1861 November. Father died, aged 53.
1877 Elder brother (three years his senior) died, aged 38.
1878 Married.

First Illness

1884 Autumn. Stood as candidate for the Reichstag.[1]
[7] October. For some weeks in Sonnenstein Asylum.
December 8. Leipzig Psychiatric Clinic.
1885 June 1. Discharged.
1886 January 1. Took up appointment in Leipzig Landgericht.

Second Illness

1893 June. Informed of approaching appointment to Appeal Court.
October 1. Took up appointment as Presiding Judge.
November 21. Readmitted to Leipzig Clinic.
1894 June 14. Transferred to Lindenhof Asylum.
June 29. Transferred to Sonnenstein Asylum.
1900–2 Wrote *Memoirs* and took legal action for his discharge.
1902 July 14. Court judgment of discharge.
December 20. Discharged.
1903 *Memoirs* published.

Third Illness

1907 May. Mother died, aged 92.
November 14. Wife had stroke. Fell ill immediately afterwards.
November 27. Admitted to Asylum at Leipzig-Dösen.
1911 April 14. Died.
1912 May. Wife died, aged 54.

A note on the three mental hospitals referred to in various ways in the text may also be of help.

(1) Psychiatric Clinic (In-patient department) of the University of Leipzig. Director: Professor Flechsig.

(2) Schloss Sonnenstein. Saxon State Asylum at Pirna on the Elbe, 10 miles above Dresden. Director: Dr G. Weber.

(3) Lindenhof Private Asylum. Near Coswig, 11 miles NW of Dresden. Director: Dr Pierson.

An English translation of the *Denkwürdigkeiten* by Dr Ida Macalpine and Dr Richard A. Hunter was published in 1955 (London: William Dawson). For various reasons, some of which will be obvious to anyone comparing their version with

1 At this time Schreber was already filling an important judicial office, as judge presiding over the Landgericht (a court of inferior jurisdiction) at Chemnitz. After recovering from his first illness he occupied a similar position in the Landgericht in Leipzig. Just before his second illness he was appointed Presiding Judge over a Division of the Appeal Court in Dresden, Saxony.

ours, it has not been possible to make use of it for the many quotations from Schreber's book which occur in the case history. There are clearly special difficulties [8]
in translating the productions of schizophrenics, in which words, as Freud himself pointed out in his paper on 'The Unconscious' (*RSE*, **14**, 173 ff.), play such a dominating part. Here the translator is faced with the same problems that meet him so often in dreams, slips of the tongue and jokes. In all these cases the method adopted in the *Revised Standard Edition* is the pedestrian one of where necessary giving the original German words in footnotes and endeavouring by means of explanatory comments to allow an English reader some opportunity of forming an opinion of his own on the material. At the same time, it would be misleading to disregard outward forms entirely and to present through a purely literal translation an uncouth picture of Schreber's style. One of the remarkable features of the original is the contrast it perpetually offers between the involved and elaborate sentences of official academic nineteenth-century German and the *outré* extravagances of the psychotic events which they describe.

Throughout this paper figures in brackets with no preceding 'p.' are page references to the original German edition of Schreber's *Memoirs – Denkwürdigkeiten eines Nervenkranken*, Leipzig, Oswald Mutze. Figures in brackets *with* a preceding 'p.' are, as always in the *Revised Standard Edition*, references to pages in the present volume. Quotations from Schreber, as well as page references to the *Denkwürdigkeiten* and its appendices, have been compared with the original and, where necessary, corrected. These corrections have, however, only been indicated where they involve a change in meaning.

PSYCHOANALYTIC NOTES ON AN AUTOBIOGRAPHICAL ACCOUNT OF A CASE OF PARANOIA (DEMENTIA PARANOIDES)

[INTRODUCTION]

The analytic investigation of paranoia presents difficulties of a peculiar [9]
nature to physicians who, like myself, are not attached to public institutions. We cannot accept patients suffering from this complaint, or, at all events, we cannot keep them for long, since we cannot offer treatment unless there is some prospect of therapeutic success. It is only in exceptional circumstances, therefore, that I succeed in getting more than a superficial view of the structure of paranoia – when, for instance, the diagnosis (which is not always an easy matter) is uncertain enough to justify an attempt at influencing the patient, or when, in spite of an assured diagnosis, I yield to the entreaties of the patient's relatives and undertake to treat him for a time. Apart from this, of course, I see plenty of cases of paranoia and of dementia praecox, and I learn as much about them as other psychiatrists do about their cases; but that is not enough, as a rule, to lead to any analytic conclusions.

The psychoanalytic investigation of paranoia would be altogether impossible if the patients themselves did not possess the peculiarity of betraying (in a distorted form, it is true) precisely those things which other neurotics keep hidden as a secret. Since paranoics cannot be compelled to overcome their internal resistances, and since in any case they say only what they choose to say, it follows that this is precisely a disorder in which a written report or a printed case history can take the place of personal acquaintance with the patient. For this reason I think it is legitimate to base analytic interpretations upon the case history of a patient suffering from paranoia (or, more precisely, from dementia paranoides) whom I have never seen, but who has written his own case history and brought it before the public in print.

I refer to Dr jur. Daniel Paul Schreber, formerly Senatspräsident [10]
in Dresden,[1] whose book, *Denkwürdigkeiten eines Nervenkranken*

1 [A Senatspräsident in an Oberlandesgericht is the Judge presiding over a Division of an Appeal Court.]

[*Memoirs of a Nerve Patient*], was published in 1903, and, if I am rightly informed, aroused considerable interest among psychiatrists. It is possible that Dr Schreber may still be living today and that he may have dissociated himself so far from the delusional system which he put forward in 1903 as to be pained by these notes upon his book.[1] Insofar, however, as he still retains his identity with his former personality, I can rely upon the arguments with which he himself – 'a man of superior mental gifts and endowed with an unusual keenness alike of intellect and of observation'[2] – countered the efforts that were made to restrain him from publishing his memoirs: 'I have been at no pains', he writes, 'to close my eyes to the difficulties that would appear to lie in the path of publication, and in particular to the problem of paying due regard to the susceptibilities of certain persons still living. On the other hand, I am of the opinion that it might well be to the advantage both of science and of the recognition of religious truths if, during my lifetime, qualified authorities were enabled to undertake some examination of my body and to hold some inquiry into my personal experiences. To this consideration all feelings of a personal character must yield.'[3] He declares in another passage that he has decided to keep to his intention of publishing the book, even if the consequence were to be that his physician, Geheimrat Dr Flechsig of Leipzig,[4] brought an action against him. He urges upon Dr Flechsig, however, the same considerations that I am now urging upon him himself. 'I trust', he says, 'that even in the case of Geheimrat Prof. Dr Flechsig any personal susceptibilities that he may feel will be outweighed by a scientific interest in the subject matter of my memoirs.' [445–6.][5]

[11] Though all the passages from the *Denkwürdigkeiten* upon which my interpretations are based will be quoted verbatim in the following pages, I would ask my readers to make themselves acquainted with the book by reading it through at least once beforehand.

1 [Schreber in fact died on April 14, 1911, a few months after Freud wrote this case history (see pp. 3 f. and 6 above).]

2 This piece of self-portraiture, which is certainly not unjustified, can be found on page 35 of his book.

3 Preface [iii. Cf. end of footnote 2, p. 28 below].

4 [Paul Emil Flechsig (1847–1929), Professor of Psychiatry at Leipzig from 1877 to 1921, was celebrated for his work in neuroanatomy. Freud used Flechsig's myelogenetic method in his own neuroanatomical research (Freud, 1885*d*, 1886*b*, 1886*c*; see *RSE*, **3**, 14, and *NSW*, **1**).]

5 [A note on the system of page references adopted in the translation of the present paper can be found at the end of the Editors' Note, p. 7 above.]

I
CASE HISTORY

'I have suffered twice from nervous disorders', writes Dr Schreber, 'and [12]
each time as a result of mental overstrain. This was due on the first occasion to my standing as a candidate for election to the Reichstag while I was Landgerichtsdirektor[1] at Chemnitz, and on the second occasion to the very heavy burden of work that fell upon my shoulders when I entered on my new duties as Senatspräsident in the Oberlandesgericht in Dresden.' (34.)

Dr Schreber's first illness began in the autumn of 1884, and by the end of 1885 he had completely recovered. During this period he spent six months in Flechsig's clinic, and the latter, in a formal report which he drew up at a later date, described the disorder as an attack of severe hypochondria [379]. Dr Schreber assures us that this illness ran its course 'without the occurrence of any incidents bordering upon the sphere of the supernatural'. (35.)

Neither the patient's own account, nor the reports of the physicians which he reprinted at the end of his book,[2] tell us enough about his previous history or his personal circumstances. I am not even in a position to give the patient's age at the time of his illness,[3] though the high judicial position which he had attained before his second illness establishes some sort of lower limit. We learn that Dr Schreber had been married long before the time of his 'hypochondria'. 'The gratitude of my wife', he writes, 'was perhaps even more heartfelt; for she revered Professor Flechsig as the man who had restored her husband to her, and hence it was that for years she kept his portrait standing upon her writing table.' (36.) And in the same place: 'After my recovery from my first illness I spent eight years with my wife – years, upon the whole, of great [13]
happiness, rich in outward honours, and only clouded from time to time by the oft-repeated disappointment of our hope that we might be blessed with children.'

In June, 1893, he was notified of his prospective appointment as Senatspräsident, and he took up his duties on the first of October of the

1 [Judge presiding over an inferior court.]

2 [The Appendices to Schreber's book, covering nearly 140 pages, include three medico-legal Reports by Dr Weber (dated December, 1899, November, 1900, and April, 1902), Schreber's own Statement of his Case (July, 1901) and the court judgment of July, 1902.]

3 [He was, in fact, 42 at the time of his first illness (p. 6 above) and, as Freud himself tells us on p. 40 below, 51 at the time of his second.]

same year. Between these two dates[1] he had some dreams, though it was not until later that he came to attach any importance to them. He dreamt two or three times that his old nervous disorder had come back; and this made him as miserable in the dream as the discovery that it was only a dream made him happy when he woke up. Once, in the early hours of the morning, moreover, while he was in a state between sleeping and waking, the idea occurred to him 'that after all it really must be very nice to be a woman submitting to the act of copulation'. (36.) This idea was one which he would have rejected with the greatest indignation if he had been fully conscious.

The second illness set in at the end of October, 1893, with a torturing bout of sleeplessness. This forced him to return to the Flechsig clinic, where, however, his condition grew rapidly worse. The further course of the illness is described in a Report drawn up subsequently [in 1899] by the director of the Sonnenstein Asylum: 'At the commencement of his residence there[2] he expressed more hypochondriacal ideas, complained that he had softening of the brain, that he would soon be dead, etc. But ideas of persecution were already finding their way into the clinical picture, based upon sensory illusions which, however, seemed only to appear sporadically at first; while simultaneously a high degree of hyperaesthesia was observable – great sensitiveness to light and noise. – Later, the visual and auditory illusions became much more frequent, and, in conjunction with coenaesthetic disturbances, dominated the whole of his feeling and thought. He believed that he was dead and decomposing, that he was suffering from the plague; he asserted that his body was being handled in all kinds of revolting ways; and, as he himself declares to this day, he went through worse horrors than anyone could
[14] have imagined, and all on behalf of a holy purpose. The patient was so much preoccupied with these pathological experiences that he was inaccessible to any other impression and would sit perfectly rigid and motionless for hours (hallucinatory stupor). On the other hand, they tortured him to such a degree that he longed for death. He made repeated attempts at drowning himself in his bath, and asked to be given the "cyanide that was intended for him". His delusional ideas gradually assumed a mystical and religious character; he was in direct communication with God, he was the plaything of devils, he saw "miraculous apparitions", he heard "holy music", and in the end he even came to believe that he was living in another world.' (380.)

1 And therefore before he could have been affected by the overwork caused by his new post, to which he attributes his illness.

2 In Professor Flechsig's clinic at Leipzig. [See Editors' Note, p. 6 above.]

It may be added that there were certain people by whom he thought he was being persecuted and injured, and upon whom he poured abuse. The most prominent of these was his former physician, Flechsig, whom he called a 'soul murderer' [*Seelenmörder*]; and he used to call out over and over again: '*Little* Flechsig!' putting a sharp stress upon the first word (383). He was moved from Leipzig, and, after a short interval spent in another institution,[1] was brought in June, 1894, to the Sonnenstein Asylum, near Pirna, where he remained until his disorder assumed its final shape. In the course of the next few years the clinical picture altered in a manner which can best be described in the words of Dr Weber, the director of the asylum.[2]

'I need not enter any further into the details of the course of the disease. I must, however, draw attention to the manner in which, as time went on, the initial comparatively acute psychosis, which had directly involved the patient's entire mental life and deserved the name of "hallucinatory insanity", developed more and more clearly (one might almost say crystallized out) into the paranoic clinical picture that we have before us today.' (385.) The fact was that, on the one hand, he had developed an ingenious delusional structure, in which we have every reason to be interested, while, on the other hand, his personality had been reconstructed and now showed itself, except for a few isolated disturbances, capable of meeting the demands of everyday life.

Dr Weber, in his Report of 1899, makes the following remarks: 'It thus appears that at the present time, apart from certain obvious psychomotor symptoms which cannot fail to strike even the superficial observer as being pathological, Herr Senatspräsident Dr Schreber shows no signs of confusion or of psychical inhibition, nor is his intelligence noticeably impaired. His mind is collected, his memory is excellent, he has at his disposal a very considerable store of knowledge (not merely upon legal questions, but in many other fields), and he is able to reproduce it in a connected train of thought. He takes an interest in following events in the world of politics, science and art, etc., and is constantly occupied with such matters . . . and an observer who was uninstructed upon his general condition would scarcely notice anything peculiar in these directions. In spite of all this, however, the patient is full of ideas of pathological origin, which have formed themselves into a complete system; they are more or less fixed, and seem to be inaccessible to [15]

1 [Dr Pierson's private asylum at Lindenhof.]

2 [In his Report of July, 1899.]

correction by means of any objective appreciation and judgement of the external facts.' (385–6.)

Thus the patient's condition had undergone a great change, and he now considered himself capable of carrying on an independent existence. He accordingly took appropriate steps with a view to regaining control over his own affairs and to securing his discharge from the asylum. Dr Weber set himself to prevent the fulfilment of these intentions and drew up reports in opposition to them. Nevertheless, in his Report dated 1900, he felt obliged to give this appreciative account of the patient's character and conduct: 'Since for the last nine months Herr Präsident Schreber has taken his meals daily at my family board, I have had the most ample opportunities of conversing with him upon every imaginable topic. Whatever the subject was that came up for discussion (apart, of course, from his delusional ideas), whether it concerned events in the field of administration and law, of politics, art, literature or social life – in short, whatever the topic, Dr Schreber gave evidence of a lively interest, a well-informed mind, a good memory, and a sound judgement; his ethical outlook, moreover, was one which it was impossible not to endorse. So, too, in his lighter talk with the ladies of the party, he was both courteous and affable, and when he touched upon matters in a more humorous vein he invariably displayed tact and decorum. Never once, during these innocent talks round the dining table, did he introduce subjects which should more properly have been raised at a
[16] medical consultation.' (397–8.) Indeed, on one occasion during this period when a business question arose which involved the interests of his whole family, he entered into it in a manner which showed both his technical knowledge and his common sense (401 and 510).

In the numerous applications to the courts, by which Dr Schreber endeavoured to regain his liberty, he did not in the least disavow his delusions or make any secret of his intention of publishing the *Denkwürdigkeiten*. On the contrary, he dwelt upon the importance of his ideas to religious thought, and upon their invulnerability to the attacks of modern science; but at the same time he laid stress upon the 'absolute harmlessness' (430) of all the actions which, as he was aware, his delusions obliged him to perform. Such, indeed, were his acumen and the cogency of his logic that finally, and in spite of his being an acknowledged paranoic, his efforts were crowned with success. In July, 1902, Dr Schreber's civil rights were restored, and in the following year his *Denkwürdigkeiten eines Nervenkranken* appeared, though in a censored form and with many valuable portions omitted.

The Court Judgment that gave Dr Schreber back his liberty summarizes the content of his delusional system in a few sentences: 'He believed that he had a mission to redeem the world and to restore it to its lost state of bliss.[1] This, however, he could only bring about if he were first transformed from a man into a woman.' (475.)

For a more detailed account of his delusions as they appeared in their final shape we may turn to Dr Weber's Report of 1899: 'The culminating point of the patient's delusional system is his belief that he has a mission to redeem the world, and to restore mankind to their lost state of bliss. He was called to this task, so he asserts, by direct inspiration from God, just as we are taught that the Prophets were; for nerves in a condition of great excitement, as his were for a long time, have precisely the property of exerting an attraction upon God – though this is touching on matters which human speech is scarcely, if at all, capable of expressing, since they lie entirely outside the scope of human experience and, indeed, have been revealed to him alone. The most essential part of his mission of redemption is that it must be preceded by his *transformation into a* [17]
woman. It is not to be supposed that he *wishes* to be transformed into a woman; it is rather a question of a "must" based upon the Order of Things [*Weltordnung*], which there is no possibility of his evading, much as he would personally prefer to remain in his own honourable and masculine station in life. But neither he nor the rest of mankind can regain the life beyond except by his being transformed into a woman (a process which may occupy many years or even decades) by means of divine miracles. He himself, of this he is convinced, is the only object upon which divine miracles are worked, and he is thus the most remarkable human being who has ever lived upon earth. Every hour and every minute for years he has experienced these miracles in his body, and he has had them confirmed by the voices that have conversed with him. During the first years of his illness certain of his bodily organs suffered such destructive injuries as would inevitably have led to the death of any other man: he lived for a long time without a stomach, without intestines, almost without lungs, with a torn oesophagus, without a bladder, and with shattered ribs, he used sometimes to swallow part of his own larynx with his food, etc. But divine miracles ("rays") always restored what had been destroyed, and therefore, as long as he remains a man, he is altogether immortal. These alarming phenomena have ceased long ago, and his "femaleness" has become prominent instead. This is a matter of a process of development which will probably require decades, if

1 [See footnote 1, p. 21 below.]

not centuries, for its completion, and it is unlikely that anyone now living will survive to see the end of it. He has a feeling that enormous numbers of "female nerves" have already passed over into his body, and out of them a new race of men will proceed, through a process of direct impregnation by God. Not until then, it seems, will he be able to die a natural death, and, along with the rest of mankind, will he regain a state of bliss. In the meantime, not only the sun, but trees and birds, which are in the nature of "bemiracled residues of former human souls", speak to him in human accents, and miraculous things happen everywhere around him.' (386–8.)

Bildung The interest felt by the practical psychiatrist in such delusional formations [*Wahnbildungen*]^{T} as these is, as a rule, exhausted when once he has ascertained the character of the products of the delusion and has [18] formed an estimate of their influence on the patient's general behaviour: in his case marvelling is not the beginning of understanding. The psychoanalyst, in the light of his knowledge of the psychoneuroses, approaches the subject with a suspicion that even thought structures [*Gedankenbildungen*] so extraordinary as these and so remote from our common modes of thinking are nevertheless derived from the most general and comprehensible impulses [*Regungen*]^{T} of the human mind *Seele* [*des Seelenlebens*]^{T}; and he would be glad to discover the motives of such a transformation as well as the manner in which it has been accomplished. With this aim in view, he will wish to go more deeply into the details of the delusion and into the history of its development.

(*a*) The medical officer lays stress upon two points as being of chief importance: the patient's *assumption of the role of Redeemer*, and his *transformation into a woman*. The Redeemer delusion is a phantasy that is familiar to us through the frequency with which it forms the nucleus of religious paranoia. The additional factor, which makes the redemption dependent upon the man being previously transformed into a woman, is unusual and in itself bewildering, since it shows such a wide divergence from the historical myth which the patient's phantasy is setting out to reproduce. It is natural to follow the medical report in assuming that the driving force [*das Treibende*] of this delusional complex was the patient's ambition to play the part of Redeemer, and that his *emasculation* was only entitled to be regarded as a means for achieving that end. Even though this may appear to be true of his delusion in its final form, a study of the *Denkwürdigkeiten* compels us to take a very different view [*Auffassung*]^{T} of the matter. For we learn that the idea of being

transformed into a woman (that is, of being emasculated) was the primary delusion, that he began by regarding that act as constituting a serious injury and persecution, and that it became related to his playing the part of Redeemer in only a secondary way. There can be no doubt, moreover, that originally he believed that the transformation was to be effected for the purpose of sexual abuse and not so as to serve higher designs. The position may be formulated by saying that a sexual delusion of persecution was later on [*nachträglich*][T] converted in the patient's mind into a religious delusion of grandeur. The part of persecutor was at first assigned to Professor Flechsig, the physician in whose charge he was; later, his place was taken by God Himself. *Nachträglichkeit*

I will quote the relevant passages from the *Denkwürdigkeiten* in full: [19] 'In this way a conspiracy against me was brought to a head (in about March or April, 1894). Its object was to contrive that, when once my nervous complaint had been recognized as incurable or assumed to be so, I should be handed over to a certain person in a particular manner: my soul [*Seele*] was to be delivered up to him, but my body – owing to a misapprehension of what I have described above as the purpose underlying the Order of Things – was to be transformed into a female body, and as such surrendered to the person in question[1] with a view to sexual abuse, and was then simply to be "left on one side" – that is to say, no doubt, given over to corruption.' (56.)

'It was, moreover, perfectly natural that from the human standpoint (which was the one by which at that time I was still chiefly governed) I should regard Professor Flechsig or his soul as my only true enemy – at a later date there was also the von W. soul, about which I shall have more to say presently – and that I should look upon God Almighty as my natural ally. I merely fancied that He was in great straits as regards Professor Flechsig, and consequently felt myself bound to support Him by every conceivable means, even to the length of sacrificing myself. It was not until very much later that the idea forced itself upon me that God Himself had played the part of accomplice, if not of instigator, in the plot whereby my soul was to be murdered and my body used like a strumpet. I may say, in fact, that this idea has in part become clearly conscious to me only in the course of writing the present work.' (59.)

'Every attempt at murdering my soul, or at emasculating me for purposes *contrary to the Order of Things* (that is, for the gratification of the sexual appetites of a human individual), or later at destroying my

1 It is shown from the context in this and other passages that 'the person in question' who was to practise this abuse was none other than Flechsig. (See below [p. 33 ff.].)

understanding – every such attempt has come to nothing. From this apparently unequal struggle between one weak man and God Himself, I have emerged as the victor – though not without undergoing much bitter suffering and privation – because the Order of Things stands upon my side.' (61.)

In a footnote attached to the words '*contrary to the Order of Things*' [20] in the above passage, the author foreshadows the subsequent transformation in his delusion of emasculation and in his relation to God: 'I shall show later on that emasculation for quite another purpose – a purpose *in consonance with the Order of Things* – is within the bounds of possibility, and, indeed, that it may quite probably afford the solution to the conflict.'

These statements are of decisive importance in determining the view we are to take of the delusion of emasculation and in thus giving us a general understanding of the case. It may be added that the 'voices' which the patient heard never treated his transformation into a woman as anything but a sexual disgrace, which gave them an excuse for jeering at him. 'Rays of God[1] not infrequently thought themselves entitled to mock at me by calling me "Miss[2] Schreber", in allusion to the emasculation which, it was alleged, I was about to undergo.' (127.) Or they would say: 'So *this* sets up to have been a Senatspräsident, this person who lets himself be f—d![3] Or again: 'Don't you feel ashamed in front of your wife?' [177.]

That the emasculation phantasy was of a primary nature and originally independent of the Redeemer motif becomes still more probable when we recollect the 'idea' [*Vorstellung*][T] which, as I mentioned on an earlier page [p. 12], occurred to him while he was half-asleep, to the effect that it must be nice to be a woman submitting to the act of copulation (36). This phantasy appeared during the incubation period of his illness, and before he had begun to feel the effects of overwork in Dresden.

Schreber himself gives the month of November, 1895, as the date at which the connection was established between the emasculation phantasy and the Redeemer idea and the way thus paved for his becoming reconciled to the former. 'Now, however,' he writes, 'I became clearly aware that the Order of Things imperatively demanded my

1 The 'rays of God', as we shall see [p. 21 below], are identical to the voices which talked the 'basic language'.

2 [In English in the original.]

3 I reproduce this omission from the *Denkwürdigkeiten*, just as I do all the peculiarities of their author's way of writing. I myself should have found no reason for being so shamefaced over a serious matter.

emasculation, whether or not I personally liked it, and that no *reasonable* course lay open to me but to reconcile myself to the thought of being transformed into a woman. The further consequence of my emasculation could, of course, only be my impregnation by divine rays to the end [21] that a new race of men might be created.' (177.)

The idea of being transformed into a woman was the salient feature and the earliest germ of his delusional system. It also proved to be the one part of it that persisted after his cure, and the one part that was able to retain a place in his behaviour in real life after he had recovered. 'The *only thing* which could appear unreasonable in the eyes of other people is the fact, already touched upon in the expert's report, that I am sometimes to be found standing before the mirror or elsewhere, with the upper portion of my body bared, and wearing sundry feminine adornments, such as ribbons, false necklaces, and the like. This only occurs, I may add, when I am *by myself*, and never, at least so far as I am able to avoid it, in the presence of other people.' (429.) The Herr Senatspräsident confesses to this frivolity at a date (July, 1901)[1] at which he was already in a position to express very aptly the completeness of his recovery in the region of practical life: 'I have now long been aware that the persons I see about me are not "cursorily improvised men" but real people, and that I must therefore behave towards them as a reasonable man is used to behave towards his fellows.' (409.) In contrast to the way in which he put his emasculation phantasy into action, the patient never took any steps towards inducing people to recognize his mission as Redeemer, beyond the publication of his *Denkwürdigkeiten*.

(*b*) The attitude of our patient towards *God* is so singular and so full of internal contradictions that it requires more than a little faith to persist in the belief that there is nevertheless 'method' in his 'madness'. With the help of what Dr Schreber tells us in the *Denkwürdigkeiten*, we must now endeavour to arrive at a more exact view of his theologico-psychological system, and we must expound his opinions concerning *nerves*, *the state of bliss*, *the divine hierarchy*, and *the attributes of God*, in their manifest (delusional) nexus. At every point in his theory we shall be struck by the astonishing mixture of the commonplace and the clever, of what has been borrowed and what is original.

1 [In his Statement of his Case (see footnote 2, p. 11 above).]

[22] The human soul[1] is comprised in the *nerves* of the body. These are to be conceived of as structures of extraordinary fineness, comparable to the finest thread. Some of these nerves are suited only for the reception of sense perceptions, while others (*the nerves of understanding*) carry out all the psychical functions; and in this connection it is to be noticed that *each single nerve of understanding represents a person's entire mental* [*geistige*] *individuality*, and that the presence of a greater or lesser number of nerves of understanding has no influence except upon the length of time during which the mind can retain its impressions.[2]

Whereas men consist of bodies and nerves, God is from His very nature nothing but nerve. But the nerves of God are not, as is the case with human bodies, present in limited numbers, but are infinite or eternal. They possess all the properties of human nerves to an enormously intensified degree. In their creative capacity – that is, their power of turning themselves into every imaginable object in the created world – they are known as *rays*. There is an intimate relation between God and the starry heaven and the sun.[3]

When the work of creation was finished, God withdrew to an immense distance (10–11 and 252) and, in general, resigned the world to its own laws. He limited His activities to drawing up to Himself the souls of the dead. It was only in exceptional instances that He would enter into relations with particular, highly gifted persons,[4] or would intervene by means of a miracle in the destinies of the world. God does not have any
[23] regular communication with human souls, in accordance with the Order of Things, till after death.[5] When a man dies, his spiritual parts[6] (that is, his nerves) undergo a process of purification before being finally

1 ['*Seele*.' When used adjectively, in this sense, the term is translated 'spiritual' in the present work. See, for instance, this page, '*Seelenteile*', 'spiritual parts'. At other times the sense demands 'mind' and 'mental'. For a full discussion of the translation of '*Seele*', see *RSE*, **24**, 82–4.]

2 The words in which Schreber states this theory are italicized by him, and he adds a footnote, in which he insists that it can be used as an explanation of heredity: 'The male semen', he declares, 'contains a nerve belonging to the father, and it unites with a nerve taken from the mother's body to form a new entity.' (7.) Here, therefore, we find a quality properly belonging to the spermatozoon transferred on to the nerves, which makes it probable that Schreber's 'nerves' are derived from the sphere of ideas connected with sexuality. It not infrequently happens in the *Denkwürdigkeiten* that an incidental note upon some piece of delusional theory gives us the desired indication of the genesis of the delusion and so of its meaning. [Cf. below, p. 31 f.]

3 In this connection see my discussion below on the significance of the sun [p. 46 ff.]. – The comparison between (or rather the condensation [*Verdichtung*][T] of) nerves and rays may well have been based on the linear extension which they have in common. – The ray-nerves, by the way, are no less creative than the spermatozoon-nerves.

4 In the 'basic language' (see below [p. 21]) this is described as 'making a nerve connection with them'.

5 We shall find later [p. 22 ff.] that certain criticisms against God are based on this fact.

6 [See footnote 1 above.]

reunited with God Himself as 'forecourts of Heaven'. Thus it comes about that everything moves in an eternal round, which lies at the basis of the Order of Things. In creating anything, God is parting with a portion of Himself, or is giving a portion of His nerves a different shape. The apparent loss which He thus sustains is made good when, after hundreds and thousands of years, the nerves of dead men, that have entered the state of bliss, once more accrue to Him as 'forecourts of Heaven' (18 and 19 *n.*).

Souls that have passed through the process of purification enter into the enjoyment of a *state of bliss*.[1] In the meantime they have lost some of their individual consciousness, and have become fused together with other souls into higher unities. Important souls, such as those of men like Goethe, Bismarck, etc., may have to retain their sense of identity for hundreds of years to come, before they too can become resolved into higher soul-complexes, such as 'Jehovah rays' in the case of ancient Jewry, or 'Zoroaster rays' in the case of ancient Persia. In the course of their purification 'souls learn the language which is spoken by God Himself, the so-called "basic language", a vigorous though somewhat antiquated German, which is especially characterized by its great wealth of euphemisms'[2] (13).

God Himself is not a simple entity. 'Above the "forecourts of Heaven" hovered God Himself, who, in contradistinction to these "anterior [24]
realms of God", was also described as the "posterior realms of God". The posterior realms of God were, and still are, divided in a strange manner into two parts, so that a lower God (Ahriman) was differentiated from an upper God (Ormuzd).' (19.) As regards the significance of this division Schreber can tell us no more than that the lower God was more especially attached to the peoples of a dark race (the Semites) and the upper God to those of a fair race (the Ayrans); nor would it be reasonable, in such sublime matters, to expect more of human knowledge. Nevertheless, we are also told that 'in spite of the fact that in certain respects God Almighty forms a unity, the lower and the upper God must be regarded as separate Beings, each of which possesses its own particular egoism [*Egoismus*] and its own particular self-preservative drive

1 This consists essentially in a feeling of voluptuousness (see below [p. 26]). [The German word here translated 'state of bliss' is '*Seligkeit*', literally 'state of being blessed (*selig*)'. '*Selig*' is used in various senses – 'blessed', 'blissful' and also, euphemistically, 'dead'. (See Freud's footnote 2, p. 27 below.)]

2 On one single occasion during his illness the patient was vouchsafed the privilege of seeing, with his spiritual eyes, God Almighty clear and undisguised before him. On that occasion God uttered what was a very current word in the basic language, and a forcible though not an amiable one – the word 'Slut!' (136). [In German '*Luder*'. This term of abuse is occasionally applied to males, though much more often to females. – Freud returns to a discussion of the 'basic language' at the end of Lecture X in his *Introductory Lectures* (1916–17*a*), *RSE*, **15**, 145.]

[*Selbsterhaltungstrieb*][T], *even in relation to the other*, and each of which is therefore constantly endeavouring to thrust itself in front of the other' (140 *n*.). Moreover, the two divine Beings behaved in quite different ways towards the unlucky Schreber during the acute stage of his illness.[1]

In the days before his illness Senatspräsident Schreber had been a doubter in religious matters (29 and 64); he had never been able to persuade himself into a firm belief in the existence of a personal God. Indeed, he adduces this fact about his earlier life as an argument in favour of the complete reality of his delusions.[2] But anyone who reads the account which follows of the character traits of Schreber's God will have to allow that the transformation effected by the paranoic disorder was no very fundamental one, and that in the Redeemer of today much remains of the doubter of yesterday.

[25] For there is a flaw in the Order of Things, as a result of which the existence of God Himself seems to be endangered. Owing to circumstances which are incapable of further explanation, the nerves of *living* men, especially when in a condition of *intense excitement*, may exercise such a powerful attraction upon the nerves of God that He cannot get free from them again, and thus His own existence may be threatened (11). This exceedingly rare occurrence took place in Schreber's case and involved him in the greatest sufferings. The self-preservative drive was aroused in God (30), and it then became evident that God was far removed from the perfection ascribed to him by religions. Through the whole of Schreber's book there runs the bitter complaint that God, being only accustomed to communication with the dead, *does not understand living men*.

'In this connection, however, a *fundamental misunderstanding* prevails, which has since run through my whole life like a scarlet thread. It is based precisely upon the fact that, *in accordance with the Order of Things, God really knew nothing about living men* and did not need to know; consonantly with the Order of Things, He needed only to have communication with corpses.' (55.) – 'This state of things . . . I am convinced, is once more to be brought into connection with the fact that

1 A footnote on page 20 leads us to suppose that a passage in Byron's *Manfred* may have determined Schreber's choice of the names of Persian divinities. We shall later come upon further evidence of the influence of this poem on him. [p. 39 below.]

2 'That it was simply a matter of illusions seems to me to be *in my case*, from the very nature of things, psychologically unthinkable. For illusions of holding communication with God or with departed souls can properly only arise in persons who, before falling into their condition of pathological nervous excitement, already have a firm belief in God and in the immortality of the soul. *This was not by any means so, however, in my case, as has been explained at the beginning of this chapter.*' (79.)

God was, if I may so express it, quite incapable of dealing with living men, and was only accustomed to communicate with corpses, or at most with men as they lay asleep (that is, in their dreams).' (141.) – 'I myself feel inclined to exclaim: "*Incredibile scriptu!*" Yet it is all literally true, however difficult it may be for other people to grasp the idea of God's complete inability to judge living men correctly, and however long I myself took to accustom myself to this idea after my innumerable observations upon the subject.' (246.)

But as a result of God's misunderstanding of living men it was possible for Him Himself to become the instigator of the plot against Schreber, to take him for an idiot, and to subject him to these severe ordeals (264). To avoid being set down as an idiot, he submitted himself to an extremely burdensome system of 'enforced thinking' [*Denkzwange*][T]. For 'every time that my intellectual activities ceased, God jumped to the conclusion that my mental faculties were extinct and that the destruction of my understanding (the idiocy), for which He was hoping, had actually set in, and that a withdrawal had now become possible' (206). *Zwang*

The behaviour of God in the matter of the urge to evacuate (or 'sh—') rouses him to a specially high pitch of indignation. The passage is so characteristic that I will quote it in full. But to make it clear I must first explain that both the miracles and the voices proceed from God, that is, from the divine rays. [26]

'Although it will necessitate my touching upon an unsavoury subject, I must devote a few more words to the question that I have just quoted ("Why don't you sh—?") on account of the typical character of the whole business. The need for evacuation, like all else that has to do with my body, is evoked by a miracle. It is brought about by my faeces being forced forwards (and sometimes backwards again) in my intestines; and if, owing to there having already been an evacuation, enough material is not present, then such small remains as there may still be of the contents of my intestines are smeared over my anal orifice. This occurrence is a miracle performed by the upper God, and it is repeated several dozens of times at the least every day. It is associated with an idea which is utterly incomprehensible to human beings and can only be accounted for by God's complete ignorance of living man as an organism. According to this idea "sh—ing" is in a certain sense the final act; that is to say, when once the urge to sh— has been miracled up, the aim of destroying the understanding is achieved and a final withdrawal of the rays becomes possible. To get to the bottom of the origin of this idea, we must suppose, as it seems to me, that there is a misapprehension in connection with the

symbolic meaning of the act of evacuation, a notion, in fact, that anyone who has been in such a relation as I have with divine rays is to some extent entitled to sh— upon the whole world.

'But now what follows reveals the full perfidy[1] of the policy that has been pursued towards me. Almost every time the need for evacuation was miracled up in me, some other person in my vicinity was sent (by having his nerves stimulated for that purpose) to the lavatory, in order to prevent my evacuating. This is a phenomenon which I have observed for years and upon such countless occasions – thousands of them – and with such regularity, as to exclude any possibility of its being attributable to chance. And thereupon comes the question: "Why don't you sh—?" to
[27] which the brilliant repartee is made that I am "so stupid or something". The pen well nigh shrinks from recording so monumental a piece of absurdity as that God, blinded by His ignorance of human nature, can positively go to such lengths as to suppose that there can exist a man too stupid to do what every animal can do – too stupid to be able to sh—. When, upon the occasion of such an urge, I actually succeed in evacuating – and as a rule, since I nearly always find the lavatory engaged, I use a pail for the purpose – the process is always accompanied by the generation of an exceedingly strong feeling of spiritual voluptuousness. For the relief from the pressure caused by the presence of the faeces in the intestines produces a sense of intense well-being in the nerves of voluptuousness; and the same is equally true of making water. For this reason, even down to the present day, while I am passing stool or making water, all the rays are always without exception united; for this very reason, whenever I address myself to these natural functions, an attempt is invariably made, though as a rule in vain, to miracle backwards the urge to pass stool and to make water.'[2] (225–7.)

Furthermore, this singular God of Schreber's is incapable of learning anything by experience: 'Owing to some quality or other inherent in his nature, it seems to be impossible for God to derive any lessons for the future from the experience thus gained.' (186.) He can therefore go on repeating the same tormenting ordeals and miracles and voices, without alteration, year after year, until He inevitably becomes a laughing stock to the victim of His persecutions.

'The consequence is that, now that the miracles have to a great extent

1 In a footnote at this point the author endeavours to mitigate the harshness of the word 'perfidy' by a reference to one of his arguments in justification of God. These will be discussed presently [p. 25 below].

2 This confession to a pleasure in the excretory processes, which we have learnt to recognize as one of the auto-erotic components of infantile sexuality, may be compared with the remarks made by Little Hans in my 'Analysis of a Phobia in a Five-Year-Old Boy' (1909*b*) [*RSE*, **10**, 74 f.].

lost the power which they formerly possessed of producing terrifying effects, God strikes me above all, in almost everything that happens to me, as being ridiculous or childish. As regards my own behaviour, this often results in my being obliged in self-defence to play the part of a scoffer at God, and even, on occasion, to scoff at Him aloud.' (333.)[1]

This critical and rebellious attitude towards God is, however, opposed [28] in Schreber's mind by an energetic counter-current, which finds expression in many places: 'But here again I must most emphatically declare that this is nothing more than an episode, which will, I hope, terminate at the latest with my decease, and that the right of scoffing at God belongs in consequence to me alone and not to other men. For them He remains the almighty creator of Heaven and earth, the first cause of all things, and the salvation of their future, to whom – notwithstanding that a few of the conventional religious ideas may require revision – worship and the deepest reverence are due.' (333–4.)

Repeated attempts are therefore made to find a justification for God's behaviour to the patient. In these attempts, which display as much ingenuity as every other theodicy, the explanation is based now upon the general nature of souls, and now upon the necessity for self-preservation under which God lay, and upon the misleading influence of the Flechsig soul (60–1 and 160). In general, however, the illness is looked upon as a struggle between Schreber the man and God, in which victory lies with the man, weak though he is, because the Order of Things is on his side (61).

The medical report might easily lead us to suppose that Schreber exhibited the everyday form of Redeemer phantasy, in which the patient believes he is the son of God, destined to save the world from its misery or from the destruction that is threatening it, and so on. It is for this reason that I have been careful to present in detail the peculiarities of Schreber's relation to God. The significance of this relation for the rest of mankind is only rarely alluded to in the *Denkwürdigkeiten* and not until the last phase of his delusional formation. It consists essentially in the fact that no-one who dies can enter the state of bliss so long as the greater part of the rays of God are absorbed in his (Schreber's)[2] person, owing to his powers of attraction (32). It is only at a very late stage, too, that his identification with Jesus Christ makes an undisguised appearance (338 and 431).

1 Even in the basic language it occasionally happened that God was not the abuser but the abused. For instance: 'Deuce take it! What a thing to have to say – that God lets Himself be f—d!' (194.)

2 [The word in brackets was added in 1924.]

No attempt at explaining Schreber's case will have any chance of
[29] being correct which does not take into account these peculiarities in his conception of God, this mixture of reverence and rebelliousness in his attitude towards Him.

I will now turn to another subject, which is closely related to God, namely, the *state of bliss*.[1] This is also spoken of by Schreber as 'the life beyond' to which the human soul is raised after death by the process of purification. He describes it as a state of uninterrupted enjoyment, bound up with the contemplation of God. This is not very original, but on the other hand it is surprising to learn that Schreber makes a distinction between a male and a female state of bliss.[2] 'The male state of bliss was superior to the female, which seems to have consisted chiefly in an uninterrupted feeling of voluptuousness.' (18.) In other passages this coincidence between the state of bliss and voluptuousness is expressed in plainer language and without reference to sex-distinction; and moreover that element of the state of bliss which consists in the contemplation of God is not further discussed. Thus, for instance: 'The nature of the nerves of God is such that the state of bliss . . . is accompanied by a very intense sensation of voluptuousness, even though it does not consist exclusively of it.' (51.) And again: 'Voluptuousness may be regarded as a fragment of the state of bliss given in advance, as it were, to men and other living creatures.' (281.) So the state of heavenly bliss is to be understood as being in its essence an intensified continuation of sensual pleasure upon earth!

This view of the state of bliss was far from being an element in Schreber's delusion that originated in the first stages of his illness and was later eliminated as being incompatible with the rest. So late as in the Statement of his Case, drawn up by the patient [for the Appeal Court]
[30] in July, 1901, he emphasizes as one of his greatest discoveries the fact 'that voluptuousness stands in a close relationship (not hitherto

1 [See footnote 1, p. 21 above.]

2 It would be much more in keeping with the wish fulfilment offered by the life beyond that in it we shall at last be free from the difference between the sexes.

Und jene himmlischen Gestalten
sie fragen nicht nach Mann und Weib.

[From Mignon's Song in Goethe's *Wilhelm Meisters Lehrjahre*, Book VIII, Chapter 2.

And those calm shining sons of morn
They ask not who is maid or boy.
(Carlyle's translation.)]

perceptible to the rest of mankind) to the state of bliss enjoyed by departed spirits' [442].[1]

We shall find, indeed, that this 'close relationship' is the rock upon which the patient builds his hopes of an eventual reconciliation with God and of his sufferings being brought to an end. The rays of God abandon their hostility as soon as they are certain that in becoming absorbed into his body they will experience spiritual voluptuousness (133); God Himself demands that He shall be able to find voluptuousness in him (283), and threatens him with the withdrawal of His rays if he neglects to cultivate voluptuousness and cannot offer God what He demands (320).

This surprising sexualization of the state of heavenly bliss suggests the possibility that Schreber's concept of the state of bliss is derived from a condensation of the two principal meanings of the German word '*selig*' – namely, 'dead' and 'sensually happy'.[2] But this instance of sexualization will also give us occasion to examine the patient's general attitude to the erotic side of life and to questions of sexual indulgence. For we psychoanalysts have hitherto supported the view that the roots of every nervous and mental disorder are chiefly to be found in the patient's sexual life – some of us merely upon empirical grounds, others influenced in addition by theoretical considerations.

The samples of Schreber's delusions that have already been given enable us without more ado to dismiss the suspicion that it might be precisely this paranoid disorder which would turn out to be the 'negative [31]
case' which has so long been sought for – a case in which sexuality plays only a very minor part. Schreber himself speaks again and again as though he shared our prejudice. He is constantly talking in the same breath of 'nervous disorder' and erotic lapses, as though the two things were inseparable.[3]

1 The possibility of this discovery of Schreber's having a deeper meaning is discussed below. [The reference is perhaps to p. 41 ff.]

2 [See footnote 1, p. 21 above.] Extreme instances of the two uses of the word are to be found in the phrase '*mein seliger Vater*' ['my late father'] and in these lines from [the German text of '*Là ci darem*'] the duet in *Don Giovanni*:

> Ja, dein zu sein auf ewig,
> wie selig werd' ich sein.
>
> [Ah, to be thine for ever –
> How blissful I should be!]

But the fact that the same word should be used in our language in two such different situations cannot be without significance.

3 'When *moral corruption* ("voluptuous excesses") *or perhaps nervous disorder* had taken a strong enough hold upon the whole population of any terrestrial body', then, thinks Schreber, bearing in mind the biblical stories of Sodom and Gomorrah, the Deluge, etc., the world in

Before his illness Senatspräsident Schreber had been a man of strict morals: 'Few people', he declares, and I see no reason to doubt his assertion, 'can have been brought up upon such strict moral principles as I was, and few people, all through their lives, can have exercised (especially in sexual matters) a self-restraint conforming so closely to those principles as I may say of myself that I have done.' (281.) After the severe spiritual struggle, of which the phenomena of his illness were the outward signs, his attitude towards the erotic side of life was altered. He had come to see that the cultivation of voluptuousness was incumbent upon him as a duty, and that it was only by discharging this duty that he could end the grave conflict which had broken out within him – or, as he thought, about him. Voluptuousness, so the voices assured him, had become 'God-fearing' and he could only regret that he was not able to devote himself to its cultivation the whole day long[1] (285).

[32] Such, then, was the result of the changes produced in Schreber by his illness, as we find them expressed in the two main features of his delusional system. Before it he had been inclined to sexual asceticism and had been a doubter in regard to God; while after it he was a believer in God and a devotee of voluptuousness. But just as his reconquered belief in God was of a peculiar kind, so too the sexual enjoyment which he had won for himself was of a most unusual character. It was not the sexual liberty of a man, but the sexual feelings of a woman. He took up a feminine attitude towards God; he felt that he was God's wife.[2]

question might come to a catastrophic end (52). – '[A rumour] sowed fear and terror among men, wrecked the foundations of religion, and spread abroad *general nervous disorders and immorality*, so that devastating pestilences have descended upon mankind.' (91.) – 'Thus it seems probable that by a "Prince of Hell" the souls meant the uncanny [*unheimliche*] Power that was able to develop in a sense hostile to God as a result of *moral depravity* among men or *of a general state of excessive nervous excitement following upon over-civilization*.' (163.) [The italics in this footnote are Freud's.]

1 In connection with his delusions he writes: '*This attraction* [i.e. the attraction exercised by Schreber upon the nerves of God (see p. 22 above)], *however, lost its terrors for the nerves in question, if, and insofar as, upon entering my body, they encountered a feeling of spiritual voluptuousness* in which they themselves shared. For, if this happened, they found an equivalent or approximately equivalent substitute in my body for the state of heavenly bliss which they had lost, and which itself consisted in a kind of voluptuous enjoyment.' (179–80.)

2 'Something occurred in my own body similar to the conception of Jesus Christ in an immaculate virgin, that is, in a woman who had never had intercourse with a man. On two separate occasions (and while I was still in Professor Flechsig's institution) I have possessed female genitals, though somewhat imperfectly developed ones, and have felt a stirring in my body, such as would arise from the quickening of a human embryo. Nerves of God corresponding to male semen had, by a divine miracle, been projected into my body, and impregnation had thus taken place.' (Introduction, 4.) [Schreber's book includes both a preface and an introduction as well as a prefatory 'Open Letter to Professor Flechsig'. Cf. p. 10 *n.* 3 above and p. 33 *n.* 2 below.]

No other part of his delusions is treated by the patient so exhaustively, one might almost say so insistently, as his alleged transformation into a woman. The nerves absorbed by him have, so he says, assumed in his body the character of female nerves of voluptuousness, and have given to his body a more or less female stamp, and more particularly to his skin a softness peculiar to the female sex (87). If he presses lightly with his fingers upon any part of his body, he can feel these nerves, under the surface of the skin, as a tissue of a thread-like or stringy texture; they are especially present in the region of the chest, where, in a woman, her breasts would be. 'By applying pressure to this tissue, I am able to evoke a sensation of voluptuousness such as women experience, and especially if I think of something feminine at the same time.' (277.) He knows with certainty that this tissue was originally nothing else than nerves of God, which could hardly have lost the character of nerves merely through having passed over into his body (279). By means of what he calls 'drawing' (that is, by calling up visual images) he is able to give both himself and the rays an impression that his body is fitted out with female breasts and genitals: 'It has become so much a habit with me to draw female but- [33]
tocks on to my body – *honi soit qui mal y pense* – that I do it almost involuntarily every time I stoop.' (233.) He is 'bold enough to assert that anyone who should happen to see me before the mirror with the upper portion of my torso bared – especially if the illusion is assisted by my wearing a little feminine finery – would receive an unmistakable impression of a *female bust*' (280). He calls for a medical examination, in order to establish the fact that his whole body has nerves of voluptuousness dispersed over it from head to foot, a state of things which is only to be found, in his opinion, in the female body, whereas, in the male, to the best of his knowledge, nerves of voluptuousness exist only in the sexual organs and their immediate vicinity (274). The spiritual voluptuousness which has been developed owing to this accumulation of nerves in his body is so intense that it requires only a slight effort of his imagination (especially when he is lying in bed) to procure him a feeling of sensual well-being that affords a tolerably clear adumbration of the sexual pleasure enjoyed by a woman during copulation (269).

If we now recall the dream which the patient had during the incubation period of his illness, before he had moved to Dresden [p. 12 above], it will become clear beyond a doubt that his delusion of being transformed into a woman was nothing else than a realization of the content of that dream. At that time he had rebelled against the dream with masculine indignation, and in the same way he began by striving against its

fulfilment in his illness and looked upon his transformation into a woman as a disgrace with which he was threatened with hostile intention. But there came a time (it was in November, 1895) when he began to reconcile himself to the transformation and bring it into harmony with the higher purposes of God: 'Since then, and with a full consciousness of what I did, I have inscribed upon my banner the cultivation of femaleness.' (177–8.)

He then arrived at the firm conviction that it was God Himself who, for His own satisfaction, was demanding femaleness from him:

'No sooner, however, am I alone with God (if I may so express it), than it becomes a necessity for me to employ every imaginable device and to summon up the whole of my mental faculties, and especially my imagination, in order to bring it about that the divine rays may have the
[34] impression as continuously as possible (or, since this is beyond mortal power, at least at certain times of day) that I am a woman luxuriating in voluptuous sensations.' (281.)

'On the other hand, God demands a *constant state of enjoyment*, such as would be in keeping with the conditions of existence imposed upon souls by the Order of Things; and it is my duty to provide Him with this . . . in the shape of the greatest possible generation of spiritual voluptuousness. And if, in this process, a little sensual pleasure falls to my share, I feel justified in accepting it as some slight compensation for the inordinate measure of suffering and privation that has been mine for so many past years . . .' (283.)

'. . . I think I may even venture to advance the view, based upon impressions I have received, that God would never take any steps towards effecting a withdrawal – the first result of which is invariably to alter my physical condition markedly for the worse – but would quietly and permanently yield to my powers of attraction, if it were possible for me *always* to be playing the part of a woman lying in my own amorous embraces, *always* to be casting my looks upon female forms, *always* to be gazing at pictures of women, and so on.' (284–5.)

In Schreber's system the two principal elements of his delusions (his transformation into a woman and his favoured relation to God) are linked in his assumption of a feminine attitude towards God. It will be an unavoidable part of our task to show that there is an essential *genetic* [*genetische*][T] relation between these two elements. Otherwise our attempts at elucidating Schreber's delusions will leave us in the absurd position described in Kant's famous simile in the *Critique of Pure Reason* – we shall be like a man holding a sieve under a he-goat while someone else milks it.

II
ATTEMPTS AT INTERPRETATION[1]

There are two angles from which we could attempt to reach an understanding of this history of a case of paranoia and to lay bare in it the familiar complexes and driving forces [*Triebkräfte*][T] of mental life. We might start either from the patient's own delusional utterances or from the exciting causes of his illness. [35]

The former method must seem enticing since the brilliant example given us by Jung (1907) in his interpretation of a case of dementia praecox which was far severer than this one and which exhibited symptoms far more remote from the normal. The high level of our present patient's intelligence, too, and his communicativeness, seem likely to facilitate the accomplishment of our task along these lines. He himself not infrequently presses the key into our hands, by adding a gloss, a quotation or an example to some delusional proposition in an apparently incidental manner, or even by expressly denying some parallel to it that has arisen in his own mind. For when this happens, we have only to follow our usual psychoanalytic technique – to strip his sentence of its negative form, to take his example as being the actual thing, or his quotation or gloss as being the original source – and we find ourselves in possession of what we are looking for, namely a translation of the paranoic mode of expression into the normal one.

It is perhaps worth giving a more detailed illustration of this procedure. Schreber complains of the nuisance created by the so-called 'miracled birds' or 'talking birds', to which he ascribes a number of very remarkable qualities (208–14). It is his belief that they are composed of former 'forecourts of Heaven', that is, of human souls which have entered into a state of bliss, and that they have been loaded with ptomaine[2] poison and set on to him. They have been brought to the condition of repeating 'meaningless phrases which they have learnt by heart' and which have been 'dinned into them'. Each time that they have discharged their load of ptomaine poison on to him – that is, each time that they have 'reeled off the phrases which have been dinned into them, as it were' – they [36] become to some extent absorbed into his soul, with the words 'The deuce of a fellow!' or 'Deuce take it!' which are the only words they are still

1 [*Deutungsversuche*.][T] *Deutung*

2 [German '*Leichengift*', literally 'corpse poison'.]

capable of using to express a genuine feeling. They cannot understand the meaning of the words they speak, but they are by nature susceptible to similarity of sounds, though the similarity need not necessarily be a complete one. Thus it is immaterial to them whether one says:

> '*Santiago*' or '*Karthago*',
> '*Chinesentum*' or '*Jesum Christum*',
> '*Abendrot*' or '*Atemnot*',
> '*Ariman*' or '*Ackermann*' etc.[1] (210.)

As we read this description, we cannot avoid the idea that what it really refers to must be young girls. In a carping mood people often compare them to geese, ungallantly accuse them of having 'the brains of a bird' and declare that they can say nothing but phrases learnt by rote and they betray their lack of education by confusing foreign words that sound alike. The phrase 'The deuce of a fellow!', which is the only thing that they are serious about, would in that case be an allusion to the triumph of the young man who has succeeded in impressing them. And, sure enough, a few pages later we come upon a passage in which Schreber confirms this interpretation: 'For purposes of distinction, I have as a joke given girls' names to a great number of the remaining bird-souls; since by their inquisitiveness, their voluptuous bent, etc., they one and all most readily suggest a comparison with little girls. Some of these girls' names have since been adopted by the rays of God and have been retained as a designation of the bird-souls in question.' (214.) This easy interpretation of the 'miracled birds' gives us a hint which may help us towards understanding the enigmatic 'forecourts of Heaven'.

I am quite aware that a psychoanalyst needs no small amount of tact and restraint whenever in the course of his work he goes beyond the typical instances of interpretation, and that his listeners or readers will
[37] follow him only as far as their own familiarity with analytic technique will allow them. He has every reason, therefore, to guard against the risk that an increased display of acumen on his part may be accompanied by a diminution in the certainty and trustworthiness of his results. It is thus only natural that one analyst will tend too much in the direction of caution and another too much in the direction of boldness. It will not be possible to define the proper limits of justifiable interpretation until many experiments have been made and until the subject has become

1 ['Santiago' or 'Carthage',
'Chinese-dom' or 'Jesus Christ',
'Sunset' or 'Breathlessness',
'Ahriman' or 'Farmer'.]

more familiar. In working upon the case of Schreber I have had a policy of restraint forced on me by the circumstance that the opposition to his publishing the *Denkwürdigkeiten* was so far effective as to withhold a considerable portion of the material from our knowledge – the portion, too, which would in all probability have thrown the most important light upon the case.[1] Thus, for instance, the third chapter of the book opens with this promising announcement: 'I shall now proceed to describe certain events which occurred to *other members of my family* and which may conceivably have been connected with the soul murder I have postulated; for there is at any rate something more or less problematical about all of them, something not easily explicable upon the lines of ordinary human experience.' (33.) But the next sentence, which is also the last of the chapter, is as follows: 'The remainder of this chapter has been withheld from print as being unsuitable for publication.' I shall therefore have to be satisfied if I can succeed in tracing back at any rate the nucleus of the delusional structure with some degree of certainty to familiar human motives.

With this object in view I shall now mention a further small piece of [38]
the case history to which sufficient weight is not given in the reports, although the patient himself has done all he can to put it in the foreground. I refer to Schreber's relations to his first physician, Geheimrat Prof. Flechsig of Leipzig.

As we already know, Schreber's case at first took the form of delusions of persecution, and did not begin to lose it until the turning point of his illness (the time of his 'reconciliation'). From that time onwards the persecutions became less and less intolerable, and the ignominious purpose which at first underlay his threatened emasculation began to be superseded by a purpose in consonance with the Order of Things. But the first author of all these acts of persecution was Flechsig, and he remains their instigator throughout the whole course of the illness.[2]

1 'When we survey the contents of this document', writes Dr Weber in his report, 'and consider the mass of indiscretions in regard to himself and other persons which it contains, when we observe the unblushing manner in which he describes situations and events which are of the most delicate nature and indeed, in an aesthetic sense, utterly impossible, when we reflect upon his use of strong language of the most offensive kind, and so forth, we shall find it quite impossible to understand how a man, distinguished apart from this by his tact and refinement, could contemplate taking a step so compromising to himself in the public eye, unless we bear in mind the fact that . . .' etc. etc. (402.) Surely we can hardly expect that a case history which sets out to give a picture of deranged humanity and its struggles to rehabilitate itself should exhibit 'discretion' and 'aesthetic' charm.

2 'Even now the voices that talk with me call out your name to me hundreds of times each day. They name you in certain constantly recurring connections, and especially as being the first author of the injuries I have suffered. And yet the personal relations which existed between us for a time have, so far as I am concerned, long since faded into the background; so that I myself could have little enough reason to be for ever recalling you to my mind, and still less for doing so with any feelings of resentment.' ('Open Letter to Professor Flechsig', viii.) [See footnote 2, p. 28 above.]

Of the actual nature of Flechsig's enormity and its motives the patient speaks with the characteristic vagueness and obscurity which may be regarded as marks of an especially intense work of delusion formation,[1] if it is legitimate to judge paranoia on the model of a far more familiar mental phenomenon – the dream. Flechsig, according to the patient, committed, or attempted to commit, 'soul murder' upon him – an act which, he thought, was comparable with the efforts made by the Devil or by demons to gain possession of a soul, and may have had its prototype in events which occurred between members of the Flechsig and Schreber families long since deceased (22 ff.). We should be glad to learn more of the meaning of this 'soul murder', but at this point our sources relapse once more into a tendentious silence: 'As to what constitutes the true essence of soul murder, and as to its technique, if I may so describe it, I am able to
[39] say nothing beyond what has already been indicated. There is only this, perhaps, to be added . . . (The passage which follows is unsuitable for publication.)' (28.) As a result of this omission we are left in the dark on the question of what is meant by 'soul murder'. We shall refer later on [p. 39 below] to the only hint upon the subject which has evaded censorship.

However this may be, a further development of Schreber's delusions soon took place, which affected his relations to God without altering his relations to Flechsig. Hitherto he had regarded Flechsig (or rather his soul) as his only true enemy and had looked upon God Almighty as his ally; but now he could not avoid the thought that God Himself had played the part of accessory, if not of instigator, in the plot against him (59). Flechsig, however, remained the first seducer, to whose influence God had yielded (60). He had succeeded in making his way up to Heaven with his whole soul or a part of it and in becoming a 'leader of rays', without dying or undergoing any preliminary purification[2] (56). The Flechsig soul continued to play this role even after the patient had been moved from the Leipzig clinic to Dr Pierson's asylum.[3] The influence of the new environment was shown by the Flechsig soul being joined by the soul of the chief attendant, whom the patient recognized as a person who had formerly lived in the same block of flats as

1 ['*Wahnbildungsarbeit*.' This is parallel to '*Traumarbeit*' ('dream-work'), the term used in *The Interpretation of Dreams* (1900*a*), Chapter VI; *RSE*, **4**, 246 ff.]

2 ['*Reinigung*.' In the first edition only, '*Peinigung*' ('torment'), certainly a misprint.] – According to another and significant version, which, however, was soon rejected, Professor Flechsig had shot himself, either at Weissenburg in Alsace or in a police cell at Leipzig. The patient saw his funeral go past, though not in the direction that was to be expected in view of the relative positions of the University Clinic and the cemetery. On other occasions Flechsig appeared to him in the company of a policeman, or in conversation with his [Flechsig's] wife. Schreber was a witness to this conversation by the method of 'nerve-connection', and in the course of it Professor Flechsig called himself 'God Flechsig' to his wife, so that she was inclined to think he had gone mad (82).

3 [At Lindenhof. See footnote 1, p. 13 above.]

himself. This was represented as being the von W. soul.[1] The Flechsig soul then introduced the system of 'soul-division', which assumed large proportions. At one time there were as many as forty to sixty subdivisions of the Flechsig soul; two of its larger divisions were known as the 'upper Flechsig' and the 'middle Flechsig'. The von W. soul (the chief attendant's) behaved in just the same fashion (111). It was sometimes most entertaining to notice the way in which these two souls,[2] in spite of their alliance, carried on a feud with one another, the aristocratic pride of the one pitted against the professorial vanity of the other (113). During his first weeks at Sonnenstein (to which he was finally moved in the summer of 1894) the soul of his new physician, Dr Weber, came into play; and shortly afterwards the changeover took place in the development of his delusions which we have come to know as his 'reconciliation'. [40]

During this later stay at Sonnenstein, when God had begun to appreciate him better, a raid was made upon the souls, which had been multiplied so much as to become a nuisance. As a result of this, the Flechsig soul survived in only one or two shapes, and the von W. soul in only a single one. The latter soon disappeared altogether. The divisions of the Flechsig soul, which slowly lost both their intelligence and their power, then came to be described as the 'posterior Flechsig' and the '"Oh well!" Party' [*Je-nun-Partei*]. That the Flechsig soul retained its importance to the last is made clear by Schreber's prefatory 'Open Letter to Herr Geheimrat Prof. Dr Flechsig'.[3]

In this remarkable document Schreber expresses his firm conviction that the physician who influenced him had the same visions and received the same disclosures upon supernatural things as he himself. He protests on the very first page that the author of the *Denkwürdigkeiten* has not the remotest intention of making an attack upon the doctor's honour, and the same point is earnestly and emphatically repeated in the patient's presentations of his position (343, 445). It is evident that he is endeavouring to distinguish the 'soul Flechsig' from the living man of the same name, the Flechsig of his delusions from the real Flechsig.[4]

1 The voices informed him that in the course of an official inquiry this von W. had made some untrue statements about him, either deliberately or out of carelessness, and in particular had accused him of masturbation. As a punishment for this he was now obliged to wait on the patient (108).

2 [The Flechsig and the von W. souls.]

3 [See footnote 2, p. 33 above.]

4 'I am accordingly obliged *to admit as a possibility* that everything in the first chapters of my *Denkwürdigkeiten* which is connected with the name of Flechsig may only refer to the soul Flechsig as distinguished from the living man. For that his soul has a separate existence is a certain fact, though it cannot be explained upon any natural basis.' (342–3.)

[41] The study of a number of cases of delusions of persecution has led me as well as other investigators to the view that the relation between the patient and his persecutor can be reduced to a simple formula.[1] It appears that the person to whom the delusion ascribes so much power and influence, in whose hands all the threads of the conspiracy converge, is, if he is definitely named, either identical to someone who played an equally important part in the patient's emotional life before his illness, or is easily recognizable as a substitute for him. The intensity of the emotion is projected in the shape of external power, while its quality is changed into the opposite. The person who is now hated and feared for being a persecutor was at one time loved and honoured. The main purpose of the persecution asserted by the patient's delusion is to justify the change in his emotional attitude.

Bearing this point of view in mind, let us now examine the relations which had formerly existed between Schreber and his physician and persecutor, Flechsig. We have already heard [p. 11 above] that, in the years 1884 and 1885, Schreber suffered from a first attack of nervous disorder, which ran its course 'without the occurrence of any incidents bordering upon the sphere of the supernatural' (35). While he was in this condition, which was described as 'hypochondria' and seems not to have overstepped the limits of a neurosis, Flechsig acted as his doctor. At that time Schreber spent six months in the University Clinic at Leipzig. We learn that after his recovery he had cordial feelings towards his doctor. 'The main thing was that, after a fairly long period of convalescence which I spent in travelling, I was finally cured; and it was therefore impossible that I should feel anything at that time but the liveliest gratitude towards Professor Flechsig. I gave a marked expression to this feeling both in a personal visit which I subsequently paid him and in what I deemed to be an appropriate honorarium.' (35–6.) It is true that Schreber's encomium in the *Denkwürdigkeiten* upon this first treatment of Flechsig's is not entirely without reservations; but that can easily be
[42] understood if we consider that his attitude had in the meantime been reversed. The passage immediately following the one that has just been quoted bears witness to the original warmth of his feelings towards the physician who had treated him so successfully: 'The gratitude of my wife was perhaps even more heartfelt; for she revered Professor Flechsig as the man who had restored her husband to her, and hence it was that for years she kept his portrait standing upon her writing table.' (36.)

1 Cf. Abraham, 1908. In the course of this paper its author, referring to a correspondence between us, scrupulously attributes to myself an influence upon the development of his views. [Cf. p. 60 *n*. 2 below.]

Since we cannot obtain any insight into the causes of the first illness (a knowledge of which is undoubtedly indispensable for properly elucidating the second and severer illness) we must now plunge at random into an unknown concatenation of circumstances. During the incubation period of his illness, as we are aware[1] (that is, between June, 1893, when he was appointed to his new post, and the following October, when he took up his duties), he repeatedly dreamt that his old nervous disorder had returned. Once, moreover, when he was half-asleep, he had a feeling that after all it must be nice to be a woman submitting to the act of copulation. The dreams and the phantasy are reported by Schreber in immediate succession; and if we also bring together their subject matter, we shall be able to infer that, at the same time as his recollection of his illness, a recollection of his doctor was also aroused in his mind, and that the feminine attitude which he assumed in the phantasy was from the first directed towards the doctor. Or it may be that the dream of his illness having returned simply expressed some such longing as: 'I wish I could see Flechsig again!' Our ignorance of the mental content of the first illness bars our way in this direction. Perhaps that illness had left behind in him a feeling of affectionate dependence upon his doctor, which had now, for some unknown reason, become intensified to the pitch of an erotic desire. This feminine phantasy, which was still kept impersonal, was met at once by an indignant repudiation – a true 'masculine protest', to use Adler's expression, but in a sense different from his.[2] But in the severe psychosis which broke out soon afterwards the feminine phantasy carried everything before it; and it requires only a slight correction of the characteristic paranoic [43]
indefiniteness of Schreber's mode of expression to enable us to divine the fact that the patient was in fear of sexual abuse at the hands of his doctor himself. The exciting cause of his illness, then, was an outburst of homosexual libido; the object of this libido was probably from the very first his doctor, Flechsig; and his struggles against the libidinal impulse produced the conflict which gave rise to the symptoms.

I will pause here for a moment to meet a storm of remonstrances and objections. Anyone acquainted with the present state of psychiatry must be prepared to face trouble.

'Is it not an act of irresponsible levity, an indiscretion and a calumny, to charge a man of such high ethical standing as the former

1 [See p. 12 above.]

2 Adler (1910). According to Adler the masculine protest has a share in the production of the symptom, whereas in the present instance the patient is protesting against a symptom that is already fully fledged.

Senatspräsident Schreber with homosexuality?' – No. The patient has himself informed the world at large of his phantasy of being transformed into a woman, and he has allowed all personal considerations to be outweighed by interests of a higher nature. Thus he has himself given us the right to occupy ourselves with his phantasy, and in translating it into the technical terminology of medicine we have not made the slightest addition to its content.

'Yes, but he was not in his right mind when he did it. His delusion that he was being transformed into a woman was a pathological idea.' – We have not forgotten that. Indeed our only concern is with the meaning and origin of this pathological idea. We will appeal to the distinction he himself draws between the man Flechsig and the 'Flechsig soul'. We are not making reproaches of any kind against him – whether for having had homosexual impulses or for having endeavoured to suppress them. Psychiatrists should at last take a lesson from this patient, when they see him trying, in spite of his delusions, not to confuse the world of the unconscious with the world of reality.

'But it is nowhere expressly stated that the transformation into a woman which he so much dreaded was to be carried out for the benefit of Flechsig.' – That is true; and it is not difficult to understand why, in preparing his memoirs for publication, since he was anxious not to insult the 'man Flechsig', he should have avoided so gross an accusation. But the toning down of his language owing to these considerations did not go so far as to be able to conceal the true meaning of his accusation. Indeed,
[44] it may be maintained that after all it is expressed openly in such a passage as the following: 'In this way a conspiracy against me was brought to a head (in about March or April, 1894). Its object was to contrive that, when once my nervous complaint had been recognized as incurable or assumed to be so, *I should be handed over to a certain person* in such a manner that my soul should be delivered up to him, but my body . . . should be transformed into a female body, and *as such surrendered to the person in question* with a view to sexual abuse . . .'[1] (56). It is unnecessary to remark that no other individual is ever named who could be put in Flechsig's place. Towards the end of Schreber's stay in the clinic at Leipzig, a fear occurred to his mind that he 'was to be thrown to the attendants' for the purpose of sexual abuse (98). Any remaining doubts that we have upon the nature of the part originally attributed to the doctor are dispelled when, in the later stages of his delusion, we find Schreber outspokenly admitting his feminine attitude towards God. The

1 The italics in this passage are mine.

other accusation against Flechsig echoes over-loudly through the book. Flechsig, he says, tried to commit soul murder upon him. As we already know [p. 34 above], the patient was himself not clear as to the actual nature of that crime, but it was connected with matters of discretion which precluded their publication (as we see from the suppressed third chapter). From this point a single thread takes us further. Schreber illustrates the nature of soul murder by drawing on the legends embodied in Goethe's *Faust*, Byron's *Manfred*, Weber's *Freischütz*, etc. (22), and one of these instances is further cited in another passage. In discussing the division of God into two persons, Schreber identifies his 'lower God' and 'upper God' with Ahriman and Ormuzd respectively (19); and a little later a casual footnote occurs: 'Moreover, the name of Ahriman also appears in connection with a soul murder in, for example, Lord Byron's *Manfred*.' (20.) In the play which is thus referred to there is scarcely anything comparable to the bartering of Faust's soul, and I have searched it in vain for the expression 'soul murder'. But the essence and the secret of the whole work lies in – an incestuous relation between a brother and a sister. And here our thread breaks off short.[1]

At a later stage in this paper I intend to return to a discussion of some [45]
further objections; but in the meantime I shall consider myself justified in maintaining the view that the basis of Schreber's illness was the outburst of a homosexual impulse. This hypothesis harmonizes with a noteworthy detail of the case history, which remains otherwise inexplicable. The patient had a fresh 'nervous collapse', which exercised a decisive effect upon the course of his illness, at a time when his wife was taking a short holiday on account of her own health. Up till then she had spent several hours with him every day and had taken her midday meal with him. But when she returned after an absence of four days, she found him most sadly altered: so much so, indeed, that he himself no longer wished to see her. 'What especially determined my mental breakdown

1 By way of substantiating the above assertion I will quote a passage from the last scene of the play, in which Manfred says to the demon who has come to fetch him away:

> . . . my past power
> Was purchased by no compact with thy crew.

There is thus a direct contradiction of a soul having been bartered. This mistake on Schreber's part was probably not without its significance. – It is plausible, by the way, to connect the plot of *Manfred* with the incestuous relations which have repeatedly been asserted to exist between the poet and his half-sister. And it is not a little striking that the action of Byron's other play, his celebrated *Cain*, should be laid in the primal family, where no objections could exist to incest between brother and sister. – Finally, we cannot leave the subject of soul murder without quoting one more passage from the *Denkwürdigkeiten*: 'in this connection Flechsig used formerly to be named as the first author of soul murder, whereas for some time past the facts have been deliberately inverted and an attempt has been made to "represent" myself as being the one who practises soul murder . . .' (23). [Cf. below, p. 46.]

was a particular night, during which I had a quite extraordinary number of emissions – quite half a dozen, all in that one night.' (44.) It is easy to understand that the mere presence of his wife must have acted as a protection against the attractive power of the men about him; and if we are prepared to admit that an emission cannot occur in an adult without some mental concomitant, we shall be able to supplement the patient's emissions that night by assuming that they were accompanied by homosexual phantasies which remained unconscious.

[46] The question of why this outburst of homosexual libido overtook the patient precisely at this period (that is, between the dates of his appointment and of his move to Dresden) cannot be answered in the absence of more precise knowledge of the story of his life. Generally speaking, every human being oscillates all through his life between heterosexual and homosexual feelings, and any frustration or disappointment in the one direction is apt to drive him over into the other. We know nothing of these factors in Schreber's case, but we must not omit to draw attention to a somatic factor which may very well have been relevant. At the time of this illness Dr Schreber was fifty-one years old, and he had therefore reached an age which is of critical importance in sexual life. It is a period at which in women the sexual function, after a phase of intensified activity, enters upon a process of far-reaching involution; nor do men appear to be exempt from its influence, for men as well as women are subject to a 'climacteric' and to the susceptibilities to disease which go along with it.[1]

I can well imagine what a dubious hypothesis it must appear to be to suppose that a man's friendly feeling towards his doctor can suddenly break out in an intensified form after a lapse of eight years[2] and become the occasion of such a severe mental disorder. But I do not think we should be justified in dismissing such a hypothesis merely on account of its inherent improbability, if it recommends itself to us on other grounds; we ought rather to enquire how far we shall get if we follow it up. For the improbability may be of a passing kind and may be due to the fact that the doubtful hypothesis has not as yet been brought into relation with any other pieces of knowledge and that it is the first hypothesis

1 I owe my knowledge of Schreber's age at the time of his illness to some information which was kindly given me by one of his relatives, through the agency of Dr Stegmann of Dresden. Apart from this one fact, however, I have made use of no material in this paper that is not derived from the actual text of the *Denkwürdigkeiten*. [Freud, as we now know, obtained certain other facts from Dr Stegmann of which he made no use in the published paper. See p. 5 *n.* above and p. 44 *n.* 1 below. – The significance of the age of 51 is no doubt a survival of Fliess's numerical theories. Cf. the same figure in a dream of Freud's reported in *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 391.]

2 This was the length of the interval between Schreber's first and second illnesses.

with which the problem has been approached. But for the benefit of those who are unable to hold their judgement in suspense and who regard our hypothesis as altogether untenable, it is easy to suggest a possibility which would rob it of its bewildering character. The patient's friendly feeling towards his doctor may very well have been due to a process of 'transference' [*'Übertragungsvorgang'*][T], by means of which an emotional cathexis [*Gefühlsbesetzung*][T] became transposed from some person who was important to him on to the doctor who was in reality indifferent to him; so that the doctor will have been chosen as a deputy or surrogate for someone much closer to him. To put the matter in a more concrete form: the patient was reminded of his brother or father by the figure of the doctor, he rediscovered them in him; there will then be nothing to wonder at if, in certain circumstances, a longing for the surrogate figure reappeared in him and operated with a violence that is only to be explained in the light of its origin and primary significance. [47] *Übertragung* *Besetzung*

With a view to following up this attempt at an explanation, I naturally thought it worthwhile discovering whether the patient's father was still alive at the time at which he fell ill, whether he had had a brother, and if so whether he was then living or among the 'blest'. I was pleased, therefore, when, after a prolonged search through the pages of the *Denkwürdigkeiten*, I came at last upon a passage in which the patient sets these doubts at rest: 'The memory of my father and my brother . . . is as sacred to me as . . .' etc. (442.) So that both of them were dead at the time of the onset of his second illness (and, it may be, of his first illness as well).[1]

We shall therefore, I think, raise no further objections to the hypothesis that the exciting cause of the illness was the appearance in him of a feminine (that is, a passive homosexual) wishful phantasy, which took as its object the figure of his doctor. An intense resistance to this phantasy arose on the part of Schreber's personality, and the ensuing defensive struggle [*Abwehrkampf*][T], which might perhaps just as well have assumed some other shape, took on, for reasons unknown to us, that of a delusion of persecution. The person he longed for now became his persecutor, and the content of his wishful phantasy became the content of his persecution. It may be presumed that the same schematic outline will turn out to be applicable to other cases of delusions of persecution. What distinguishes Schreber's case from others, however, is its further development and the transformation it underwent in the course of it. *Abwehr* [48]

One such change was the replacement of Flechsig with the superior figure of God. This seems at first as though it were a sign of

1 [His father had died in 1861 and his only brother in 1877 (Baumeyer, 1956, 74 and 69).]

aggravation of the conflict, an intensification of the unbearable persecution, but it soon becomes evident that it was preparing the way for the second change and, with it, the solution to the conflict. It was impossible for Schreber to become reconciled to playing the part of a female wanton towards his doctor; but the task of providing God Himself with the voluptuous sensations that He required called up no such resistance on the part of his ego. Emasculation was now no longer a disgrace; it became 'consonant with the Order of Things', it took its place in a great cosmic chain of events, and was instrumental in the re-creation of humanity after its extinction. 'A new race of men, born from the spirit of Schreber' would, so he thought, revere as their ancestor this man who believed himself the victim of persecution. By this means an outlet was provided which would satisfy both of the contending forces. His ego found compensation in his megalomania, while his feminine wishful phantasy made its way through and became acceptable. The struggle and the illness could cease. The patient's sense of reality, however, which had in the meantime become stronger, compelled him to postpone the solution from the present to the remote future, and to content himself with what might be described as an asymptotic wish fulfilment.[1] Some time or other, he anticipated, his transformation into a woman would come about; until then the personality of Dr Schreber would remain indestructible.

In textbooks of psychiatry we frequently come across statements to the effect that megalomania can develop out of delusions of persecution. The process is supposed to be as follows. The patient is primarily the victim of a delusion that he is being persecuted by powers of the greatest might. He then feels a need to account to himself for this, and in that way hits on the idea that he himself is a very exalted personage and worthy of
[49] such persecution. The development of megalomania is thus attributed by the textbooks to a process which (borrowing a useful word from Ernest Jones [1908]) we may describe as 'rationalization'. But to ascribe such important affective consequences to a rationalization is, as it seems to us, an entirely unpsychological proceeding; and we would consequently draw a sharp distinction between our opinion and the one which we have quoted from the textbooks. We are making no claim, for the moment, to knowing the origin of the megalomania.[2]

1 'It is only', he writes towards the end of the book, 'as possibilities which must be taken into account, that I mention that my emasculation may even yet be accomplished and may result in a new generation issuing from my womb by divine impregnation.' (293.)

2 [The question is taken up again below, in connection with the concept of narcissism. See pp. 56 and 62–4.]

Turning once more to the case of Schreber, we are bound to admit that any attempt at throwing light upon the transformation in his delusion brings us up against extraordinary difficulties. In what manner and by what means was the ascent from Flechsig to God brought about? From what source did he derive the megalomania which so fortunately enabled him to become reconciled to his persecution, or, in analytical phraseology, to accept the wishful phantasy which had had to be repressed? The *Denkwürdigkeiten* give us a first clue; for they show us that in the patient's mind 'Flechsig' and 'God' belonged to the same class. In one of his phantasies he overheard a conversation between Flechsig and his wife, in which the former asserted that he was 'God Flechsig', so that his wife thought he had gone mad (82). But there is another feature in the development of Schreber's delusions which claims our attention. If we take a survey of the delusions as a whole we see that the persecutor is divided into Flechsig and God; in just the same way Flechsig himself subsequently splits up into two personalities, the 'upper' and the 'middle' Flechsig [p. 35 above], and God into the 'lower' and the 'upper' God. In the later stages of the illness the decomposition of Flechsig goes further still (193). A process of decomposition of this kind is very characteristic of paranoia. Paranoia decomposes just as hysteria condenses [*verdichtet*]. Or rather, paranoia resolves once more into their elements the products of the condensations and identifications which are effected in the unconscious.[1] The frequent repetition of the decomposing process in Schreber's case would, according to Jung, be an expression of the importance which the person in question possessed for him.[2] All of this dividing up of Flechsig and God into a number of persons thus had the same meaning as the splitting of the persecutor into Flechsig and God. They were all duplications of one and the same important relationship.[3] But in order to interpret all these details, we must further draw attention to our view of this decomposition of the persecutor into Flechsig and God as a paranoid reaction to a previously established identification of the two figures or their belonging to the [50]

1 [There may possibly be some hint at this notion in the passage from the letter to Fliess of December 9, 1899, which is quoted in the Editors' Note to the paper on 'The Disposition to Obsessional Neurosis', p. 310 below.]

2 Jung (1910*d*). Jung is probably right when he goes on to say that this decomposition follows the general lines taken by schizophrenia in that it uses a process of analysis in order to produce a watering-down effect, and is thus designed to prevent the occurrence of unduly powerful impressions. When, however, one of his patients said to him: 'Oh, are you Dr J. too? There was someone here this morning who said he was Dr J.', we must interpret it as being an admission to this effect: 'You remind me now of a different member of the class of my transferences from the one you reminded me of when you visited me last.'

3 Otto Rank (1909) has found the same process at work in the formation of myths.

same class. If the persecutor Flechsig was originally a person whom Schreber loved, then God must also simply be the reappearance of someone else whom he loved, and probably someone of greater importance.

If we pursue this train of thought, which seems to be a legitimate one, we shall be driven to the conclusion that this other person must have been his father; this makes it all the clearer that Flechsig must have stood for his brother – who, let us hope, may have been older than himself.[1] The feminine phantasy, which aroused such violent opposition in the patient, thus had its root in a longing, intensified to an erotic pitch, for his father and brother. This feeling, so far as it referred to his brother, passed, by a process of transference, on to his doctor, Flechsig; and when it was carried back on to his father a settlement of the conflict was reached.

We shall not feel that we have been justified in thus introducing Schreber's father into his delusions, unless the new hypothesis shows itself of some use to us in understanding the case and in elucidating
[51] details of the delusions which are as yet unintelligible. It will be recalled that Schreber's God and his relations to Him exhibited the most curious features: how they showed the strangest mixture of blasphemous criticism and mutinous insubordination on the one hand and of reverent devotion on the other. God, according to him, had succumbed to the misleading influence of Flechsig: He was incapable of learning anything by experience, and did not understand living men because He knew only how to deal with corpses; and He manifested His power in a succession of miracles which, striking though they might be, were nonetheless futile and silly.

Now the father of Senatspräsident Dr Schreber was no insignificant person. He was the Dr Daniel Gottlob[2] Moritz Schreber whose memory is kept green to this day by the numerous Schreber Associations which flourish especially in Saxony; and, moreover, he was a *physician*. His activities in favour of promoting the harmonious upbringing [*Ausbildung*] of the young, of securing coordination between education in the home and in the school, of introducing physical culture and manual work with a view to raising the standards of health – all this exerted a lasting influence upon his contemporaries.[3] His great reputation as the

1 No information on this point is to be found in the *Denkwürdigkeiten*. [His only brother was, in fact, three years his senior (Baumeyer, 1956, 69). Freud had learnt that his 'guess was correct' through Dr Stegmann. (See p. 5 *n.* and p. 40 *n.* 1 above.)]

2 [In all the German editions this name is given incorrectly as 'Gottlieb'.]

3 I have to thank my colleague Dr Stegmann of Dresden for his kindness in letting me see a copy of a journal entitled *Der Freund der Schreber-Vereine* [*The Friend of the Schreber Associations*]. This number (Vol. II, No. 10) celebrates the centenary of Dr Schreber's birth, and some

founder of therapeutic gymnastics in Germany is still shown by the wide circulation of his *Ärztliche Zimmergymnastik* [1855] in medical circles and the numerous editions through which it has passed.[1]

Such a father as this was by no means unsuitable for transfiguration into a God in the affectionate memory of the son from whom he had been so early separated by death. It is true that we cannot help feeling that there is an impassable gulf between the personality of God and that of any human being, however eminent he may be. But we must remember that this has not always been so. The gods of the peoples of antiquity stood in a closer human relationship to them. The Romans used to deify their dead emperors as a matter of routine; and the Emperor Vespasian, a sensible and competent man, exclaimed when he was first taken ill: 'Alas! Methinks I am becoming a God!'[2] [52]

We are perfectly familiar with the infantile attitude of boys towards their father; it is composed of the same mixture of reverent submission and mutinous insubordination that we have found in Schreber's relation to his God, and is the unmistakable prototype of that relation, which is faithfully copied from it. But the circumstance that Schreber's father was a physician, and a most eminent physician, and one who was no doubt highly respected by his patients, is what explains the most striking characteristics of his God and those upon which he dwells in such a critical fashion. Could more bitter scorn be shown for such a physician than by declaring that he understands nothing about living men and only knows how to deal with corpses? No doubt it is an essential attribute of God to perform miracles; but a physician performs miracles too; he effects miraculous cures, as his enthusiastic clients proclaim. So that when we see that these very miracles (the material for which was provided by the patient's hypochondria) turn out to be incredible, absurd and to some extent positively silly, we are reminded of the assertion in my *Interpretation of Dreams* that absurdity in dreams expresses ridicule and derision.[3] Evidently, therefore, it is used for the same purposes in paranoia. As regards some of the other reproaches which he levelled against God, such, for instance, as that He learnt nothing by experience, it is natural

biographical data are contained in it. Dr Schreber senior was born in 1808 and died in 1861, at the age of only fifty-three. From the source which I have already mentioned I know that our patient was at that time nineteen years old. [Some biographical information about Schreber's father can also be found in Baumeyer (1956, 74) and Niederland (1974).]

1 [Nearly forty in all. An English translation of the book appeared under the title *Medical Indoor Gymnastics* in 1856 and again in 1899 and 1912.]

2 Suetonius, *Lives of the Caesars*, Book VIII, Chapter 23. This practice of deification began with Julius Caesar. Augustus styled himself '*Divi filius*' ['the son of the God'] in his inscriptions.

3 *RSE*, **5**, 397. [Cf. also the 'Rat Man' case, ibid., **10**, 166.]

to suppose that they are examples of the *tu quoque* mechanism used by children,[1] which, when they receive a reproof, flings it back unchanged upon the person who originated it. Similarly, the voices give us grounds
[53] for suspecting that the accusation of soul murder brought against Flechsig was in the first instance a self-accusation.[2]

Emboldened by the discovery that his father's profession helps to explain the peculiarities of Schreber's God, we shall now venture upon an interpretation which may throw some light upon the remarkable structure of that Being. The heavenly world consisted, as we know, of the 'anterior realms of God', which were also called the 'forecourts of Heaven' and which contained the souls of the dead, and of the 'lower' and the 'upper' God, who together constituted the 'posterior realms of God' (19) [p. 21 above]. Although we must be prepared to find that there is a condensation here which we shall not be able to resolve, it is nevertheless worthwhile referring to a clue that is already in our hands. If the 'miracled' birds, which have been shown to be girls, were originally forecourts of Heaven [p. 31], may it not be that the *anterior* realms of God and the forecourts[3] of Heaven are to be regarded as a symbol of what is female, and the *posterior* realms of God as a symbol of what is male? If we knew for certain that Schreber's dead brother was older than himself, we might suppose that the decomposition of God into the lower and the upper God gave expression to the patient's recollection that after his father's early death his elder brother had stepped into his place.[4]

In this connection, finally, I should like to draw attention to the subject of the *sun*, which, through its 'rays', came to have so much importance in the expression of his delusions. Schreber has a quite peculiar relation to the sun. It speaks to him in human language, and thus reveals itself to him as a living being, or as the organ of a yet higher being lying behind it (9). We learn from a medical report that at one time he 'used to shout threats and abuse at it and positively bellow at it' (382)[5] and used to call
[54] out to it that it must crawl away from him and hide. He himself tells us

1 It looks remarkably like a *revanche* of this sort when we find the patient writing out the following memorandum one day: '*Any attempt at exercising an educative influence must be abandoned as hopeless*.' (188.) The uneducable one was God.

2 'Whereas for some time past the facts have been deliberately inverted and an attempt has been made to "represent" myself as being the one who practises soul murder . . .' etc. (23.) [See above, p. 39 *n*.]

3 [The German word '*Vorhof*', besides having the literal meaning of 'forecourt', is used in anatomy as a synonym for the 'vestibulum', a region of the female genitals. The word appears in Freud's analysis of 'Dora' (1905*e*), *RSE*, 7, 88.]

4 [Cf. footnote 1, p. 44 above.]

5 'The sun is a whore', he used to exclaim (384).

that the sun turns pale before him.[1] The manner in which it is bound up with his fate is shown by the important alterations it undergoes as soon as changes begin to occur in him, as, for instance, during his first weeks at Sonnenstein (135). Schreber makes it easy for us to interpret this solar myth of his. He identifies the sun directly with God, sometimes with the lower God (Ahriman),[2] and sometimes with the upper. 'On the following day . . . I saw the upper God (Ormuzd), and this time not with my spiritual eyes but with my bodily ones. It was the sun, but not the sun in its ordinary aspect, as it is known to all men; it was . . .' etc. (137–8.) It is therefore no more than consistent of him to treat it in the same way as he treats God Himself.

The sun, therefore, is nothing but another sublimated symbol for the father; and in pointing this out I must disclaim all responsibility for the monotony of the solutions provided by psychoanalysis. In this instance symbolism overrides grammatical gender – at least so far as German goes,[3] for in most other languages the sun is masculine. Its counterpart in this picture of the two parents is 'Mother Earth' as she is generally called. We frequently come upon confirmations of this assertion in resolving the pathogenic phantasies of neurotics by psychoanalysis. I can make no more than the barest allusion to the relation of all this to cosmic myths. One of my patients, who had lost his father at a very early age, was always seeking to rediscover him in what was grand and sublime in Nature. Since I have known this, it has seemed to me probable that Nietzsche's hymn 'Vor Sonnenaufgang' ['Before Sunrise'] is an expression of the same longing.[4] Another patient, who became neurotic after his father's death, was seized with his first attack of anxiety and giddiness while the sun shone upon him [55] as he was working in the garden with a spade. He spontaneously put forward as an interpretation that he had become frightened because his father had looked at him while he was at work upon his mother with a sharp instrument. When I ventured upon a mild remonstrance, he gave an air of greater plausibility to his view by telling me that

1 'To some extent, moreover, even to this day the sun presents a different picture to my eyes from what it did before my illness. When I stand facing it and speak aloud, its rays turn pale before me. I can gaze at it without any difficulty and without being more than slightly dazzled by it; whereas in my healthy days it would have been as impossible for me as for anyone else to gaze at it for a minute at a time.' (139, footnote.) [The point is referred to again in Freud's Postscript to the paper, below, p. 69 ff.]

2 'Since July, 1894, the voices that talk to me have identified him [*Ahriman*] directly with the sun.' (88.)

3 [The German word for 'sun' is feminine: '*die Sonne*'.]

4 *Also sprach Zarathustra*, Part III. It was only as a child that Nietzsche too knew his father.

even in his father's lifetime he had compared him with the sun, though then it had been in a satirical sense. Whenever he had been asked where his father was going to spend the summer he had replied in these sonorous words from the 'Prologue in Heaven':

> Und seine vorgeschrieb'ne Reise
> Vollendet er mit Donnergang.[1]

His father, acting on medical advice, had been in the habit of paying an annual visit to Marienbad. This patient's infantile attitude towards his father took effect in two successive phases. As long as his father was alive it showed itself in unmitigated rebelliousness and open discord, but immediately after his death it took the form of a neurosis based upon abject submission and deferred [*nachträglichen*] obedience to him.[2]

Thus in the case of Schreber we find ourselves once again on the familiar ground of the father complex.[3] The patient's struggle with Flechsig became revealed to him as a conflict with God, and we must therefore
Übersetzung construe [*übersetzen*][T] it as an infantile conflict with the father whom he loved; the details of that conflict (of which we know nothing) are what determined the content of his delusions. None of the material which in other cases of the sort is brought to light by analysis is absent in the present one: every element is hinted at in one way or another. In infantile experiences such as this the father appears as an interferer with the satisfaction which the child is trying to obtain; this is usually of an auto-erotic character, though at a later date it is often replaced in phantasy by some other satisfaction of a less inglorious kind.[4] In the final stage of
[56] Schreber's delusion a magnificent victory was scored by the infantile sexual urge; for voluptuousness became God-fearing, and God Himself (his father) never tired of demanding it from him. His father's most dreaded threat, castration, actually provided the material for his wishful phantasy (at first resisted but later accepted) of being transformed into a woman. His allusion to an offence covered by the surrogate idea 'soul murder' could not be more transparent. The chief attendant was discovered to be identical to his neighbour von W. [p. 34 f. above], who, according to the voices, had falsely accused him of masturbation (108). The voices said, as though giving grounds for the threat of castration:

1 ['And with a tread of thunder he accomplishes his prescribed journey.' Goethe, *Faust*, Part I.]

2 [Cf. some comments on 'deferred obedience' in the analysis of 'Little Hans' (1909*b*), *RSE*, **10**, 27 f.]

3 In the same way, Schreber's 'feminine wishful phantasy' is simply one of the typical forms taken by the infantile nuclear complex.

4 See some remarks on this subject in my analysis of the 'Rat Man' (1909*d*), ibid., **10**, 158–9 *n*.

'For you are to be *represented* as being given over to voluptuous excesses.'[1] (127–8.) Finally, we come to the enforced thinking (47) to which the patient submitted himself because he supposed that God would believe he had become an idiot and would withdraw from him if he ceased thinking for a moment. [See p. 23 above.] This is a reaction (with which we are also familiar in other connections) to the threat or fear of losing one's reason[2] as a result of indulging in sexual practices and especially in masturbation. Considering the enormous number of delusional ideas of a hypochrondriacal nature[3] which the patient developed, no great importance should perhaps be attached to the fact that some of them coincide [57] word for word with the hypochrondriacal fears of masturbators.[4]

Anyone who was more daring than I am in making interpretations, or who was in touch with Schreber's family and consequently better acquainted with the society in which he moved and the small events of his life, would find it an easy matter to trace back innumerable details of his delusions to their sources and so discover their meaning, and this in spite of the censorship to which the *Denkwürdigkeiten* have been subjected. But as it is, we must necessarily content ourselves with this shadowy sketch of the infantile material which was used by the paranoic disorder in portraying the current conflict.

1 The systems of 'representing' [128 *n.*] and of 'noting down' (126), taken in conjunction with the 'proved souls', point back to experiences in the patient's school days. – [The process of purification of souls after death (p. 20 f. above) was known in the 'basic language' as '*Prüfung*'. This is the ordinary German word for a 'school examination', but is also used for 'testing' or 'proving' in general. Souls that had not yet been purified were called, not, as might have been expected, 'unproved', but, in accordance with the tendency of the 'basic language' to make use of euphemisms (p. 21), 'proved'. 'Representing' was similarly a term meaning '*mis*representing'. Another instance of its use can be found on p. 46 *n.* 2 below. By the system of 'noting down', all Schreber's thoughts, actions, and everything connected with him, were recorded year after year in notebooks by half-witted beings, probably situated in remote heavenly bodies.]

2 'This was the end in view, as was frankly admitted at an earlier date in the phrase "We want to destroy your reason", which I have heard proceeding from the upper God upon countless occasions.' (206 *n.*)

3 I must not omit to remark at this point that I shall not consider any theory of paranoia trustworthy unless it also covers the *hypochondriacal* symptoms by which that disorder is almost invariably accompanied. It seems to me that hypochondria stands in the same relation to paranoia as anxiety neurosis does to hysteria. [The position of hypochondria was discussed by Freud at some length at the beginning of Section II of his paper on narcissism (1914*c*), *RSE*, **14**, 72 ff.]

4 'For this reason attempts were made to pump out my spinal cord. This was done by means of so-called "little men" who were placed in my feet. I shall have more to say presently on the subject of these "little men", who showed some resemblance to the phenomena of the same name which I have already discussed in Chapter VI. There used as a rule to be two of them – a "little Flechsig" and a "little von W." – and I used to hear their voices, too, in my feet.' (154.) [The word '*gleichnamigen*' ('of the same name') has been accidentally omitted from the quotation in all the German editions.] Von W. was the man who was supposed to have accused Schreber of masturbation. The 'little men' are described by Schreber himself as being among the most remarkable and, in some respects, the most puzzling phenomena of his illness (157). It looks as though they were the product of a condensation of children and – spermatozoa.

Perhaps I may be allowed to add a few words with a view to establishing the causes of this conflict that broke out in relation to the feminine wishful phantasy. As we know, when a wishful phantasy makes its appearance, our business is to bring it into connection with some *frustration* [*Versagung*],[1] some privation in real life. Now Schreber admits having suffered a privation of this kind. His marriage, which he describes as being in other respects a happy one, brought him no children; and in particular it brought him no son who might have consoled him for the loss of his father and brother and upon whom he might have drained off
[58] his unsatisfied homosexual affections.[2] His family line threatened to die out, and it seems that he felt no little pride in his birth and lineage. 'Both the Flechsigs and the Schrebers were members of "the highest nobility of Heaven", as the phrase went. The Schrebers in particular bore the title of "Margraves of Tuscany and Tasmania"; for souls, urged by some sort of personal vanity, have a custom of adorning themselves with somewhat high-sounding titles borrowed from this world.'[3] (24.) The great Napoleon obtained a divorce from Josephine (though only after severe internal struggles) because she could not propagate the dynasty.[4] Dr Schreber may have formed a phantasy that if he were a woman he would manage the business of having children more successfully; and he may thus have found his way back into the feminine attitude towards his father which he had exhibited in the earliest years of his childhood. If that were so, then his delusion that as a result of his emasculation the world was to be peopled with 'a new race of men, born from the spirit of Schreber' (288) – a delusion the realization of which he was continually postponing to a more and more remote future – would also be designed to offer him an escape from his childlessness. If the 'little men' whom Schreber himself finds so puzzling were children, then we should have no difficulty in understanding why they were collected in such great numbers on his head (158): they were in truth the 'children of his spirit'.[5]

1 [See footnote 1, p. 54 below.]

2 'After my recovery from my first illness I spent eight years with my wife – years, upon the whole, of great happiness, rich in outward honours, and only clouded from time to time by the oft-repeated disappointment of our hope that we might be blessed with children.' (36.)

3 He goes on from this remark, which preserves in his delusions the good-natured irony of his saner days, to trace back through former centuries the relations between the Flechsig and Schreber families. In just the same way a young man who is newly engaged, and cannot understand how he can have lived so many years without knowing the girl he is now in love with, will insist that he really made her acquaintance at some earlier time.

4 In this connection it is worth mentioning a protest entered by the patient against some statements made in the medical report: 'I have never trifled with the idea of obtaining a *divorce*, nor have I displayed any indifference to the maintenance of our marriage tie, such as might be inferred from the expression used in the report to the effect that "I am always ready with the rejoinder that my wife can get a divorce if she likes".' (436.)

5 Cf. what I have said about the method of representing patrilineal descent and about the birth of Athena in my analysis of the 'Rat Man' (1909*d*), *RSE*, **10**, 176–7 *n*. 2.

III
ON THE MECHANISM OF PARANOIA

We have hitherto been dealing with the father complex, which was the [59]
dominant element in Schreber's case and with the wishful phantasy round which the illness centred. But in all of this there is nothing characteristic of the form of disease known as paranoia, nothing that might not be found (and that has not in fact been found) in other kinds of neuroses. The distinctive character of paranoia (or of dementia paranoides) must be sought for elsewhere – namely, in the particular form assumed by the symptoms; and we shall expect to find that this is determined, not by the nature of the complexes themselves, but by the mechanism by which the symptoms are formed or by which repression [*Verdrängung*][T] is brought about. We should be inclined to say that what was characteristically paranoic about the illness was the fact that the patient, as a means of warding off a homosexual wishful phantasy, reacted precisely with delusions of persecution of this kind.

These considerations therefore lend an added weight to the circumstance that we are in point of fact driven by experience to attribute to homosexual wishful phantasies an intimate (perhaps an invariable) relation to this particular form of disease. Distrusting my own experience on the subject, I have during the last few years joined with my friends C. G. Jung of Zürich and Sándor Ferenczi of Budapest in investigating upon this single point a number of cases of paranoid disorder which have come under observation. The patients whose histories provided the material for this enquiry included both men and women, and varied in race, occupation and social standing. Yet we were astonished to find that in all of these cases a defence against a homosexual wish was clearly recognizable at the very centre of the conflict which underlay the disease, and that it was in an attempt to master an unconsciously reinforced current of homosexuality that they had all of them come to grief.[1] This was certainly not what we had expected. Paranoia is [60]
precisely a disorder in which a sexual aetiology is by no means obvious; far from this, the strikingly prominent features in the causation of paranoia, especially among males, are social humiliations and slights.

1 Further confirmation is afforded by Maeder's analysis of a paranoid patient J. B. (1910). The present paper, I regret to say, was completed before I had an opportunity of reading Maeder's work.

But if we go into the matter only a little more deeply, we shall be able to see that the really operative factor in these social injuries lies in the part played in them by the homosexual components of emotional life. So long as the individual is functioning normally and it is consequently impossible to see into the depths of his mental life, we may doubt whether his emotional relations to his neighbours in society have anything to do with sexuality, either actually or in their genesis. But delusions never fail to uncover these relations and to trace back the social feelings to their roots in a directly sensual erotic wish. So long as he was healthy, Dr Schreber, too, whose delusions culminated in a wishful phantasy of an unmistakably homosexual nature, had, by all accounts, shown no signs of homosexuality in the ordinary sense of the word.

I shall now endeavour (and I think the attempt is neither unnecessary nor unjustifiable) to show that the knowledge of psychological processes, which, thanks to psychoanalysis, we now possess, already enables us to understand the part played by a homosexual wish in the development of paranoia. Recent investigations[1] have directed our attention to a stage in the development of the libido which it passes through on the way from auto-erotism to object love.[2] This stage has been given the name of narcissism.[3] What happens is this. There comes a time in the development of the individual at which he unifies his sexual drives (which have hitherto been engaged in auto-erotic activities) in order to obtain a love object; and he begins by taking himself, his own body, as his love object, and only subsequently proceeds from this to the choice of some
[61] person other than himself as his object. This halfway phase between auto-erotism and object love may perhaps be indispensable normally; but it appears that many people linger unusually long in this condition, and that many of its features are carried over by them into the later stages of their development. What is of chief importance in the subject's self thus chosen as a love object may already be the genitals. The line of development then leads on to the choice of an external object with similar genitals – that is, to homosexual object choice – and thence to heterosexuality. People who are manifest homosexuals in later life have, it may be presumed, never emancipated themselves from the binding

1 Sadger (1910) and Freud (1910*c*) [*RSE*, **11**].

2 Freud, *Three Essays on the Theory of Sexuality* (1905*d*). [*RSE*, **7**, 130 *n*. The passage was added in the second edition, 1910.]

3 [In the original this sentence reads: 'This stage has been described as "*Narzissismus*"; I prefer to give it the name of "*Narzissmus*", which may not be so correct, but is shorter and less cacophonous.' – The passage in the second edition of the *Three Essays* referred to in footnote 2 above was probably Freud's first mention of the subject in print. See the Editors' Note to his paper on narcissism (1914*c*), *RSE*, **14**, 61.]

condition that the object of their choice must possess genitals like their own; and in this connection the infantile sexual theories which attribute the same kind of genitals to both sexes exert much influence. [Cf. Freud, 1908*c*; *RSE*, **9**.]

After the stage of heterosexual object choice has been reached, the homosexual tendencies are not, as might be supposed, done away with or brought to a stop; they are merely deflected from their sexual aim and applied to fresh uses. They now combine with portions of the ego drives and, as 'attached' ['*angelehnte*'][1] components, help to constitute the social drives, thus contributing an erotic factor to friendship and comradeship, to *esprit de corps* and to the love of mankind in general. How large a contribution is in fact derived from erotic sources (with the sexual aim inhibited) could scarcely be guessed from the normal social relations of mankind. But it is not irrelevant to note that it is precisely manifest homosexuals, and among them again precisely those that set themselves against an indulgence in sensual acts, who are distinguished by taking a particularly active share in the general interests of humanity – interests which have themselves sprung from a sublimation of erotic drives.

In my *Three Essays on the Theory of Sexuality* [ibid., **7**, 208] I have expressed the opinion that each stage in the development of psychosexuality affords a possibility of 'fixation' and thus of a dispositional [62]
point.[2] People who have not freed themselves completely from the stage of narcissism – who, that is to say, have at that point a fixation which may operate as a disposition to a later illness – are exposed to the danger that some unusually intense wave of libido, finding no other outlet, may lead to a sexualization of their social drives and so undo the sublimations which they had achieved in the course of their development. This result may be produced by anything that causes the libido to flow backwards (i.e. that causes a 'regression'): whether, on the one hand, the libido becomes collaterally reinforced owing to some disappointment over a woman, or is directly dammed up owing to a mishap in social relations with other men – both of these being instances of 'frustration'

1 [In his paper on narcissism (1914*c*), written some three years after the present paper, Freud explained his view that 'the sexual drives are at the outset attached to [*lehnen sich an*] the satisfaction of the ego drives', *RSE*, **14**, 76. From this he derived his '*Anlehnungstypus*' ('attachment' or 'anaclitic type') of object choice. See ibid., **14**, 76 *n*., for a discussion of the 'anaclitic type'. – Cf. also ibid., **14**, 111, and see also ibid., **24**, 57–8, for a discussion of the translation of '*Anlehnung*'.]

2 [This is further explained below at the beginning of the paper on 'The Disposition to Obsessional Neurosis' (1913*i*), p. 313 ff. The whole subject raised in this paragraph is dealt with more fully in that work.]

['*Versagung*']; or whether, on the other hand, there is a general intensification of the libido, so that it becomes too powerful to find an outlet along the channels which are already open to it, and consequently bursts through its banks at the weakest spot.[1] Since our analyses show that paranoics *endeavour to protect themselves against any such sexualization of their social drive cathexes*, we are driven to suppose that the weak spot in their development is to be looked for somewhere between the stages of auto-erotism, narcissism and homosexuality, and that their disposition to illness (which may perhaps be susceptible to more precise definition) must be located in that region. A similar disposition would have to be assigned to patients suffering from Kraepelin's dementia praecox or (as Bleuler has named it) *schizophrenia*;[2] and we shall hope later on to find clues which will enable us to trace back the differences between the two disorders (as regards both the form they take and the course they run) to corresponding differences in the patients' dispositional fixations.

In taking the view, then, that what lies at the core of the conflict in cases of paranoia among males is a homosexual wishful phantasy of *loving a man*, we shall certainly not forget that the confirmation of such an important hypothesis can only follow upon the investigation of a large number [63] of instances of every variety of paranoic disorder. We must therefore be prepared, if need be, to limit our assertion to a single type of paranoia. Nevertheless, it is a remarkable fact that the familiar principal forms of paranoia can all be represented as contradictions of the single proposition: '*I* (a man) *love him* (a man)', and indeed that they exhaust all the possible ways in which such contradictions could be formulated.

The proposition 'I (a man) love him' is contradicted by:

(*a*) Delusions of *persecution*; for they loudly assert:

'I do not *love* him – I *hate* him.'

This contradiction, which must have run thus in the unconscious,[3] cannot, however, become conscious to a paranoic in this form. The mechanism of symptom-formation in paranoia requires that internal perceptions – feelings – shall be replaced by external perceptions. Consequently the proposition 'I hate him' becomes transformed by *projection* into another one: '*He hates* (persecutes) *me*, which will justify

1 [This question is discussed much more fully in Freud's slightly later paper on 'Types of Onset of Neurosis' (1912*c*), p. 227 ff. below. Freud's use of the term 'frustration', which has appeared already on p. 50 above, is considered in the Editors' Note to that paper. See also *RSE*, **24**, 93, for a discussion of the translation of this term ('*Versagung*' = 'frustration').]

2 [Cf. Kraepelin (1896) and Bleuler (1911). See also p. 65 below.]

3 Or in the 'basic language' [p. 21 above], as Schreber would say.

me in hating him.' And thus the impelling unconscious feeling makes its appearance as though it were the consequence of an external perception:

'I do not *love* him – I *hate* him, because HE PERSECUTES ME.'

Observation leaves room for no doubt that the persecutor is someone who was once loved.

(*b*) Another element is chosen for contradiction in *erotomania*, which remains totally unintelligible on any other view:

'I do not love *him* – I love *her*.'

And in obedience to the same need [*Zwang*] for projection, the proposition is transformed into: 'I observe that *she* loves me.'

'I do not love *him* – I love *her*, because SHE LOVES ME.'

Many cases of erotomania might give an impression that they could be satisfactorily explained as being exaggerated or distorted heterosexual fixations, if our attention were not attracted by the circumstance that these infatuations invariably begin, not with any internal perception of loving, but with an external perception of being loved. But in this form of paranoia the intermediate proposition 'I love *her*' can also become conscious, because the contradiction between it and the original proposition is not a diametrical one, not so irreconcilable as that between love and hate: it is, after all, possible to love *her* as well as *him*. It can thus come about that the proposition which has been substituted by projection ('*she loves me*') may make way again for the 'basic language' proposition 'I love *her*'. [64]

(*c*) The third way in which the original proposition can be contradicted would be by delusions of *jealousy*, which we can study in the characteristic forms in which they appear in each sex.

(*α*) Alcoholic delusions of jealousy. The part played by alcohol in this disorder is intelligible in every way. We know that that source of pleasure removes inhibitions and undoes sublimations. It is not infrequently disappointment over a woman that drives a man to drink – but this means, as a rule, that he resorts to the public-house and to the company of men, who afford him the emotional satisfaction which he has failed to get from his wife at home. If now these men become the objects of a strong libidinal cathexis in his unconscious, he will ward it off with the third kind of contradiction:

'It is not *I* who love the man – *she* loves him', and he suspects the woman in relation to all the men whom he himself is tempted to love.

Distortion by means of projection is necessarily absent in this instance, since, with the change of the subject who loves, the whole process is in

any case thrown outside the ego. The fact that the woman loves the men is a matter of external perception to him; whereas the facts that he himself does not love but hates, or that he himself loves not this but that person, are matters of internal perception.

(*β*) Delusions of jealousy in women are exactly analogous.

'It is not *I* who love the women – *he* loves them.' The jealous woman suspects her husband in relation to all the women by whom she is herself attracted owing to her homosexuality and the dispositional effect of her excessive narcissism. The influence of the time of life at which her fixation occurred is clearly shown by the selection of the love objects which she imputes to her husband; they are often old and quite inappropriate for a real love relation – revivals of the nurses and servants and girls who were her friends in childhood, or sisters who were her actual rivals.

Now it might be supposed that a proposition consisting of three terms, such as '*I love him*', could only be contradicted in three different ways. Delusions of jealousy contradict the subject, delusions of persecution
[65] contradict the verb, and erotomania contradicts the object. But in fact a fourth kind of contradiction is possible – namely, one which rejects the proposition as a whole:

'*I do not love at all – I do not love anyone*.' And since, after all, one's libido must go somewhere, this proposition seems to be the psychological equivalent of the proposition: 'I love only myself.' So that this kind of contradiction would give us megalomania, which we may regard as a *sexual overvaluation of the ego* and may thus set beside the overvaluation of the love object with which we are already familiar.[1]

It is of some importance in connection with other parts of the theory of paranoia to notice that we can detect an element of megalomania in most other forms of paranoic disorder. We are justified in assuming that megalomania is essentially of an infantile nature and that, as development proceeds, it is sacrificed to social considerations. Similarly, an individual's megalomania is never so vehemently suppressed as when he is in the grip of an overpowering love:

> Denn wo die Lieb' erwachet, stirbt
> das Ich, der finstere Despot.[2]

1 *Three Essays on the Theory of Sexuality* (1905*d*), *RSE*, 7, 134–5. The same view and the same formulation can be found in the papers by Abraham and Maeder to which I have already referred [pp. 36 *n*. and 51 *n*. above].

2 From the *Ghazals* of Muḥammad ibn Muḥammad (Jalāl al-Dīn) *Rūmi*, translated by Rückert.

> [For when the flames of love arise,
> Then Self, the gloomy tyrant, dies.

In Rückert's version the word '*dunkele*' ('dark') appears in place of '*finstere*'.]

After this discussion of the unexpectedly important part played by homosexual wishful phantasies in paranoia, let us return to the two factors in which we expected from the first to find the distinguishing marks of paranoia, namely, the mechanism *by which the symptoms are formed* and the mechanism *by which repression is brought about* [p. 51 above].

We certainly have no right to begin by assuming that these two mechanisms are identical, and that symptom-formation follows the same path as repression, each proceeding along it, perhaps, in an opposite direction. Nor does there seem to be any great probability that such an identity exists. Nevertheless, we shall refrain from expressing any opinion on the subject until we have completed our investigation. [66]

The most striking characteristic of symptom-formation in paranoia is the process which deserves the name of *projection*. An internal perception is suppressed, and, instead, its content, after undergoing a certain kind of distortion, enters consciousness in the form of an external perception. In delusions of persecution the distortion consists in a transformation of affect; what should have been felt internally as love is perceived externally as hate. We should feel tempted to regard this remarkable process as the most important element in paranoia and as being absolutely pathognomonic for it, if we were not opportunely reminded of two things. In the first place, projection does not play the same part in all forms of paranoia; and, in the second place, it makes its appearance not only in paranoia but under other psychological conditions as well, and in fact it has a regular share assigned to it in our attitude towards the external world. For when we refer the causes of certain sensations to the external world, instead of looking for them (as we do in the case of others) inside ourselves, this normal proceeding, too, deserves to be called projection. Having thus been made aware that more general psychological problems are involved in the question of the nature of projection, let us make up our minds to postpone the investigation of it (and with it that of the mechanism of paranoic symptom-formation in general) until some other occasion;[1] and let us now turn to consider what ideas we can collect on the subject of the mechanism of repression in paranoia. I should like to say at once, in justification of this temporary renunciation, that we shall find that the manner in which the process of repression occurs is far more intimately connected with the

1 [There seems no trace of any such later discussion. Freud may perhaps have dealt with the subject in one of the missing metapsychological papers. See the Editors' Introduction to the 'Papers on Metapsychology', *RSE*, **14**, 93 f.]

developmental history of the libido and with the disposition to which it gives rise than is the manner in which symptoms are formed.

In psychoanalysis we have been accustomed to look upon pathological phenomena as being derived in a general way from repression. If we [67] examine what is spoken of as 'repression' more closely, we shall find reason to split the process up into three phases which are easily distinguishable from one another conceptually.[1]

(1) The first phase consists in *fixation* [*Fixierung*][T], which is the precursor and necessary condition of every 'repression'. Fixation can be described in this way. One drive or drive component fails to accompany the rest along the anticipated normal path of development, and, in consequence of this inhibition in its development [*Entwicklungshemmung*][T], *Hemmung* it is left behind at a more infantile stage. The libidinal current in question then behaves in relation to later psychological structures like one belonging to the system of the unconscious, like one that is repressed. We have already shown [pp. 53–4 above] that these drive fixations constitute the basis for the disposition to subsequent illness, and we may now add that they constitute above all the basis for the determination of the outcome of the third phase of repression.

(2) The second phase of repression is that of repression proper – the phase to which most attention has hitherto been given. It emanates from the more highly developed systems of the ego – systems which are capable of being conscious – and may in fact be described as a process of 'after-pressure'. It gives an impression of being an essentially active process, while fixation appears in fact to be a passive lagging behind. What undergo repression may either be the psychical derivatives of the original lagging drives, when these have become reinforced and so come *Ichgerecht* into conflict with the ego (or ego-syntonic [*ichgerechten*][T] drives), or they may be psychical trends which have for other reasons aroused strong aversion. But this aversion would not in itself lead to repression, unless some connection had been established between the unwelcome trends which have to be repressed and those which have been repressed already. Where this is so, the repulsion exercised by the conscious system and the attraction exercised by the unconscious one tend in the same direction towards bringing about repression. The two possibilities which are here treated separately may in practice, perhaps, be less sharply differentiated, and the distinction between them may merely depend upon

1 [What follows is repeated somewhat differently in the metapsychological paper on 'Repression' (1915*d*), *RSE*, **14**, 130 f. It had already been outlined by Freud in a letter to Ferenczi of December 6, 1910 (Jones, 1955, 499).]

the greater or lesser degree in which the primarily repressed drives [68]
contribute to the result.

(3) The third phase, and the most important as regards pathological phenomena, is that of failure of repression, of *irruption*, of *return of the repressed*. This irruption takes its start from the point of fixation, and it implies a regression of the libidinal development to that point.

We have already [p. 53 above] alluded to the multiplicity of the possible points of fixation; there are, in fact, as many as there are stages in the development of the libido. We must be prepared to find a similar multiplicity of the mechanisms of repression proper and of the mechanisms of irruption (or of symptom-formation), and we may already begin to suspect that it will not be possible to trace back all of these multiplicities to the developmental history of the libido alone.

It is easy to see that this discussion is beginning to trench upon the problem of 'choice of neurosis', which, however, cannot be taken in hand until preliminary work of another kind has been accomplished.[1] Let us bear in mind for the present that we have already dealt with fixation, and that we have postponed the subject of symptom-formation; and let us restrict ourselves to the question of whether the analysis of Schreber's case throws any light upon the mechanism of repression proper which predominates in paranoia.

At the climax of his illness, under the influence of visions which were 'partly of a terrifying character, but partly, too, of an indescribable grandeur' (73), Schreber became convinced of the imminence of a great catastrophe, of the end of the world. Voices told him that the work of the past 14,000 years had now come to nothing, and that the earth's allotted span was only 212 years more (71); and during the last part of his stay in Flechsig's clinic he believed that that period had already elapsed. He himself was 'the only real man left alive', and the few human shapes that he still saw – the doctor, the attendants, the other patients – he explained as being 'miracled up, cursorily improvised men'. Occasionally the converse current of feeling also made itself apparent: a newspaper was put into his hands in which there was a report of his own death (81); he himself existed in a second, inferior shape, and in this second shape he one day quietly passed away (73). But the form of his delusion in which his ego [69]
was retained and the world sacrificed proved itself by far the more powerful. He had various theories of the cause of the catastrophe. At one time he had in mind a process of glaciation owing to the withdrawal of the sun; at another it was to be destruction by an earthquake, in the occurrence of

1 [The problem is further considered on pp. 62 f. and 67 f. below.]

which he, in his capacity of 'seer of spirits', was to act a leading part, just as another seer was alleged to have done in the Lisbon earthquake of 1755 (91). Or again, Flechsig was the culprit, since through his magic arts he had sown fear and terror among men, had wrecked the foundations of religion, and spread abroad general nervous disorders and immorality, so that devastating pestilences had descended upon mankind (91). In any case the end of the world was the consequence of the conflict which had broken out between him and Flechsig, or, according to the aetiology adopted in the second phase of his delusion, of the indissoluble bond which had been formed between him and God; it was, in fact, the inevitable result of his illness. Years afterwards, when Dr Schreber had returned to human society, and could find no trace in the books, the musical scores, or the other articles of daily use which fell into his hands once more, of anything to bear out his theory that there had been a gap of vast duration in the history of mankind, he admitted that his view was no longer tenable: '. . . I can no longer avoid recognizing that, *externally considered*, everything is as it used to be. *Whether, nevertheless, there may not have been a profound internal change* is a question to which I shall return later.' (84–5.) He could not bring himself to doubt that during his illness the world had come to an end and that, in spite of everything, the one that he now saw before him was a different one.

A world catastrophe of this kind is not infrequent during the agitated stage in other cases of paranoia.[1] If we base ourselves on our theory of libidinal cathexis, and if we follow the hint given by Schreber's view of other people as being 'cursorily improvised men', we shall not find it [70] difficult to explain these catastrophes.[2] The patient has withdrawn from the people in his environment and from the external world generally the libidinal cathexis which he has hitherto directed on to them. Thus everything has become indifferent and irrelevant to him, and has to be explained by means of a secondary rationalization as being 'miracled up, cursorily improvised'. The end of the world is the projection of this internal catastrophe; his subjective world has come to an end since his withdrawal of his love from it.[3]

1 An 'end of the world' based upon other motives is to be found at the climax of the ecstasy of love (cf. Wagner's *Tristan und Isolde*); in this case it is not the ego but the single love object which absorbs all the cathexes directed upon the external world. [Freud returned to this point in his paper on narcissism (1914*c*), *RSE*, **14**, 65 f.]

2 Cf. Abraham (1908) and Jung (1907). Abraham's short paper contains almost all the essential views put forward in the present study of the case of Schreber.

3 He has perhaps withdrawn from it not only his libidinal cathexis, but his interest in general – that is, the cathexes that proceed from his ego as well. This question is discussed below [p. 64 ff.].

After Faust has uttered the curses which free him from the world, the Chorus of Spirits sings:

Weh! Weh!
Du hast sie zerstört,
die schöne Welt,
mit mächtiger Faust!
sie stürzt, sie zerfällt!
Ein Halbgott hat sie zerschlagen!
. . . . . .
Mächtiger
der Erdensöhne,
Prächtiger
baue sie wieder,
in deinem Busen baue sie auf![1]

And the paranoic builds it again, not more splendid, it is true, but [71]
at least so that he can once more live in it. He builds it up by the work of his delusions. *The delusional formation, which we take to be the pathological product, is in reality an attempt at recovery, a process of reconstruction.*[2] Such a reconstruction after the catastrophe is successful to a greater or lesser extent, but never wholly so; in Schreber's words, there has been a 'profound internal change' in the world. But the human subject has recaptured a relation, and often a very intense one, to the people and things in the world, even though the relation is a hostile one now, where formerly it was hopefully affectionate. We may say, then, that the process of repression proper consists in a detachment of the libido from people – and things – that were previously loved. It happens silently; we receive no intelligence of it, but can only infer it from

1 [Woe! Woe!
Thou hast it destroyed,
The beautiful world,
With powerful fist!
In ruins 'tis hurled,
By the blow of a demigod shattered!
. . . . . .
Mightier
For the children of men,
More splendid
Build it again,
In thine own bosom build it anew!

Goethe, *Faust*, Part I, Scene 4.
(Bayard Taylor's translation, modified.)]

2 [Freud returned to this idea and extended it to the symptoms of other psychoses below, on p. 66 f., as well as in his paper on narcissism (1914*c*), *RSE*, **14**, 64 and 74 f., in 'The Unconscious' (1915*e*), ibid., **14**, 179–80, and in the metapsychological paper on dreams (1916–17*f* [1915]), ibid., **14**, 204 f.]

subsequent events. What forces itself so noisily upon our attention is the process of recovery, which undoes the work of repression and brings back the libido again on to the people it had abandoned. In paranoia this process is carried out by the method of projection. It was incorrect to say that the perception which was suppressed internally is projected outwards; the truth is rather, as we now see, that what was abolished internally returns from without. The thorough examination of the process of projection which we have postponed to another occasion[1] will clear up our remaining doubts on this subject.

In the meantime, however, it is a source of some satisfaction to find that our newly acquired knowledge involves us in a number of further discussions.

(1) Our first reflection will tell us that it cannot be the case that this detachment of the libido occurs exclusively in paranoia; nor can it be that, where it occurs elsewhere, it has such disastrous consequences. It is quite possible that a detachment of the libido is the essential and regular mechanism of every repression. We can have no positive knowledge on
[72] that point until the other disorders that are based upon repression have been similarly examined. But it is certain that in normal mental life (and not only in periods of mourning) we are constantly detaching our libido in this way from people or from other objects without falling ill. When Faust freed himself from the world by uttering his curses, the result was not a paranoia or any other neurosis but simply a certain general frame of mind. The detachment of the libido, therefore, cannot in itself be the pathogenic factor in paranoia; there must be some special characteristic which distinguishes a paranoic detachment of the libido from other kinds. It is not difficult to suggest what that characteristic may be. What use is made of the libido after it has been set free by the process of detachment? A normal person will at once begin looking about for a substitute for the lost attachment; and until that substitute has been found the liberated libido will be kept in suspension within his mind, and will there give rise to tensions and colour his mood. In hysteria the liberated libido becomes transformed into somatic innervations or into anxiety. But in paranoia the clinical evidence goes to show that the libido, after it has been withdrawn from the object, is put to a special use. It will be remembered [p. 56 above] that the majority of cases of paranoia exhibit traces of megalomania, and that megalomania can by itself constitute a paranoia. From this it may be concluded that in paranoia the liberated libido

1 [See footnote, p. 57 above.]

becomes attached to the ego, and is used for the aggrandizement of the ego.[1] A return is thus made to the stage of narcissism (known to us from the development of the libido), in which a person's only sexual object is his own ego. On the basis of this clinical evidence we can suppose that paranoics have brought along with them a *fixation at the stage of narcissism*, and we can assert that the length of *the step back from sublimated homosexuality to narcissism* is a measure of the amount of *regression* characteristic of paranoia.[2]

(2) An equally plausible objection can be based upon Schreber's case history, as well as upon many others. For it can be urged that the delusions of persecution (which were directed against Flechsig) unquestionably made their appearance at an earlier date than the phantasy of the end of the world; so that what is supposed to have been [73]
a return of the repressed actually preceded the repression itself – and this is patent nonsense. In order to meet this objection we must leave the high ground of generalization and descend to the detailed consideration of actual circumstances, which are undoubtedly very much more complicated. We must admit the possibility that a detachment of the libido such as we are discussing might just as easily be a partial one, a drawing back from some single complex, as a general one. A partial detachment should be by far the commoner of the two, and should precede a general one, since to begin with it is only for a partial detachment that the influences of life provide a motive. The process may then stop at the stage of a partial detachment or it may spread to a general one, which will loudly proclaim its presence in the symptoms of megalomania. Thus the detachment of the libido from the figure of Flechsig may nevertheless have been what was primary in the case of Schreber; it was immediately followed by the appearance of the delusion, which brought back the libido on to Flechsig again (though with a negative sign to mark the fact that repression had taken place) and thus annulled the work of repression. And now the battle of repression broke out anew, but this time with more powerful weapons. In proportion as the object of contention became the most important thing in the external world, trying on the one hand to draw the whole of the libido on to itself, and on the other hand mobilizing all the resistances against itself, so the struggle raging around this single object became more and more comparable to a general engagement; till at length a victory for the forces of repression found expression

1 [The part played by megalomania in schizophrenia is further investigated in the paper on narcissism (1914*c*), *RSE*, **14**, 74 f.]

2 [See further 'The Disposition to Obsessional Neurosis' (1913*i*), p. 314 below.]

in a conviction that the world had come to an end and that the self alone survived. If we review the ingenious constructions which were raised by Schreber's delusion in the domain of religion – the hierarchy of God, the proved souls, the forecourts of Heaven, the lower and the upper God – we can gauge in retrospect the wealth of sublimations which were brought down in ruin by the catastrophe of the general detachment of his libido.

(3) A third consideration which arises from the views that have been developed in these pages is as follows. Are we to suppose that a general detachment of the libido from the external world would be an effective enough agent to account for the 'end of the world'? Or would not the
[74] ego cathexes [*Ichbesetzungen*][1] which still remained in existence have been sufficient to maintain rapport with the external world? To meet this difficulty we should either have to assume that what we call libidinal cathexis (that is, interest emanating from erotic sources) coincides with interest in general, or we should have to consider the possibility that a very widespread disturbance in the distribution of libido may bring about a corresponding disturbance in the ego cathexes. But these are problems which we are still quite helpless and incompetent to solve. It would be otherwise if we could start out from some well-grounded theory of drives; but, in fact, we have nothing of the kind at our disposal. We regard drive as being a concept on the frontier between the somatic and the mental, and see in it the psychical representative [*Repräsentanten*] of organic forces [*Mächte*][T].[2] Further, we accept the popular distinction between ego drives and a sexual drive; for such a distinction seems to agree with the biological conception that the individual has a double orientation, aiming, on the one hand, at self-preservation and, on the other, at the preservation of the species. But beyond this are only hypotheses, which we have taken up – and are quite ready to drop again – in order to help us to find our bearings in the chaos of the obscurer processes of the mind. What we expect from

1 [This German word, which occurs twice more in what follows, is unfortunately ambiguous. It may mean either 'cathexes *of* the ego' or 'cathexes *by* the ego'. The ambiguity remains in the English 'ego cathexes'. There can, however, be no doubt that in the present context the second of the two possible meanings, 'cathexes *by* the ego', is intended. The word is the equivalent of what is elsewhere called '*Ichinteresse*' ('ego interest'), e.g. in the paper on narcissism, *RSE*, **14**, 71. This is directly implied, indeed, in the very next sentence, and has moreover been explicitly stated in footnote 3, p. 60 above. Occasionally Freud uses the word in its other possible sense – to mean 'cathexis *of* the ego'. Thus, for instance, he speaks of '*die Ichbesetzung mit Libido*' ('the cathexis of the ego with libido'), once again in the paper on narcissism (ibid., **14**, 74). This ambiguity, unless it is borne in mind, may open the door to serious confusion.]

2 [A discussion of this and other questions raised in this paragraph can be found in the Editors' Note to the metapsychological paper on 'Drives and their Vicissitudes' (1915*c*), ibid., **14**, 99 ff.]

psychoanalytic investigations of pathological mental processes is precisely that they shall impose on us some decisions regarding questions connected with drive theory. These investigations, however, are in their infancy and are only being carried out by isolated workers, so that the hopes we place in them must still remain unfulfilled. We can no more [75]
dismiss the possibility that disturbances of the libido may react upon the ego cathexes than we can overlook the converse possibility – namely, that a secondary or induced disturbance of the libidinal processes may result from abnormal changes in the ego. Indeed, it is probable that processes of this kind constitute the distinctive characteristic of psychoses. How much of all this may apply to paranoia it is impossible at present to say. There is one consideration, however, on which I should like to lay stress. It cannot be asserted that a paranoic, even at the height of the repression, withdraws his interest from the external world completely – as must be considered to occur in certain other kinds of hallucinatory psychosis (such as Meynert's amentia). The paranoic perceives the external world and takes into account any alterations that may happen in it, and the effect it makes upon him stimulates him to invent explanatory theories (such as Schreber's 'cursorily improvised men'). It therefore appears to me far more probable that the paranoic's altered relation to the world is to be explained entirely or in the main by the loss of his libidinal interest.[1]

(4) It is impossible to avoid asking, in view of the close connection between the two disorders, how far this conception of paranoia will affect our conception of dementia praecox. I am of the opinion that Kraepelin was entirely justified in taking the step of separating off a large part of what had hitherto been called paranoia and merging it, together with catatonia and certain other forms of disease, into a new clinical entity – though 'dementia praecox' was a particularly unhappy name to choose for it. The designation chosen by Bleuler for the same group of forms – 'schizophrenia' – is also open to the objection that the name appears appropriate only so long as we forget its literal meaning.[2] For otherwise it prejudices the issue, since it is based on a characteristic of the disease which is theoretically postulated – a characteristic, moreover, which does not belong exclusively to that disease, and which, in the light of other considerations, cannot be regarded as the essential one. However, it is not on the whole of very great importance what names we give [76]

1 [This paragraph was the basis of criticisms by Jung which are discussed by Freud at the end of the first section of his paper on narcissism (1914*c*), *RSE*, **14**, 69–70.]

2 [I.e. 'split mind'.]

to clinical pictures. What seems to me more essential is that paranoia should be maintained as an independent clinical type, however frequently the picture it offers may be complicated by the presence of schizophrenic features. For, from the standpoint of the libido theory, while it would resemble dementia praecox insofar as the repression proper would in both disorders have the same principal feature – detachment of the libido, together with its regression on to the ego – it would be distinguished from dementia praecox by having its dispositional fixation differently located and by having a different mechanism for the return of the repressed (that is, for the formation of symptoms). It would seem to me the most convenient plan to give dementia praecox the name of *paraphrenia*. This term has no special connotation, and it would serve to indicate a relationship with paranoia (a name which cannot be changed) and would further recall hebephrenia, an entity which is now merged in dementia praecox. It is true that the name has already been proposed for other purposes; but this need not concern us, since the alternative applications have not passed into general use.[1]

[77] Abraham has very convincingly shown[2] that the turning away of the libido from the external world is a particularly clearly marked feature in dementia praecox. From this feature we infer that the repression is effected by means of detachment of the libido. Here once more we may regard the phase of violent hallucinations as a struggle between repression and an attempt at recovery by bringing the libido back again on to its objects. [Cf. p. 62 above.] Jung, with extraordinary analytic acumen, has perceived that the deliria[3] and motor stereotypies occurring in this

1 [Freud's suggestion, as introduced for the first time in this passage, seemed evidently to be that the term 'paraphrenia' should replace 'dementia praecox' and 'schizophrenia', and should be distinct from the kindred 'paranoia'. He continued to use the term in this sense – for instance, in the technical paper 'On Beginning the Treatment' (1913*c*), p. 122 below. Not long afterwards, however, he began to use it in a wider sense, as a combined term to cover *both* 'dementia praecox' *and* 'paranoia'. This is made quite clear in the paper on narcissism (1914*c*), in which (*RSE*, **14**, 71) he classes dementia praecox and paranoia together as 'the paraphrenias' and (ibid., 75) distinguishes 'dementia praecox or paraphrenia proper' from 'paranoia'. That the change in meaning was made deliberately is shown by a passage in 'The Disposition to Obsessional Neurosis' (1913*i*), p. 314 below. Here, in the first edition of the paper, published at the end of 1913, Freud spoke of 'the two other psychoneuroses, which are termed by me paraphrenia and paranoia'. But when the paper was reprinted in 1918, the last clause was altered to 'which I have brought together under the heading of "paraphrenia"'. Finally, in Lecture XXVI of the *Introductory Lectures* (1916–17*a*), *RSE*, **16**, 374, he wrote: 'I once ventured to suggest that paranoia and dementia praecox should be brought together under the common designation of "paraphrenia".' Thereafter, however, he seems to have dropped his attempt to introduce the term.]

2 In the paper already quoted [p. 60 *n.* 2].

3 [In French and German psychiatry the word 'delirium' is often used of delusional states. See also Freud's use of it in the 'Rat Man' case history (1909*d*), *RSE*, **10**, 169.]

disorder are the residues of former object cathexes, clung to with great persistence.[1] This attempt at recovery, which observers mistake for the disease itself, does not, as in paranoia, make use of projection, but employs a hallucinatory (hysterical) mechanism. This is one of the two major respects in which dementia praecox differs from paranoia; and this difference can be explained genetically from another direction.[2] The second difference is shown by the outcome of the disease in those cases where the process has not remained too restricted. The prognosis is on the whole more unfavourable than in paranoia. The victory lies with repression and not, as in the former, with reconstruction. The regression extends not merely to narcissism (manifesting itself in the shape of megalomania) but to a complete abandonment of object love and a return to infantile auto-erotism. The dispositional fixation must therefore be situated further back than in paranoia, and must lie somewhere at the beginning of the course of development from auto-erotism to object love. Moreover, it is not at all likely that homosexual impulsions, which are so frequently – perhaps invariably – to be found in paranoia, play an equally important part in the aetiology of that far more comprehensive disorder, dementia praecox.

Our hypotheses as to the dispositional fixations in paranoia and paraphrenia make it easy to see that a case may begin with paranoic symptoms and may yet develop into a dementia praecox, and that paranoid and schizophrenic phenomena may be combined in any proportion. And we can understand how a clinical picture such as Schreber's can [78] come about, and merit the name of a paranoid dementia, from the fact that in its production of a wishful phantasy and of hallucinations it shows paraphrenic traits, while in its exciting cause, in its use of the mechanism of projection, and in its outcome it exhibits a paranoid character. For it is possible for several fixations to be left behind in the course of development, and each of these in succession may allow an irruption of the libido that has been pushed off – beginning, perhaps, with the later acquired fixations, and going on, as the illness develops, to the original ones that lie nearer the starting point.[3] We should be glad to know to what conditions the relatively favourable issue of the present case is due; for we cannot willingly attribute the whole responsibility for the

1 [Cf. Jung (1908).]

2 [The genetic explanation of the difference appears three sentences lower down – in the earlier dispositional fixation in the case of dementia praecox.]

3 [A case of this pattern, which changed from a hysteria to an obsessional neurosis, plays a large part in the paper on 'The Disposition to Obsessional Neurosis' (1913*i*), written by Freud not long after the present work (p. 315 ff. below).]

outcome to anything so casual as the 'improvement due to change in domicile',[1] which set in after the patient's removal from Flechsig's clinic. But our insufficient acquaintance with the intimate circumstances of the history of the case makes it impossible to give an answer to this interesting question. It may be suspected, however, that what enabled Schreber to reconcile himself to his homosexual phantasy, and so made it possible for his illness to terminate in something approximating to a recovery, may have been the fact that his father complex was in the main positively toned and that in real life the later years of his relationship with an excellent father had probably been unclouded.

Since I neither fear the criticism of others nor shrink from criticizing myself, I have no motive for avoiding the mention of a similarity which may possibly damage our libido theory in the estimation of many of my readers. Schreber's 'rays of God', which are made up of a condensation of the sun's rays, of nerve fibres, and of spermatozoa [p. 20 above], are in reality nothing else than a concrete representation and projection outwards of libidinal cathexes; and they thus lend his delusions a striking conformity with our theory. His belief that the world must come to an
[79] end because his ego was attracting all the rays to itself, his anxious concern at a later period, during the process of reconstruction, lest God should sever His ray-connection with him – these and many other details of Schreber's delusional structure sound almost like endopsychic perceptions of the processes whose existence I have assumed in these pages as the basis of our explanation of paranoia. I can nevertheless call a friend and fellow specialist to witness that I had developed my theory of paranoia before I became acquainted with the contents of Schreber's book. It remains for the future to decide whether there is more delusion in my theory than I should like to admit, or whether there is more truth in Schreber's delusion than other people are as yet prepared to believe.

Lastly, I cannot conclude the present work, which is once again only a fragment of a larger whole, without foreshadowing the two chief theses towards the establishment of which the libido theory of the neuroses and psychoses is advancing: namely, that the neuroses arise in the main from a conflict between the ego and the sexual drive, and that the forms which the neuroses assume retain the imprint of the course of development followed by the libido – and by the ego.

POSTSCRIPT
(1912 [1911])

In dealing with the case history of Senatspräsident Schreber[1] I purposely [80]
restricted myself to a minimum of interpretation; and I feel confident that every reader with a knowledge of psychoanalysis will have learnt from the material which I presented more than was explicitly stated by me, and that he will have found no difficulty in drawing the threads closer and in reaching conclusions at which I no more than hinted. By a happy chance the same issue of this periodical as that in which my own paper appeared showed that the attention of some other contributors had been directed to Schreber's autobiography, and made it easy to guess how much more material remains to be gathered from the symbolic content of the phantasies and delusions of this gifted paranoic.[2]

Since I published my work upon Schreber, a chance acquisition of knowledge has put me in a position to appreciate one of his delusional beliefs more adequately, and to recognize the wealth of its bearing upon *mythology*. I mentioned on p. 46 the patient's peculiar relation to the sun, and I was led to explain the sun as a sublimated 'father symbol'. The sun used to speak to him in human language and thus revealed itself to him as a living being. Schreber was in the habit of abusing it and shouting threats at it; he declares, moreover, that, when he stood facing it and spoke aloud, its rays would turn pale before him. After his 'recovery' he boasts that he can gaze at it without any difficulty and without being more than slightly dazzled by it, a thing which would naturally have been impossible for him formerly.[3]

It is to this delusional privilege of being able to gaze at the sun without being dazzled that the mythological interest attaches. We read in Reinach[4] that the natural historians of antiquity attributed this power to [81]
the eagle alone, who, as a dweller in the highest regions of the air, was brought into especially intimate relation with the heavens, with the sun,

1 [In the first edition only, the following footnote appeared at this point: 'See my paper in the first half-volume of the *Jahrbuch* (Vol. III), which is based on the *Denkwürdigkeiten eines Nervenkranken*.']

2 Cf. Jung (1911–12, 164 and 207); and Spielrein (1911, 350).

3 See the footnote to page 139 of Schreber's book [which is quoted above on p. 47 *n*. 1].

4 Reinach (1905–12, **3**, 80), quoting Keller (1887, [268]).

and with lightning.[1] We learn from the same sources, moreover, that the eagle puts his young to a test before recognizing them as his legitimate offspring. Unless they can succeed in looking into the sun without blinking they are thrown out of the eyrie.

There can be no doubt about the meaning of this animal myth. It is certain that this is merely ascribing to animals something that is a hallowed custom among men. The procedure gone through by the eagle with his young is an *ordeal*, a test of lineage, such as is reported of the most various races of antiquity. Thus the Celts living on the banks of the Rhine used to entrust their newborn babies to the waters of the river, in order to ascertain whether they were truly of their own blood. The clan of Psylli, who inhabited what is now Tripoli, boasted that they were descended from snakes, and used to expose their infants to contact with them; those who were true-born children of the clan either were not bitten or recovered rapidly from the effects of the bite.[2] The assumption underlying these trials leads us deep into the *totemic* habits of thought of primitive peoples. The totem – an animal, or a natural force animistically conceived, to which the tribe traces back its origin – spares the members of the tribe as being its own children, just as it itself is honoured by them as being their ancestor and is spared by them. We have here arrived at the consideration of matters which, as it seems to me, may make it possible to arrive at a psychoanalytic explanation of the origins of religion.[3]

The eagle, then, who makes his young look into the sun and requires of them that they shall not be dazzled by its light, is behaving as though he were himself a descendant of the sun and were submitting his children to a test of their ancestry. And when Schreber boasts that he can look into the sun unscathed and undazzled, he has rediscovered the mythological
[82] method of expressing his filial relation to the sun, and has confirmed us once again in our view that the sun is a symbol of the father. It will be remembered that during his illness Schreber gave free expression to his family pride,[4] and that we discovered in the fact of his childlessness a human motive for his having fallen ill with a feminine wishful phantasy

1 Representations of eagles were set up at the highest points of temples, so as to serve as 'magical' lightning conductors. (Cf. Reinach, loc. cit.)

2 For lists of references see Reinach, loc. cit. and ibid., **1**, 74.

3 [Freud followed up this line of thought not long afterwards in his *Totem and Taboo* (1912–13*a*), *RSE*, **13**.]

4 The Schrebers are 'members of the highest nobility of Heaven' (24). [See above, p. 50.] – '*Adel*' is related to '*Adler*'. ['*Adel*' means 'nobility' or 'noble'. '*Adler*' means 'eagle'.]

[p. 50 above]. Thus the connection between his delusional privilege[1] and the basis of his illness becomes evident.

This short postscript to my analysis of a paranoid patient may serve to show that Jung had excellent grounds for his assertion that the mythopoeic forces of mankind are not extinct, but that to this very day they give rise in the neuroses to the same psychical products as in the remotest past ages. I should like to take up a suggestion that I myself made some time ago,[2] and add that the same holds good of the forces that construct religions. And I am of the opinion that the time will soon be ripe for us to make an extension of a thesis which has long been asserted by psychoanalysts, and to complete what has hitherto had only an individual and ontogenetic application by the addition of its anthropological counterpart, which is to be conceived phylogenetically. 'In dreams and in neuroses', so our thesis has run, 'we come once more upon the *child* and the peculiarities which characterize his modes of thought and his emotional life.' 'And we come upon the *savage* too,' we may now add, 'upon the *primitive* man, as he stands revealed to us in the light of the researches of archaeology and of ethnology.'

1 [Of being able to look into the sun.]

Papers on Technique

(1911–15 [1911–14])

PAPERS ON TECHNIQUE

EDITORS' INTRODUCTION

In his contribution to *Studies on Hysteria* (1895*d*), Freud gave a very full account of [85]
the psychotherapeutic procedure which he had evolved on the basis of Breuer's discoveries. This may be described as the 'pressure' technique and it still included considerable elements of suggestion, though it was advancing rapidly towards what he was soon to call the 'psychoanalytic' method. An examination of the list of Freud's technical writings printed below (p. 171) will show that after this, apart from two very sketchy accounts dating from 1903 and 1904, he published no general description of his technique for more than fifteen years. What little we know of his methods during this period has mainly to be inferred from incidental remarks – for instance, in *The Interpretation of Dreams* (1900*a*) – and more particularly from what is revealed in his three major case histories of the period, 'Dora' (1905*e* [1901]), 'Little Hans' (1909*b*) and the 'Rat Man' (1909*d*). (The two last of these, incidentally, fall very near the end of this period of relative silence.) We learn from Jones (1955, 258 ff.) that already in 1908 Freud was toying with the idea of writing an *Allgemeine Technik der Psychoanalyse* (*A General Account of Psychoanalytic Technique*). It was intended to run to some fifty pages, and thirty-six of these had already been written by the end of the year. But at this point there was a hold-up, and he decided to put off finishing it until the summer vacation of 1909. But when this arrived, there was the 'Rat Man' paper to complete and the visit to America to prepare for, and the work on technique was once again left on one side. Nevertheless, during that same summer Freud told Jones that he was planning 'a little memorandum of maxims and rules of technique', which was to be distributed privately among his closest followers only. Thereafter nothing more was heard on the subject until the paper on 'The Future Prospects of Psychoanalytic Therapy', which he read at the end of March of the following year to the Nuremberg Congress (1910*d*). In that paper, which itself touched on the question of technique, he announced that he intended 'in the near future' to produce an [86]
Allgemeine Methodik der Psychoanalyse (*A General Methodology of Psychoanalysis*) – presumably a systematic work on technique (*RSE*, **11**, 130). But once again, except for the critical comment on 'wild' analysis written a few months later (1910*k*), there was a delay of over eighteen months, and it was not until the end of 1911 that a start was made with the publication of the following six papers.

The first four of them were published in fairly rapid succession over the next fifteen months (between December, 1911, and March, 1913). There was then another pause, and the last two papers of the series appeared in November, 1914, and January, 1915. These two, however, were actually finished by the end of July, 1914 – just before the outbreak of the First World War. Although the six papers were thus spread over

some two and a half years, Freud seems to have regarded them as forming a series, as can be seen from the footnote to the fourth of them (p. 121 *n.* 1 below) and the fact that the last four originally shared a common title; moreover, he reprinted them together in his fourth collection of shorter papers in 1918 under the heading 'Zur Technik der Psychoanalyse' ('On the Technique of Psychoanalysis'). We have therefore thought it right in this instance to disregard chronology and include the whole series in the present volume.

Though these six papers cover a great number of important subjects, they can scarcely be described as a systematic exposition of the psychoanalytic technique. They nevertheless represent Freud's nearest approach to one, for in the twenty years that followed their publication he made no more than a couple more explicit contributions to the subject: a discussion of 'active' methods of treatment in his Budapest Congress paper (1919*a* [1918]) and a few pieces of practical advice on dream interpretation (1923*c*). Beyond these, we have chiefly to rely as before on incidental matter in case histories, in particular in the 'Wolf Man' analysis (1918*b* [1914]), which was more or less contemporary with the present papers. In addition, there is, of course, the long statement of the principles underlying psychoanalytic therapy in Lectures XXVII and XXVIII of his *Introductory Lectures* (1916–17*a*), though this is perhaps hardly to be regarded as a direct contribution to questions of technique. It was
[87] indeed only at the very end of his life, in 1937, that he once more returned to that topic in two important papers of an explicitly technical nature (1937*c* and 1937*d*).

The relative paucity of Freud's writings on technique, as well as his hesitations and delays over their production, suggests that there was some feeling of reluctance on his part to publishing this kind of material. And this, indeed, seems to have been the case, for a variety of reasons. He certainly disliked the notion of future patients knowing too much about the details of his technique, and he was aware that they would eagerly scan whatever he wrote on the subject. (This feeling is exemplified by his proposal, mentioned above, to restrict the circulation of a work on technique to a limited number of analysts.)[1] But, apart from this, he was highly sceptical as to the value to beginners of what might be described as 'Aids to Young Analysts'. It is only in the third and fourth papers in this series that anything at all resembling that is to be found. This was in part because, as he tells us in the paper 'On Beginning the Treatment', the psychological factors involved (including the personality of the analyst) are too complex and variable to make any hard and fast rules possible. Such rules could be of value only if the grounds for them were properly understood and digested; and, in fact, a very large part of these papers is devoted to an exposition of the mechanism of psychoanalytic therapy and, indeed, of psychotherapy in general. Once this mechanism was grasped, it became possible to account for the reactions of the patient (and of the analyst) and to form a judgement upon the probable effects and merits of any particular technical device.

Behind all his discussions of technique, however, Freud never ceased to insist that a proper mastery of the subject could only be acquired from clinical experience and not from books. Clinical experience with patients, no doubt, but, above all, clinical experience from the analyst's own analysis. This, as Freud became more and more convinced, was the fundamental necessity for every practising psychoanalyst. He

1 The absence of any full discussion in his writings of the phenomenon of 'countertransference' (see below, p. 160 *n.*) may perhaps be taken as another example of this feeling.

had put forward this idea rather tentatively at first, e.g. in 'The Future Prospects of Psychoanalytic Therapy' (1910*d*), *RSE*, **11**, 132; it is expressed more definitely in one of the present series (p. 111 ff. below); and in one of his very last writings, 'Analysis Terminable and Interminable' (1937*c*), *RSE*, **23**, he lays it down that every analyst [88] ought periodically, perhaps every five years, to re-enter analysis. The papers on technique which follow clearly have to be read with a constant sense of this governing condition behind them.

Finally, it may be remarked that in the present series of papers Freud makes no reference to the question of whether the possession of a medical qualification is an equally necessary attribute of every psychoanalyst. In these papers it seems to be taken for granted that the analyst will be a doctor and he is far more often than not spoken of as such: the word '*Arzt*' – 'physician' or 'doctor' – is scattered plentifully over them. Freud's first published approach to the possible emergence of non-medical psychoanalysts was, in fact, contemporaneous with the last of these papers and can be found below (p. 328 f.) in his Introduction to a book by Pfister. His main discussions of the subject came much later, in his brochure on lay analysis (1926*e*)[1] and his postscript to it (1927*a*). It may be conjectured that, if he had written the present papers later in his career, the word '*Arzt*' would have occurred less frequently. Indeed, in his last two papers on technique (1937*c* and 1937*d*) it does not occur at all: its place is everywhere taken by '*Analytiker*' – 'analyst'.

1 There are, incidentally, considerable borrowings from the present series of papers, sometimes almost word for word, in Chapter V of that work.

THE HANDLING OF DREAM INTERPRETATION IN PSYCHOANALYSIS

(1911)

The present translation is a revised and corrected reprint of the *SE* translation.

The paper was first published in December, 1911. Its topic, as the title implies, is a restricted one: it is concerned with dreams solely as they appear in a therapeutic analysis. Some further contributions to the same subject can be found in Sections I to VIII of 'Remarks on the Theory and Practice of Dream Interpretation' (1923*c*), *RSE*, **19**.

THE HANDLING OF DREAM INTERPRETATION IN PSYCHOANALYSIS

The *Zentralblatt für Psychoanalyse*[1] was not designed solely to keep its readers informed of the advances made in psychoanalytic knowledge, and itself to publish comparatively short contributions to the subject;[2] it aims also at accomplishing the further tasks of presenting to the student a clear outline of what is already known, and of economizing the time and efforts of beginners in analytic practice by offering them suitable instructions. Henceforward, therefore, articles of a didactic nature and on technical subjects, not necessarily containing new matter, will appear as well in this journal. [91]

The question with which I now intend to deal is not that of the technique of dream interpretation [*Traumdeutung*][T]: neither the methods by which dreams should be interpreted nor the use of such interpretations when made will be considered, but only the way in which the analyst should employ the art of dream interpretation in the psychoanalytic treatment of patients. There are undoubtedly different ways of going to work in the matter, but then the answer to questions of technique in analysis is never a matter of course. Although there may perhaps be more than one good road to follow, still there are very many bad ones, and a comparison of the various methods cannot fail to be illuminating, even if it should not lead to a decision in favour of any particular one. *Deutung*

Anyone coming from dream interpretation to analytic practice will retain his interest in the content of dreams, and his inclination will be to interpret as fully as possible every dream related by the patient. But he will soon remark that he is now working under quite different conditions, and that if he attempts to carry out his intention he will come into collision with the most immediate tasks of the treatment. Even if a patient's first dream proves to be admirably suited for the introduction of the first explanations to be given, other dreams will promptly appear, so long and so obscure that the full meaning cannot be extracted from [92]

1 [The periodical in which this paper first appeared.]

2 [Longer papers were published in the *Jahrbuch*. See *RSE*, **14**, 41.]

them in the limited session of one day's work. If the doctor continues the work of interpretation during the following days, fresh dreams will be produced in the meantime and these will have to be put aside until he can regard the first dream as finally resolved. The production of dreams is at times so copious, and the patient's progress towards comprehension of them so hesitant, that a suspicion will force itself on the analyst that the appearance of the material in this manner may be simply a manifestation of the patient's resistance taking advantage of the discovery that the method is unable to master what is so presented. Moreover, the treatment will meanwhile have fallen quite a distance behind the present and have lost touch with actuality. In opposition to such a technique stands the rule that it is of the greatest importance for the treatment that the analyst should always be aware of the surface of the patient's mind at any given moment, that he should know what complexes and resistances are active in him at the time and what conscious reaction to them will govern his behaviour. It is scarcely ever right to sacrifice this therapeutic aim to an interest in dream interpretation.

What then, if we bear this rule in mind, is to be our attitude to interpreting dreams in analysis? More or less as follows: The amount of interpretation which can be achieved in one session should be taken as sufficient and it is not to be regarded as a loss if the content of the dream is not fully discovered. On the following day, the interpretation of the dream is not to be taken up again as a matter of course, until it has become evident that nothing else has meanwhile forced its way into the foreground of the patient's thoughts. Thus no exception in favour of an interrupted dream interpretation is to be made to the rule that the first thing that comes into the patient's head is the first thing to be dealt with. If fresh dreams occur before the earlier ones have been disposed of, the more recent productions are to be attended to, and no uneasiness need be felt about neglecting the older ones. If the dreams become altogether too diffuse and voluminous, all hope of completely unravelling them should tacitly be given up from the start. One must in general guard against displaying very special interest in the interpretation of dreams,
[93] or arousing an idea in the patient that the work would come to a standstill if he were to bring up no dreams; otherwise there is a danger of the resistance being directed to the production of dreams, with a consequent cessation of them. The patient must be brought to believe, on the contrary, that the analysis invariably finds material for its continuation, regardless of whether or <u>not</u> he brings up dreams or what amount of attention is devoted to them.

It will now be asked whether we shall not be giving up too much valuable material which might throw light on the unconscious if dream interpretation is only to be carried out subject to such restrictions of method. The answer to this is that the loss is by no means so great as might appear from a superficial view of the matter. To begin with, it must be recognized that in cases of severe neurosis any elaborate dream productions must from the nature of things be regarded as incapable of complete solution. A dream of this kind is often based on the entire pathogenic material of the case, as yet unknown to both doctor and patient (so-called 'programme dreams' and biographical dreams[I]), and is sometimes equivalent to a translation [*Übersetzung*][T] into dream language of the whole content of the neurosis. In the attempt to interpret such a dream all the latent, as yet untouched, resistances will be roused to activity and soon set a limit to its understanding. The full interpretation of such a dream will coincide with the completion of the whole analysis; if a note is made of it at the beginning, it may be possible to understand it at the end, many months later. It is the same as with the elucidation of a single symptom (the main symptom, perhaps). The whole analysis is needed to explain it; in the course of the treatment one must endeavour to lay hold first of this, then of that, fragment of the symptom's meaning, one after another, until they can all be pieced together. Similarly, no more can be expected of a dream occurring in the early stages of the analysis; one must be content if the attempt at interpretation brings a single pathogenic wishful impulse [*Wunschregung*][T] to light.[2] *Regung*

Thus nothing attainable is renounced if one gives up the idea of a complete dream interpretation; nor is anything lost as a rule if one [94] breaks off the interpretation of a comparatively old dream and turns to a more recent one. We have found from fine examples of fully analysed dreams that several successive scenes of one dream may have the same content, which may find expression in them with increasing clarity; and we have learnt, too, that several dreams occurring in the same night need be nothing more than attempts, expressed in various forms, to represent one meaning.[3] In general, we may rest assured that every wishful impulse which creates a dream today will reappear in other dreams as long as it has not been understood and withdrawn

1 [See *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 312 and 327 *n*. 1.]

2 [For a long discussion of the limits to the possibility of interpreting dreams see Section A of 'Some Additional Notes on Dream Interpretation as a Whole' (1925*i*), ibid., **19**.]

3 [See *The Interpretation of Dreams*, ibid., **5**, 469.]

from the domination of the unconscious. It often happens, therefore, that the best way to complete the interpretation of a dream is to leave it and to devote one's attention to a new dream, which may contain the same material in a possibly more accessible form. I know that it is asking a great deal, not only of the patient but also of the doctor, to expect them to give up their conscious purposive aims during the treatment, and to abandon themselves to a guidance which, in spite of everything, still seems to us 'accidental'. But I can answer for it that one is rewarded every time one resolves to have faith in one's own theoretical principles, and prevails upon oneself not to dispute the guidance of the unconscious in establishing connecting links.

I submit, therefore, that dream interpretation should not be pursued in analytic treatment as an art for its own sake, but that its handling should be subject to those technical rules that govern the conduct of the treatment as a whole. Occasionally, of course, one can act otherwise and allow a little free play to one's theoretical interest; but one should always be aware of what one is doing. Another situation to be considered is one which has arisen since we have acquired more confidence in our understanding of dream symbolism, and know ourselves to be more independent of the patient's associations [*Einfällen*][T]. An unusually skilful dream interpreter will sometimes find himself in the position of being able to see through every one of a patient's dreams without requiring him to go through the tedious and time-absorbing process of working over them. Such an analyst is thus exempt from any conflict between the demands of dream interpretation and those of the treatment. Moreover, he will be tempted to make full use of
[95] dream interpretation on every occasion, by telling the patient everything he has detected in his dreams. In doing so, however, he will have adopted a method of treatment which departs considerably from the established one, as I shall point out in another connection.[1] Beginners in psychoanalytic practice, at any rate, are advised not to take this exceptional case as a model.

Every analyst is in the position of the superior dream interpreter, whom we have been imagining, in regard to the very first dreams that his patients bring, before they have learnt anything of the technique of translating dreams. These initial dreams may be described as unsophisticated: they betray a great deal to the listener, like the dreams of so-called healthy people. The question then arises whether the analyst is at once

1 [This is possibly a reference to a passage in the paper 'On Beginning the Treatment', p. 136 f. below.]

to translate to the patient all that he himself reads from them. This, however, is not the place for answering this question, for it evidently forms part of a wider one: at what stage in the treatment and how rapidly should the analyst introduce the patient to the knowledge of what lies veiled in his mind?[1] The more the patient has learnt of the practice of dream interpretation, the more obscure do his later dreams as a rule become. All the knowledge acquired about dreams serves also to put the dream-constructing process on its guard.

In the 'scientific' works about dreams, which in spite of their repudiation of dream interpretation have received a new stimulus from psychoanalysis, one constantly finds that scrupulous care is most unnecessarily attached to the accurate preservation of the text of the dream. This is supposed to need protection from distortions and attritions in the hours immediately after waking. Some psychoanalysts, even, in giving the patient instructions to write down every dream immediately upon waking, seem not to rely consistently enough upon their knowledge of the conditions of dream formation. In therapeutic work this rule is superfluous;[2] and patients are glad to make use of it to disturb their sleep and to display great zeal where it can serve no useful purpose. For even if the text of a dream is in this [96] way laboriously rescued from oblivion, it is easy enough to convince oneself that nothing has been achieved for the patient. Associations will not come to the text, and the result is the same as if the dream had not been preserved. No doubt the doctor has acquired some knowledge which he would not have done otherwise. But it is not the same thing whether the analyst knows something or the patient knows it; the importance of this distinction for the technique of psychoanalysis will be more fully considered elsewhere.[3]

In conclusion, I will mention a particular type of dream which, in the nature of the case, occurs only in the course of psychoanalytic treatment, and may bewilder or mislead beginners. These are the corroborative dreams which, as it were, 'tag along behind';[4] they are easily accessible to analysis, and their translation [*Übersetzung*] merely presents what the treatment has inferred during the last few days from the

1 [This is dealt with in the paper 'On Beginning the Treatment', p. 135 ff. below.]

2 [For *scientific* purposes, and in the analysis of his own dreams, Freud wrote down their text. See, for instance, *The Interpretation of Dreams* (1900*a*), *RSE*, **4**, 95, and **5**, 407 *n.* 2. The question of the 'text' of dreams is further discussed there, ibid., **5**, 458–61.]

3 [In the later part of 'On Beginning the Treatment', p. 137 f. below.]

4 [Cf. Section VII of 'Remarks on the Theory and Practice of Dream Interpretation' (1923*c*), *RSE*, **19**.]

material of the daily associations [*Tageseinfälle*]. When this happens, it looks as though the patient has been amiable enough to bring us in dream form exactly what we had been 'suggesting' to him immediately before. The more experienced analyst will no doubt have some difficulty in attributing any such amiability to the patient; he accepts such dreams as hoped-for confirmations, and recognizes that they are only observed under certain conditions brought about by the influence of the treatment. The great majority of dreams forge ahead of the analysis; so that, after subtraction of everything in them which is already known and understood, there still remains a more or less clear hint at something which has hitherto been hidden.

The present translation is a revised and corrected reprint of Strachey's version.

Though Freud included this paper (published in January, 1912) in the series on technique, it is, in fact, more in the nature of a theoretical examination of the phenomenon of transference and of the way in which it operates in analytic treatment. Freud had already approached the question in some short remarks at the end of the case history of 'Dora' (1905*e* [1901]), *RSE*, **7**, 102–4. He dealt with it much more fully in the last half of Lecture XXVII and the first half of Lecture XXVIII of his *Introductory Lectures* (1916–17*a*), ibid., **16**; and, near the end of his life, made a number of important comments on the subject in the course of his long paper 'Analysis Terminable and Interminable' (1937*c*), ibid., **23**.

THE DYNAMICS OF TRANSFERENCE

The almost inexhaustible topic of transference [*Übertragung*][T] has [99]
recently been dealt with by Wilhelm Stekel [1911*d*] in this journal[1] on descriptive lines. I should like in the following pages to add a few remarks to explain how it is that transference is necessarily brought about during a psychoanalytic treatment, and how it comes to play its familiar part in it.

It must be understood that each individual, through the combined operation of his innate disposition and the influences brought to bear on him during his early years, has acquired a specific method of his own in his conduct of his erotic life – that is, in the preconditions to falling in love which he lays down, in the drives [*Triebe*][T] he satisfies and the aims he sets himself in the course of it.[2] This produces what might be described as a stereotype plate (or several such), which is constantly [100]
repeated – constantly reprinted afresh – in the course of the person's life, so far as external circumstances and the nature of the love objects accessible to him permit, and which is certainly not entirely insusceptible to change in the face of recent experiences. Now, our observations

1 [The *Zentralblatt für Psychoanalyse*, in which the present paper first appeared.]

2 I take this opportunity of defending myself against the mistaken charge of having denied the importance of innate (constitutional) factors because I have stressed that of infantile impressions. A charge such as this arises from the restricted nature of what men look for in the field of causation: in contrast to what ordinarily holds good in the real world, people prefer to be satisfied with a single causative factor. Psychoanalysis has talked a lot about the accidental factors in aetiology and little about the constitutional ones; but that is only because it was able to contribute something fresh to the former, while, to begin with, it knew no more than was commonly known about the latter. We refuse to posit any contrast in principle between the two sets of aetiological factors; on the contrary, we assume that the two sets regularly act jointly in bringing about the observed result. *Δαίμων καὶ Τύχη* [Endowment and Chance] determine a man's fate [*Schicksal*][T] – rarely or never one of these powers [*Mächte*][T] alone. The amount of aetiological effectiveness to be attributed to each of them can only be arrived at in every individual case separately. These cases may be arranged in a series according to the varying proportion in which the two factors are present, and this series will no doubt have its extreme cases. We shall estimate the share taken by constitution or experience differently in individual cases according to the stage reached by our knowledge; and we shall retain the right to modify our judgement along with changes in our understanding. Incidentally, one might venture to regard constitution itself as a precipitate from the accidental effects produced on the endlessly long chain of our ancestors.

have shown that only a portion of these impulses [*Regungen*]^{T} which determine the course of erotic life have passed through the full process of psychical development. That portion is directed towards reality, is at the disposal of the conscious personality, and forms a part of it. Another portion of the libidinal impulses has been held up in the course of development; it has been kept away from the conscious personality and from reality, and either has been prevented from further expansion except in phantasy or has remained wholly in the unconscious so that it is unknown to the personality's consciousness. If someone's need for love is not entirely satisfied by reality, he is bound to approach every new person whom he meets with libidinal anticipatory ideas; and it is highly probable that both portions of his libido, the portion that is capable of becoming conscious as well as the unconscious one, have a share in forming that attitude.

Thus it is a perfectly normal and intelligible thing that the libidinal
Besetzung cathexis [*Libidobesetzung*]^{T} of someone who is partly unsatisfied, a cathexis which is held ready in anticipation, should be directed as well to the figure of the doctor. It follows from our earlier hypothesis that this cathexis will have recourse to prototypes, will attach itself to one of the stereotype plates which are present in the subject; or, to put the position in another way, the cathexis will introduce the doctor into one of the psychical 'series' which the patient has already formed. If the 'father imago', to use the apt term introduced by Jung (1911–12, 164), is the decisive factor in bringing this about, the outcome will tally with the real relations of the subject to his doctor. But the transference is not tied to this particular prototype: it may also come about on the lines of the mother imago or brother imago. The peculiarities of the transference to the doctor, thanks to which it exceeds, both in amount and nature, anything that could be justified on sensible or rational grounds, are made intelligible if we bear in mind that this transference has precisely been set up not only by the *conscious* anticipatory ideas but also by those that have been held back or are unconscious.

[101] There would be nothing more to discuss or worry about in this behaviour of transference if it were not that two points remain unexplained about it which are of particular interest to psychoanalysis. Firstly, we do not understand why transference is so much more intense with neurotic subjects in analysis than it is with other such people who are not being analysed; and secondly, it remains a puzzle why in analysis transference emerges as *the most powerful resistance* to the treatment, whereas outside analysis it must be regarded as the vehicle of cure and

the condition of success. For our experience has shown us – and the fact can be confirmed as often as we please – that if a patient's free associations [*freien Assoziationen*][T] fail[I] the stoppage can invariably be removed by an assurance that he is being dominated at the moment by an association [*Einfalles*] which is concerned with the doctor himself or with something connected with him. As soon as this explanation is given, the stoppage is removed, or the situation is changed from one in which the associations [*Einfälle*] fail into one in which they are being kept back. At first sight it appears to be an immense disadvantage in psychoanalysis as a method that what is elsewhere the strongest factor towards success is changed in it into the most powerful medium of resistance. If, however, we examine the situation more closely, we can at least clear away the first of our two problems. It is not a fact that transference emerges with greater intensity and lack of restraint during psychoanalysis than outside it. In institutions in which nerve patients are treated non-analytically, we can observe transference occurring with the greatest intensity and in the most unworthy forms, extending to nothing less than mental bondage, and moreover showing the plainest erotic colouring. Gabriele Reuter, with her sharp powers of observation, described this at a time when there was no such thing as psychoanalysis, in a remarkable book which betrays in every respect the clearest insight into the nature and genesis of neuroses.[2] These characteristics of transference are therefore to be attributed not to psychoanalysis but to neurosis itself.

Our second problem – the problem of why transference appears in psychoanalysis as resistance – has been left for the moment untouched; and we must now approach it more closely. Let us picture the psychological situation during the treatment. An invariable and indispensable precondition of *every* onset of a psychoneurosis is the process to which Jung has given the appropriate name of 'introversion'.[3] That is to say: the portion of libido which is capable of becoming conscious and is directed towards reality is diminished, and the portion which is directed *away* from reality and is unconscious, and which, though it may still [102]

1 I mean when they really cease, and not when, for instance, the patient keeps them back owing to ordinary feelings of unpleasure [*Unlustgefühles*][T]. *Unlust*

2 *Aus guter Familie*, Berlin, 1895.

3 Even though some of Jung's remarks give the impression that he regards this introversion as something which is characteristic of dementia praecox and does not come into account in the same way in other neuroses. – [This seems to be the first published occasion of Freud's use of 'introversion'. The term was first introduced in Jung, 1910*c*, 38; but Freud is probably criticizing Jung, 1911–12, 135–6 *n*. (English translation, 1916, 487). Some further comment on Jung's use of the term can be found in a footnote to a later technical paper (1913*c*, p. 123 *n*. below) as well as in Freud's paper on narcissism (1914*c*), *RSE*, **14**, 64, and in Lecture XXIII of the *Introductory Lectures* (1916–17*a*), ibid., **16**, 330. Freud used the term extremely seldom in his later writings.]

feed the subject's phantasies, nevertheless belongs to the unconscious, is proportionately increased. The libido (whether wholly or in part) has entered on a regressive course and has revived the subject's infantile imagos.[1] The analytic treatment now proceeds to follow it; it seeks to track down the libido, to make it accessible to consciousness and, in the end, serviceable for reality. Where the investigations of analysis come upon the libido withdrawn into its hiding place, a struggle is bound to break out; all the forces [*Kräfte*][T] which have caused the libido to regress will rise up as 'resistances' against the work of analysis, in order to conserve the new state of things. For if the libido's introversion or regression
[103] had not been justified by a particular relation between the subject and the external world – stated in the most general terms, by the frustration [*Versagung*][T] of satisfaction[2] – and if it had not for the moment even become expedient, it could never have taken place at all. But the resistances from this source are not the only ones or indeed the most powerful. The libido at the disposal of the subject's personality had always been under the influence of the attraction of his unconscious complexes (or, more correctly, of the portions of those complexes belonging to the unconscious),[3] and it entered on a regressive course because the attraction of reality had diminished. In order to liberate it, this attraction of the unconscious has to be overcome; that is, the repression [*Verdrängung*][T] of the unconscious drives and of their productions, which has meanwhile been set up in the subject, must be removed. This is responsible for by far the largest part of the resistance, which so often causes the illness to persist even after the turning away from reality has lost its temporary justification. The analysis has to struggle against the resistances from both these sources. The resistance accompanies the treatment step by step. Every single association, every act of the person under treatment must reckon with the resistance and

1 It would be convenient if we could say 'it has recathected his infantile complexes'. But this would be incorrect: the only justifiable way of putting it would be 'the unconscious portions of those complexes'. – The topics dealt with in this paper are so extraordinarily involved that it is tempting to embark on a number of contiguous problems whose clarification would in point of fact be necessary before it would be possible to speak in unambiguous terms of the psychical processes that are to be described here. These problems include the drawing of a line of distinction between introversion and regression, the fitting of the theory of complexes into the libido theory, the relations of phantasying to the conscious and the unconscious as well as to reality – and others besides. I need not apologize for having resisted this temptation in the present paper. [On the term 'imago' (here and on p. 94 above), cf. an Editors' footnote to the paper on masochism (1924*c*), *RSE*, **19**, 159 *n*. 3.]

2 [See the full discussion of this in the paper on 'Types of Onset of Neurosis' (1912*c*), p. 227 ff. below.]

3 [Cf. the beginning of footnote 1 above.]

represents a compromise between the forces that are striving towards recovery and the opposing ones which I have described.

If now we follow a pathogenic complex from its representation in the conscious (whether this is an obvious one in the form of a symptom or something quite inconspicuous) to its root in the unconscious, we shall soon enter a region in which the resistance makes itself felt so clearly that the next association must take account of it and appear as a compromise between its demands and those of the work of investigation. It is at this point, on the evidence of our experience, that transference enters on the scene. When anything in the complexive material (in the subject matter of the complex) is suitable for being transferred on to the figure of the doctor, that transference is carried out; it produces the next association, and announces itself by indications of a resistance – by a stoppage, for instance. We infer from this experience that the transference idea has penetrated into consciousness in front of any other possible associations *because* it satisfies the resistance. An event of this sort is [104] repeated on countless occasions in the course of an analysis. Over and over again, when we come near to a pathogenic complex, the portion of that complex which is capable of transference is first pushed forward into consciousness and defended with the greatest obstinacy.[1]

After it has been overcome, the overcoming of the other portions of the complex raises few further difficulties. The longer an analytic treatment lasts and the more clearly the patient realizes that distortions of the pathogenic material cannot by themselves offer any protection against its being uncovered, the more consistently does he make use of the one sort of distortion which obviously affords him the greatest advantages – distortion through transference. These circumstances tend towards a situation in which finally every conflict has to be fought out in the sphere of transference.

Thus transference in the analytic treatment invariably appears to us in the first instance as the strongest weapon of the resistance, and we may conclude that the intensity and persistence of the transference are an effect and an expression of the resistance. The *mechanism* of transference is, it is true, dealt with when we have traced it back to the state of readiness of the libido, which has remained in possession of infantile

1 This, however, should not lead us to conclude in general that the element selected for transference resistance is of peculiar pathogenic importance. If in the course of a battle there is a particularly embittered struggle over the possession of some little church or some individual farm, there is no need to suppose that the church is a national shrine, perhaps, or that the house shelters the army's pay-chest. The value of the object may be a purely tactical one and may perhaps emerge only in this one battle. – [On transference resistance see also p. 134 below.]

imagos; but the part transference plays in the treatment can only be explained if we enter into its relations with resistance.

How does it come about that transference is so admirably suited to be a means of resistance? It might be thought that the answer can be given without difficulty. For it is evident that it becomes particularly hard to admit to any proscribed wishful impulse if it has to be revealed in front of the very person to whom the impulse relates. Such a necessity gives rise to situations which in the real world seem scarcely possible. But it is precisely this that the patient is aiming at when he makes the object of his emotional impulses coincide with the doctor. Further consideration, however, shows that this apparent gain cannot provide the solution to [105] the problem. Indeed, a relation of affectionate and devoted dependence can, on the contrary, help a person over all the difficulties of making an admission. In analogous real situations people will usually say: 'I feel no shame in front of you: I can say anything to you.' Thus the transference to the doctor might just as easily serve to *facilitate* admissions, and it is not clear why it should make things more difficult.

The answer to the question which has been repeated so often in these pages is not to be reached by further reflection but by what we discover when we examine individual transference resistances occurring during treatment. We find in the end that we cannot understand the employment of transference as resistance so long as we think simply of 'transference'. We must make up our minds to distinguish a 'positive' transference from a 'negative' one, the transference of affectionate feelings from that of hostile ones, and to treat the two sorts of transference to the doctor separately. Positive transference is then further divisible into transference of friendly or affectionate feelings which are admissible to consciousness and transference of prolongations of those feelings into the unconscious. As regards the latter, analysis shows that they invariably go back to erotic sources. And we are thus led to the discovery that all the emotional relations of sympathy, friendship, trust, and the like, which can be turned to good account in our lives, are genetically linked with sexuality and have developed from purely sexual desires through a softening of their sexual aim, however pure and unsensual they may appear to our conscious self-perception. Originally we knew only sexual objects; and psychoanalysis shows us that people who in our real life are merely admired or respected may still be sexual objects for our unconscious.

Thus the solution to the puzzle is that transference to the doctor is suitable for resistance to the treatment only insofar as it is a negative

transference or a positive transference of repressed erotic impulses. If we 'remove' the transference by making it conscious, we are detaching only these two components of the emotional act from the person of the doctor; the other component, which is admissible to consciousness and unobjectionable, persists and is the vehicle of success in psychoanalysis exactly as it is in other methods of treatment. To this extent we readily [106] admit that the results of psychoanalysis rest upon suggestion; by suggestion, however, we must understand, as Ferenczi (1909) does, the influencing of a person by means of the transference phenomena which are possible in his case. We take care of the patient's final independence by employing suggestion in order to get him to accomplish a piece of psychical work which has as its necessary result a permanent improvement in his psychical situation.

The further question may be raised of why it is that the resistance phenomena of transference appear only in psychoanalysis and not in indifferent forms of treatment (e.g. in institutions) as well. The reply is that they do show themselves in these other situations too, but they have to be recognized as such. The breaking out of a negative transference is actually quite a common event in institutions. As soon as a patient comes under the dominance of the negative transference he leaves the institution in an unchanged or relapsed condition. The erotic transference does not have such an inhibiting effect in institutions, since in them, just as in ordinary life, it is glossed over instead of being uncovered. But it is manifested quite clearly as a resistance to recovery, not, it is true, by driving the patient out of the institution – on the contrary, it holds him back in it – but by keeping him at a distance from life. For, from the point of view of recovery, it is a matter of complete indifference whether the patient overcomes this or that anxiety [*Angst*]^{T} or inhibition [*Hemmung*]^{T} in the institution; what matters is that he shall be free of it in his real life as well.

The negative transference deserves a detailed examination, which it cannot be given within the limits of the present paper. In the curable forms of psychoneurosis it is found side by side with the affectionate transference, often directed simultaneously towards the same person. Bleuler has coined the excellent term 'ambivalence' to describe this phenomenon.[1] Up to a point, ambivalence of feeling of this sort seems to

1 Bleuler, 1911, 43–4 and 305–6. – Cf. a lecture on ambivalence delivered by him in Bern in 1910, reported in the *Zentralblatt für Psychoanalyse*, **1**, 266. – Stekel has proposed the term 'bipolarity' for the same phenomenon. – [This appears to have been Freud's first mention of the word 'ambivalence'. He occasionally used it in a sense other than Bleuler's, to describe the simultaneous presence of active and passive impulses. See an Editors' footnote, *RSE*, **14**, 115 *n.* 2.]

be normal; but a high degree of it is certainly a special peculiarity of
[107] neurotic people. In obsessional neurotics an early separation of the 'pairs of opposites'[1] seems to be characteristic of their drive activity and to be one of their constitutional preconditions. Ambivalence in the emotional trends of neurotics is the best explanation of their ability to enlist their transferences in the service of resistance. Where the capacity for transference has become essentially limited to a negative one, as is the case with paranoics, there ceases to be any possibility of influence or cure.

In all these reflections, however, we have hitherto dealt with only one side of the phenomenon of transference; we must turn our attention to another aspect of the same subject. Anyone who forms a correct appreciation of the way in which a person in analysis, as soon as he comes under the dominance of any considerable transference resistance, is flung out of his real relation to the doctor, how he feels at liberty then to disregard the fundamental rule of psychoanalysis[2] which lays it down that whatever comes into one's head must be reported without criticizing it, how he forgets the intentions with which he started the treatment, and how he regards with indifference logical arguments and conclusions which only a short time before had made a great impression on him – anyone who has observed all this will feel it necessary to look for an explanation of his impression in other factors besides those that have already been adduced. Nor are such factors far to seek: they arise once again from the psychological situation in which the treatment places the patient.

In the process of seeking out the libido which has escaped from the patient's conscious, we have penetrated into the realm of the uncon-
[108] scious. The reactions which we bring about reveal at the same time some of the characteristics which we have come to know from the study of dreams. The unconscious impulses do not want to be remembered in the way the treatment desires them to be, but endeavour to reproduce

1 [The pairs of opposite drives were first described by Freud in his *Three Essays* (1905*d*), *RSE*, **7**, 142 and 148–9, and later on in 'Drives and their Vicissitudes' (1915*c*), ibid., **14**, 111 ff. Their importance in obsessional neurosis was discussed in the 'Rat Man' case history (1909*d*), ibid., **10**, 179 ff.]

2 [This seems to be the first use of what was henceforward to become the regular description of the essential technical rule. A very similar phrase ('the main rule of psychoanalysis') had, however, been used already in the third of Freud's Clark University Lectures (1910*a*), ibid., **11**, 32. The idea itself, of course, goes back a long way; it is expressed, for instance, in Chapter II of *The Interpretation of Dreams* (1900*a*), ibid., **4**, 90, in essentially the same terms as in the paper 'On Beginning the Treatment' (1913*c*), p. 131 below, where, incidentally, the subject can be found discussed in a long footnote (p. 132 *n.*). Cf. also 'Freud's Psychoanalytic Procedure' (1904*a*), *RSE*, **7**, 224 f.]

themselves in accordance with the timelessness of the unconscious and its capacity for hallucination.[1] Just as happens in dreams, the patient regards the products of the awakening of his unconscious impulses as contemporaneous and real; he seeks to put his passions into action without taking any account of the real situation. The doctor tries to compel him to fit these emotional impulses into the nexus of the treatment and of his life history, to submit them to intellectual consideration and to understand them in the light of their psychical value. This struggle between the doctor and the patient, between intellect and drive, between understanding and seeking to act, is played out almost exclusively in the phenomena of transference. It is on that field that the victory must be won – the victory whose expression is the permanent cure of the neurosis. It cannot be disputed that controlling the phenomena of transference presents the psychoanalyst with the greatest difficulties. But it should not be forgotten that it is precisely they that do us the inestimable service of making the patient's hidden and forgotten erotic impulses immediate and manifest. For when all is said and done, it is impossible to destroy anyone *in absentia* or *in effigie*.[2]

1 [This is elaborated in a later technical paper 'Remembering, Repeating and Working Through' (1914g), p. 148 ff. below.]

2 [Cf. the similar remark in the middle of p. 150 below.]

The present translation is a revised and corrected reprint of the *SE* version.

This paper first appeared in June, 1912.

It deals with the question of what mental stance the analyst should adopt during an analysis – a topic to which, as Ernest Jones informs us (1955), Freud was stimulated by Ferenczi. This is the first appearance of the term 'evenly suspended attention' (p. 107 below), which is 'the necessary counterpart to the demand made on the patient that he should communicate everything that occurs to him without criticism or selection' (p. 108). The importance of the analyst's own analysis is stressed again. Freud advises against revealing too much to the patient about oneself, and warns the analyst not to be over-ambitious therapeutically.

RECOMMENDATIONS TO PHYSICIANS PRACTISING PSYCHOANALYSIS

The technical rules which I am putting forward here have been arrived at [111]
from my own experience in the course of many years, after unfortunate results had led me to abandon other methods. It will easily be seen that they (or at least many of them) may be summed up in a single precept. [Cf. p. 111 below.] My hope is that observance of them will spare physicians practising analysis much unnecessary effort and guard them against some oversights. I must, however, make it clear that what I am asserting is that this technique is the only one suited to my individuality; I do not venture to deny that a physician quite differently constituted might find himself driven to adopt a different attitude to his patients and to the task before him.

(*a*) The first problem confronting an analyst who is treating more than one patient in the day will seem to him the hardest. It is the task of keeping in mind all the innumerable names, dates, detailed memories, associations [*Einfälle*][T] and pathological products which each patient communicates in the course of months and years of treatment, and of not confusing them with similar material produced by other patients under treatment simultaneously or previously. If one is required to analyse six, eight, or even more patients daily, the feat of memory involved in achieving this will provoke incredulity, astonishment or even commiseration in uninformed observers. Curiosity will in any case be felt about the technique which makes it possible to master such an abundance of material, and the expectation will be that some special expedients are required for the purpose.

The technique, however, is a very simple one. As we shall see, it rejects the use of any special expedient (even that of taking notes). It consists simply in not directing one's notice to anything in particular and in maintaining the same 'evenly suspended attention' (as I have called it)[1]

1 [The reference seems to be to a sentence in the case history of 'Little Hans' (1909*b*), *RSE*, **10**, 18, though the wording there is slightly different. The present phrase occurs again later, in 'Two Encyclopaedia Articles' (1923*a*), ibid., **18**, 233.]

[112] in the face of all that one hears. In this way we spare ourselves a strain on our attention which could not in any case be kept up for several hours daily, and we avoid a danger which is inseparable from the exercise of deliberate attention. For as soon as anyone deliberately concentrates his attention to a certain degree, he begins to select from the material before him; one point will be fixed in his mind with particular clearness and some other will be correspondingly disregarded, and in making this selection he will be following his expectations or inclinations. This, however, is precisely what must not be done. In making the selection, if he follows his expectations he is in danger of never finding anything but what he already knows; and if he follows his inclinations he will certainly falsify what he may perceive. It must not be forgotten that the things one hears are for the most part things whose meaning is

Nachträglichkeit recognized only later on [*nachträglich*][T].

It will be seen that the rule of giving equal notice to everything is the necessary counterpart to the demand made on the patient that he should communicate everything that occurs to him without criticism or selection. If the doctor behaves otherwise, he is throwing away most of the advantage which results from the patient's obeying the 'fundamental rule of psychoanalysis'.[1] The rule for the doctor may be expressed: 'He should withhold all conscious influences from his capacity to attend, and give himself over completely to his "unconscious memory".' Or, to put it purely in terms of technique: 'He should simply listen, and not bother about whether he is keeping anything in mind.'

What is achieved in this manner will be sufficient for all requirements during the treatment. Those elements of the material which already form a connected context will be at the doctor's conscious disposal; the rest, as yet unconnected and in chaotic disorder, seems at first to be submerged, but rises readily into recollection as soon as the patient brings up something new to which it can be related and by which it can be continued. The undeserved compliment of having 'a remarkably good memory' which the patient pays one when one reproduces some detail

[113] after a year and a day can then be accepted with a smile, whereas a conscious determination to recollect the point would probably have resulted in failure.

Mistakes in this process of remembering occur only at times and places at which one is disturbed by some personal consideration (see below [p. 111 f.]) – that is, when one has fallen seriously below the standard of an ideal analyst. Confusion with material brought up by other patients

1 [See footnote 2, p. 100 above.]

occurs very rarely. Where there is a dispute with the patient as to whether or how he has said some particular thing, the doctor is usually in the right.[1]

(*b*) I cannot advise the taking of full notes, the keeping of a shorthand record, etc., during analytic sessions. Apart from the unfavourable impression which this makes on some patients, the same considerations as have been advanced with regard to attention apply here too.[2] A detrimental selection from the material will necessarily be made as one writes the notes or shorthand, and part of one's own mental activity [*Geistestätigkeit*][T] is tied up in this way, which would be better employed in *Geist*
interpreting [*Deutung*][T] what one has heard. No objection can be raised to making exceptions to this rule in the case of dates, the text of dreams, or particular noteworthy events which can easily be detached from their context and are suitable for independent use as instances.[3] But I am not in the habit of doing this either. As regards instances, I write them down from memory in the evening after work is over; as regards texts of dreams to which I attach importance, I get the patient to repeat them to me after he has related them so that I can fix them in my mind.

(*c*) Taking notes during the session with the patient might be justified by [114]
an intention of publishing a scientific study of the case. On general grounds this can scarcely be denied. Nevertheless, it must be borne in mind that exact reports of analytic case histories are of less value than might be expected. Strictly speaking, they possess only the *ostensible* exactness of which 'modern' psychiatry affords us some striking examples. They are, as a rule, fatiguing to the reader and yet do not succeed in being a substitute for his actual presence at an analysis. Experience invariably shows that if readers are willing to believe an analyst they will have confidence in any slight revision to which he has submitted his material; if, on the other hand, they are unwilling to take analysis and the analyst seriously, they will pay no attention to accurate

1 A patient will often assert that he has already told the doctor something on a previous occasion, while the doctor can assure him with a quiet feeling of superiority that it has come up now for the first time. It then turns out that the patient had previously had the intention of saying it, but had been prevented from performing his intention by a resistance which was still present. His recollection of his intention is indistinguishable to him from a recollection of its performance. [Freud enlarged on this point not long afterwards in a short paper on 'Fausse Reconnaissance' occurring during analysis (1914*a*), *RSE*, **13**, 195 f.]

2 [A footnote to the same effect had been inserted by Freud in his 'Rat Man' case history (1909*d*), ibid., **10**, 123 *n.* 1.]

3 [Presumably for scientific purposes.]

verbatim records of the treatment either. This is not the way, it seems, to remedy the lack of convincing evidence to be found in psychoanalytic reports.

(*d*) One of the claims of psychoanalysis to distinction is, no doubt, that in its execution research and treatment coincide; nevertheless, after a certain point, the technique required for the one opposes that required for the other. It is not a good thing to work on a case scientifically while treatment is still proceeding – to piece together its structure, to try to foretell its further progress, and to get a picture from time to time of the current state of affairs, as scientific interest would demand. Cases which are devoted from the first to scientific purposes and are treated accordingly suffer in their outcome; while the most successful cases are those in which one proceeds, as it were, without any purpose in view, allows oneself to be taken by surprise by any new turn in them, and always meets them with an open mind, free from any presuppositions. The correct behaviour for an analyst lies in swinging over according to need from the one mental attitude to the other, in avoiding speculation or brooding over cases while they are in analysis, and in submitting the material obtained to a synthetic process of thought only after the analysis is concluded. The distinction between the two attitudes would be meaningless if we already possessed all the knowledge (or at least the essential knowledge) about the psychology of the unconscious and about the structure of the neuroses that we can obtain from psychoanalytic work.
[115] At present we are still far from that goal and we ought not to cut ourselves off from the possibility of testing what we have already learnt and of extending our knowledge further.

(*e*) I cannot advise my colleagues too urgently to model themselves during psychoanalytic treatment on the surgeon, who puts aside all his feelings, even his human sympathy, and concentrates his mental forces
Kraft [*geistigen Kräften*]^{T} on the single aim of performing the operation as skilfully as possible. Under present-day conditions the feeling that is most dangerous to a psychoanalyst is the therapeutic ambition to achieve by this novel and much disputed method something that will produce a convincing effect upon other people. This will not only put him into a state of mind which is unfavourable for his work, but will make him helpless against certain resistances of the patient, whose recovery, as we know, primarily depends on the interplay of forces in him. The justification for requiring this emotional coldness in the analyst is that it

creates the most advantageous conditions for both parties: for the doctor a desirable protection for his own emotional life and for the patient the largest amount of help that we can give him today. A surgeon of earlier times took as his motto the words: 'Je le pansai, Dieu le guérit.'[1] The analyst should be content with something similar.

(*f*) It is easy to see upon what aim the different rules I have brought forward converge. [See p. 107 above.] They are all intended to create for the doctor a counterpart to the 'fundamental rule of psychoanalysis' which is laid down for the patient. Just as the patient must relate everything that his self-observation can detect, and keep back all the logical and affective objections that seek to induce him to make a selection from among them, so the doctor must put himself in a position to make use of everything he is told for the purposes of interpretation and of recognizing the concealed unconscious material without substituting a censorship of his own for the selection that the patient has forgone. To put it in a formula: he must turn his own unconscious like a receptive organ towards the transmitting unconscious of the patient. He must adjust himself to the patient as a telephone receiver is adjusted to the transmitting microphone. Just as the receiver converts back into sound [116] waves the electric oscillations in the telephone line which were set up by sound waves, so the doctor's unconscious is able, from the derivatives of the unconscious which are communicated to him, to reconstruct that unconscious, which has determined the patient's free associations [*Einfälle*].

But if the doctor is to be in a position to use his unconscious in this way as an instrument in the analysis, he must himself fulfil one psychological condition to a high degree. He may not tolerate any resistances in himself which hold back from his consciousness what has been perceived by his unconscious; otherwise he would introduce into the analysis a new species of selection and distortion which would be far more detrimental than that resulting from concentration of conscious attention. It is not enough for this that he himself should be an approximately normal person. It may be insisted, rather, that he should have undergone a psychoanalytic purification and have become aware of those complexes of his own which would be apt to interfere with his grasp of what the patient tells him. There can be no reasonable doubt about the disqualifying effect of such defects in the doctor; every

1 ['I dressed his wounds, God cured him.' The saying is attributed to the French surgeon Ambroise Paré (c. 1517–90).]

unresolved repression [*Verdrängung*][T] in him constitutes what has been aptly described by Stekel[1] as a 'blind spot' in his analytic perception.

Some years ago I gave as an answer to the question of how one can become an analyst: 'By analysing one's own dreams'.[2] This preparation is no doubt enough for many people, but not for everyone who wishes to learn analysis. Nor can everyone succeed in interpreting his own dreams without outside help. I count it as one of the many merits of the Zürich school of analysis that they have laid increased emphasis on this requirement, and have embodied it in the demand that everyone who wishes to carry out analyses on other people shall first himself undergo an analysis by someone with expert knowledge. Anyone who takes up the work seriously should choose this course, which offers more than one advantage; the sacrifice involved in laying oneself open to another person
[117] without being driven to it by illness is amply rewarded. Not only is one's aim of learning to know what is hidden in one's own mind far more rapidly attained and with less expense of affect, but impressions and convictions will be gained in relation to oneself which will be sought in vain from studying books and attending lectures. And lastly, we must not underestimate the advantage to be derived from the lasting mental contact that is as a rule established between the student and his guide.[3]

An analysis such as this of someone who is practically healthy will, as may be imagined, remain incomplete. Anyone who can appreciate the high value of the self-knowledge and increase in self-control thus acquired will, when it is over, continue the analytic examination of his personality in the form of a self-analysis, and be content to realize that, within himself as well as in the external world, he must always expect to find something new. But anyone who has scorned to take the precaution of being analysed himself will not merely be punished by being incapable of learning more than a certain amount from his patients, he will risk a more serious danger and one which may become a danger to others. He will easily fall into the temptation of projecting outwards some of the peculiarities of his own personality, which he has dimly perceived, into the field of science, as a theory having universal validity; he will bring

1 [Stekel, 1911*a*, 532.]

2 [The reference is to the third of Freud's Clark University lectures (1910*a* [1909]), *RSE*, **11**, 33. Some account of his varying views on the subject can be found in an Editors' footnote to the 'History of the Psychoanalytic Movement' (1914*d*), ibid., **14**, 17 *n.* 1.]

3 [See, however, a less optimistic view expressed in Section II of 'Analysis Terminable and Interminable' (1937*c*), ibid., **23**, 198 ff. That paper, one of the very last of Freud's writings, touches at many other points (especially in Section VII) on the subject discussed in this and the next paragraph.]

the psychoanalytic method into discredit, and lead the inexperienced astray.

(*g*) I shall now add a few other rules, that will serve as a transition from the attitude of the doctor to the treatment of the patient.

Young and eager psychoanalysts will no doubt be tempted to bring their own individuality freely into the discussion, in order to carry the patient along with them and lift him over the barriers of his own narrow personality. It might be expected that it would be quite allowable and indeed useful, with a view to overcoming the patient's existing resistances, for the doctor to afford him a glimpse of his own mental defects and conflicts and, by giving him intimate information about his own life, enable him to put himself on an equal footing. One confidence [118] deserves another, and anyone who demands intimacy from someone else must be prepared to give it in return.

But in psychoanalytic relations things often happen differently from what the psychology of consciousness might lead us to expect. Experience does not speak in favour of an affective technique of this kind. Nor is it hard to see that it involves a departure from psychoanalytic principles and verges upon treatment by suggestion. It may induce the patient to bring forward sooner and with less difficulty things he already knows but would otherwise have kept back for a time through conventional resistances. But this technique achieves nothing towards the uncovering of what is unconscious to the patient. It makes him even more incapable of overcoming his deeper resistances, and in severer cases it invariably fails by encouraging the patient to be insatiable: he would like to reverse the situation, and finds the analysis of the doctor more interesting than his own. The resolution of the transference, too – one of the main tasks of the treatment – is made more difficult by an intimate attitude on the doctor's part, so that any gain there may be at the beginning is more than outweighed at the end. I have no hesitation, therefore, in condemning this kind of technique as incorrect. The doctor should be opaque to his patients and, like a mirror, should show them nothing but what is shown to him. In practice, it is true, there is nothing to be said against a psychotherapist combining a certain amount of analysis with some suggestive influence in order to achieve a perceptible result in a shorter time – as is necessary, for instance, in institutions. But one has a right to insist that he himself should be in no doubt about what he is doing and should know that his method is not that of true psychoanalysis.

(*h*) Another temptation arises out of the educative activity which, in psychoanalytic treatment, devolves on the doctor without any deliberate intention on his part. When the developmental inhibitions [*Entwicklungshemmungen*][T] are resolved, it happens of itself that the doctor finds himself in a position to indicate new aims for the trends that have been liberated. It is then no more than a natural ambition if he endeavours to make something specially excellent of a person whom he has been at such pains to free from his neurosis and if he prescribes high aims for his wishes. But here again the doctor should hold himself in check, and take the patient's capacities rather than his own desires as guide. Not every neurotic has a high talent for sublimation; one can assume of many of them that they would not have fallen ill at all if they had possessed the art of sublimating their drives [*Triebe*][T]. If we press them unduly towards sublimation and cut them off from the most accessible and convenient drive satisfactions, we shall usually make life even harder for them than they feel it in any case. As a doctor, one must above all be tolerant to the weakness of a patient, and must be content if one has won back some degree of capacity for work and enjoyment [*Leistungs- und Genussfähigkeit*][t] for a person even of only moderate worth. Educative ambition is of as little use as therapeutic ambition. It must further be borne in mind that many people fall ill precisely from an attempt to sublimate their drives beyond the degree permitted by their organization and that in those who have a capacity for sublimation the process usually takes place of itself as soon as their inhibitions have been overcome by analysis. In my opinion, therefore, efforts invariably to make use of the analytic treatment to bring about sublimation of drive are, though no doubt always laudable, far from being in every case advisable.

Hemmung

[119]

(*i*) To what extent should the patient's intellectual cooperation be sought in the treatment? It is difficult to say anything of general applicability on this point: the patient's personality is the determining factor. But in any case caution and self-restraint must be observed in this connection. It is wrong to set a patient tasks, such as collecting his memories or thinking over some particular period of his life. On the contrary, he has to learn above all – what never comes easily to anyone – that mental activities such as thinking something over or concentrating the attention solve none of the riddles of a neurosis; that can only be done by patiently obeying the psychoanalytic rule, which enjoins the exclusion of all criticism of the unconscious or of its derivatives. One must be especially unyielding about obedience to that rule with patients who practise the

art of sheering off into intellectual discussion during their treatment, who speculate a great deal and often very wisely about their condition and in that way avoid doing anything to overcome it. For this reason I dislike making use of analytic writings as an assistance to my patients; [120] I require them to learn by personal experience, and I assure them that they will acquire wider and more valuable knowledge than the whole literature of psychoanalysis could teach them. I recognize, however, that under institutional conditions it may be of great advantage to employ reading as a preparation for patients in analysis and as a means of creating an atmosphere of influence.

I must give a most earnest warning against any attempt to gain the confidence or support of parents or relatives by giving them psychoanalytic books to read, whether of an introductory or an advanced kind. This well-meant step usually has the effect of bringing on prematurely the natural opposition of the relatives to the treatment – an opposition which is bound to appear sooner or later – so that the treatment is never even begun.

Let me express a hope that the increasing experience of psychoanalysts will soon lead to agreement on questions of technique and on the most effective method of treating neurotic patients. As regards the treatment of their relatives I must confess myself utterly at a loss, and I have in general little faith in any individual treatment of them.

ON BEGINNING THE TREATMENT

(FURTHER RECOMMENDATIONS ON THE TECHNIQUE OF PSYCHOANALYSIS I) (1913)

1958 *SE*, **12**, 123–44. (Tr. James Strachey, modified version of the 1924 translation.)
'On Initiating Treatment'
2002 *PMC*, *Wild Analysis*, 43–64. (Tr. Alan Bance.)

The present translation is a revised and corrected reprint of the *SE* version.

This paper was published in two instalments, in January and March, 1913. The first instalment, ending with the words 'with what material is the treatment to begin?' (on p. 131 below), bore the title 'Weitere Ratschläge zur Technik der Psychoanalyse: I. Zur Einleitung der Behandlung'. The second instalment bore the same title, but with the additional words: '– Die Frage der ersten Mitteilungen – Die Dynamik der Heilung'. This full title is the one rendered in the first English translation as given above. All the German editions from 1924 onwards adopted the short title 'Zur Einleitung der Behandlung', without any additions. In the author's original view (as is shown by his manuscript) the paper fell into three sections, corresponding to the title. The first of these, 'On Beginning the Treatment', ends on p. 135, the second, 'The Question of the First Communications', on p. 137, where the third, 'The Dynamics of the Cure', begins.

ON BEGINNING THE TREATMENT[1]

(FURTHER RECOMMENDATIONS ON THE TECHNIQUE OF PSYCHOANALYSIS I)

Anyone who hopes to learn the noble game of chess from books will [123]
soon discover that only the openings and end-games admit of an exhaustive systematic presentation and that the infinite variety of moves which develop after the opening defy any such description. This gap in instruction can only be filled by a diligent study of games fought out by masters. The rules which can be laid down for the practice of psychoanalytic treatment are subject to similar limitations.

In what follows I shall endeavour to collect together for the use of practising analysts some of the rules for the beginning of the treatment. Among them there are some which may seem to be petty details, as, indeed, they are. Their justification is that they are simply rules of the game which acquire their importance from their relation to the general plan of the game. I think I am well advised, however, to call these rules 'recommendations' and not to claim any unconditional acceptance for them. The extraordinary diversity of the psychical [*psychischen*] constellations concerned, the plasticity of all mental [*seelischen*][T] processes and *Seele*
the wealth of determining factors oppose any mechanization of the technique; and they bring it about that a course of action that is as a rule justified may at times prove ineffective, while one that is usually mistaken may once in a while lead to the desired end. These circumstances, however, do not prevent us from laying down a procedure for the physician which is effective on the average.

Some years ago I set out the most important indications for selecting patients[2] and I shall therefore not repeat them here. They have in the

1 [In the first edition only, the following footnote appeared at this point: 'Continuation of a series of papers which were published in the *Zentralblatt für Psychoanalyse*, **2** (3, 4 and 9). ("The Handling of Dream Interpretation in Psychoanalysis", "The Dynamics of Transference", and "Recommendations to Physicians Practising Psychoanalysis".)']

2 'On Psychotherapy' (1905*a*) [*RSE*, **7**, 267 ff.].

meantime been approved by other psychoanalysts. But I may add that
[124] since then I have made it my habit, when I know little about a patient, only to take him on at first provisionally, for a period of one to two weeks. If one breaks off within this period one spares the patient the distressing impression of an attempted cure having failed. One has only been undertaking a 'sounding' in order to get to know the case and to decide whether it is a suitable one for psychoanalysis. No other kind of preliminary examination but this procedure is at our disposal; the most lengthy discussions and questionings in ordinary consultations would offer no substitute. This preliminary experiment, however, is itself the beginning of a psychoanalysis and must conform to its rules. There may perhaps be this distinction made, that in it one lets the patient do nearly all the talking and explains nothing more than what is absolutely necessary to get him to go on with what he is saying.

There are also diagnostic reasons for beginning the treatment with a trial period of this sort lasting for one or two weeks. Often enough, when one sees a neurosis with hysterical or obsessional symptoms
Zwang [*Zwangssymptomen*][T], which is not excessively marked and has not been in existence for long – just the type of case, that is, that one would regard as suitable for treatment – one has to reckon with the possibility that it may be a preliminary stage of what is known as dementia praecox ('schizophrenia', in Bleuler's terminology; 'paraphrenia', as I have proposed to call it[1]), and that sooner or later it will show a well-marked picture of that affection. I do not agree that it is always possible to make the distinction so easily. I am aware that there are psychiatrists who hesitate less often in their differential diagnosis, but I have become convinced that just as often they make mistakes. To make a mistake, moreover, is of far greater moment for the psychoanalyst than it is for the clinical psychiatrist, as he is called. For the latter is not attempting to do anything that will be of use, whichever kind of case it may be. He merely runs the risk of making a theoretical mistake, and his diagnosis is of no more than academic interest. Where the psychoanalyst is concerned, however, if the case is unfavourable he has committed a practical error; he has been responsible for wasted expenditure and has discredited his method of treatment. He cannot fulfil his promise of cure if the patient is suffering, not from hysteria or obsessional neurosis, but from
[125] paraphrenia, and he therefore has particularly strong motives for avoiding mistakes in diagnosis. In an experimental treatment of a few weeks he will often observe suspicious signs which may determine him

1 [See above, footnote 1, p. 66.]

not to pursue the attempt any further. Unfortunately, I cannot assert that an attempt of this kind always enables us to arrive at a certain decision; it is only one wise precaution the more.[1]

Lengthy preliminary discussions before the beginning of the analytic treatment, previous treatment by another method and also previous acquaintance between the doctor and the patient who is to be analysed have special disadvantageous consequences for which one must be prepared. They result in the patient's meeting the doctor with a transference attitude [*Übertragungseinstellung*][T] which is already established and which the doctor must first slowly uncover instead of having the opportunity to observe the growth and development of the transference from the outset. In this way the patient gains a temporary start upon us which we do not willingly grant him in the treatment. *Übertragung*

One must mistrust all prospective patients who want to make a delay before beginning their treatment. Experience shows that when the time agreed upon has arrived they fail to put in an appearance, even though the motive for the delay – i.e. their rationalization of their intention – seems to the uninitiated to be above suspicion.

Special difficulties arise when the analyst and his new patient or their families are on terms of friendship or have social ties with one another. The psychoanalyst who is asked to undertake the treatment of the wife or child of a friend must be prepared for it to cost him that friendship, no matter what the outcome of the treatment may be: nevertheless, he must make the sacrifice if he cannot find a trustworthy substitute.

Both lay public and doctors – still ready to confuse psychoanalysis with treatment by suggestion – are inclined to attribute great importance to the expectations which the patient brings to the new treatment. They often believe in the case of one patient that he will not give much trouble, because he has great confidence in psychoanalysis and is fully convinced of its truth and efficacy; whereas in the case of another, they think that he will undoubtedly prove more difficult, because he has a sceptical outlook and will not believe anything until he has experienced its successful results on his own person. Actually, however, this attitude on the part of [126]

1 There is a great deal to be said about this uncertainty in diagnosis, about the prospects of success in analysing mild forms of paraphrenia and about the reasons for the similarity between the two disorders; but I cannot enlarge on these subjects in the present context. I should be glad to follow Jung in contrasting hysteria and obsessional neurosis as 'transference neuroses' with the paraphrenic affections as 'introversion neuroses', if it were not that such a usage would deprive the concept of 'introversion' (of the libido) of its sole legitimate meaning. [Cf. footnote 3, p. 95 above. Freud's subsequent nosology is set out in *RSE*, **19**, 141 ff. and 179 ff. (1924*b* and 1924*e*).]

the patient has very little importance. His initial trust or distrust is almost negligible compared with the internal resistances which hold the neurosis firmly in place. It is true that the patient's happy trustfulness makes our earliest relationship with him a very pleasant one; we are grateful to him for that, but we warn him that his favourable prepossession will be shattered by the first difficulty that arises in the analysis. To the sceptic we say that the analysis requires no faith, that he may be as critical and suspicious as he pleases and that we do not regard his attitude as the effect of his judgement at all, for he is not in a position to form a reliable judgement on these matters; his distrust is only a symptom like his other symptoms and it will not be an interference, provided he conscientiously carries out what the rule of the treatment requires of him.

No-one who is familiar with the nature of neurosis will be astonished to hear that even a man who is very well able to carry out an analysis on other people can behave like any other mortal and be capable of producing the most intense resistances as soon as he himself becomes the object of analytic investigation. When this happens we are once again reminded of the dimension of depth in the mind, and it does not surprise us to find that the neurosis has its roots in psychical strata to which an intellectual knowledge of analysis has not penetrated.

Points of importance at the beginning of the analysis are arrangements about *time* and *money*.

In regard to time, I adhere strictly to the principle of leasing a definite hour. Each patient is allotted a particular hour of my available working day; it belongs to him and he is liable for it, even if he does not make use of it. This arrangement, which is taken as a matter of course for teachers of music or languages in good society, may perhaps seem too rigorous in a doctor, or even unworthy of his profession.
[127] There will be an inclination to point to the many accidents which may prevent the patient from attending every day at the same hour and it will be expected that some allowance shall be made for the numerous intercurrent ailments which may occur in the course of a longish analytic treatment. But my answer is: no other way is practicable. Under a less stringent regime the 'occasional' non-attendances increase so greatly that the doctor finds his material existence threatened; whereas when the arrangement is adhered to, it turns out that accidental hindrances do not occur at all and intercurrent illnesses only very seldom. The analyst is hardly ever put in the position of enjoying a leisure hour

which he is paid for and would be ashamed of; and he can continue his work without interruptions, and is spared the distressing and bewildering experience of finding that a break for which he cannot blame himself is always bound to happen just when the work promises to be especially important and rich in content. Nothing brings home to one so strongly the significance of the psychogenic factor in the daily life of men, the frequency of malingering and the non-existence of chance as a few years' practice of psychoanalysis on the strict principle of leasing by the hour. In cases of undoubted organic illnesses, which, after all, cannot be excluded by the patient's having a psychical interest in attending, I break off the treatment, consider myself entitled to dispose elsewhere of the hour which becomes free, and take the patient back again as soon as he has recovered and I have another hour vacant.

I work with my patients every day except on Sundays and public holidays – that is, as a rule, six days a week. For slight cases or the continuation of a treatment which is already well advanced, three days a week will be enough. Any restrictions of time beyond this bring no advantage either to the doctor or the patient; and at the beginning of an analysis they are quite out of the question. Even short interruptions have a slightly obscuring effect on the work. We used to speak jokingly of the 'Monday crust' when we began work again after the rest on Sunday. When the hours of work are less frequent, there is a risk of not being able to keep pace with the patient's real life and of the treatment losing contact with the present and being forced into bypaths. Occasionally, too, one comes across patients to whom one must give more than the average time of one hour a day, because the best part of an hour is gone before they begin to open up and to become communicative at all. [128]

An unwelcome question which the patient asks the doctor at the outset is: 'How long will the treatment take? How much time will you need to relieve me of my trouble?' If one has proposed a trial treatment of a few weeks one can avoid giving a direct answer to this question by promising to make a more reliable pronouncement at the end of the trial period. Our answer is like the answer given by the Philosopher to the Wayfarer in Aesop's fable. When the Wayfarer asked how long a journey lay ahead, the Philosopher merely answered 'Walk!' and afterwards explained his apparently unhelpful reply on the ground that he must know the length of the Wayfarer's stride before he could tell how long his journey would take.[1] This expedient helps one over the first difficulties; but the

1 [This sentence has been slightly expanded in translation for the sake of clarity.]

comparison is not a good one, for the neurotic can easily alter his pace and may at times make only very slow progress. In point of fact, the question as to the probable duration of a treatment is almost unanswerable.

As the combined result of lack of insight on the part of patients and disingenuousness on the part of doctors, analysis finds itself expected to fulfil the most boundless demands, and that in the shortest time. Let me, as an example, give some details from a letter which I received a few days ago from a lady in Russia. She is 53[1] years old, her illness began twenty-three years ago and for the last ten years she has no longer been able to do any continuous work. 'Treatment in a number of institutions for nervous cases' has not succeeded in making an 'active life' possible for her. She hopes to be completely cured by psychoanalysis, which she has read about, but her illness has already cost her family so much money that she cannot manage to come to Vienna for longer than six weeks or two months. Another added difficulty is that she wishes from the very start to 'explain' herself in writing only, since any discussion of her complexes would cause an explosion of feeling in her or 'render her temporarily unable to speak'. – No-one would expect a man to lift a heavy table with two fingers as if it were a light stool, or to
[129] build a large house in the time it would take to put up a wooden hut; but as soon as it becomes a question of the neuroses – which do not seem so far to have found a proper place in human thought – even intelligent people forget that a necessary proportion must be observed between time, work and success. This, incidentally, is an understandable result of the deep ignorance which prevails about the aetiology of the neuroses. Thanks to this ignorance, neurosis is looked on as a kind of 'maiden from afar'.[2] 'None knew whence she came'; so they expected that one day she would vanish.

Doctors lend support to these fond hopes. Even the informed among them often fail to estimate properly the severity of nervous disorders. A friend and colleague of mine, to whose great credit I account it that after several decades of scientific work on other principles he became converted to the merits of psychoanalysis, once wrote to me: 'What we need is a short, convenient, out-patient treatment for obsessional neurosis.' I could not supply him with it and felt ashamed; so I tried to excuse myself with the remark that specialists in internal diseases, too,

1 [In the editions before 1925 this read '33'.]

2 [An allusion to Schiller's poem 'Das Mädchen aus der Fremde'.]

would probably be very glad of a treatment for tuberculosis or carcinoma which combined these advantages.

To speak more plainly, psychoanalysis is always a matter of long periods of time, of half a year or whole years – of longer periods than the patient expects. It is therefore our duty to tell the patient this before he finally decides upon the treatment. I consider it altogether more honourable, and also more expedient, to draw his attention – without trying to frighten him off, but at the very beginning – to the difficulties and sacrifices which analytic treatment involves, and in this way to deprive him of any right to say later on that he has been inveigled into a treatment whose extent and implications he did not realize. A patient who lets himself be dissuaded by this information would in any case have shown himself unsuitable later on. It is a good thing to institute a selection of this kind before the beginning of the treatment. With the progress of understanding among patients the number of those who successfully meet this first test increases.

I do not bind patients to continue the treatment for a certain length of time; I allow each one to break off whenever he likes. But I do not hide it from him that if the treatment is stopped after only a small amount of work has been done it will not be successful and may easily, like an unfinished operation, leave him in an unsatisfactory state. In the early years of my psychoanalytic practice I used to have the greatest difficulty in prevailing on my patients to continue their analysis. This difficulty has long since been shifted, and I now have to take the greatest pains to induce them to give it up. [130]

To shorten analytic treatment is a justifiable wish, and its fulfilment, as we shall learn, is being attempted along various lines. Unfortunately, it is opposed by a very important factor, namely, the slowness with which deep-going changes in the mind are accomplished – in the last resort, no doubt, the 'timelessness' of our unconscious processes.[1] When patients are faced with the difficulty of the great expenditure of time required for analysis they not infrequently manage to propose a way out of it. They divide up their ailments and describe some as unbearable, and others as secondary, and then say: 'If only you will relieve me of this one (for instance, a headache or a particular fear) I can deal with the other one on my own in my ordinary life.' In doing this, however, they overestimate the selective power of analysis. The analyst is certainly able to do a great deal, but he cannot determine beforehand exactly what results he will effect. He sets in motion a

1 [Cf. 'The Unconscious' (1915*e*), *RSE*, **14**, 165 and *n*. 3.]

process, that of the resolving of existing repressions. He can supervise this process, further it, remove obstacles in its way, and he can undoubtedly vitiate much of it. But on the whole, once begun, it goes its own way and does not allow either the direction it takes or the order in which it picks up its points to be prescribed for it. The analyst's power over the symptoms of the disease may thus be compared to male sexual potency. A man can, it is true, beget a whole child, but even the strongest man cannot create in the female organism a head alone or an arm or a leg; he cannot even prescribe the child's sex. He, too, only sets in motion a highly complicated process, determined by events in the remote past, which ends with the detachment of the child from its mother. A neurosis as well has the character of an organism. Its component manifestations are not independent of one another; they condition one another and give one another mutual support. A person suffers from one neurosis only, never from several which have accidentally met together in a single individual. The
[131] patient freed, according to his wish, from his one unendurable symptom might easily find that a symptom which had previously been negligible had now increased and grown unendurable. The analyst who wishes the treatment to owe its success as little as possible to its elements of suggestion (i.e. to the transference) will do well to refrain from making use of even the trace of selective influence upon the results of the therapy which may perhaps be open to him. The patients who are bound to be most welcome to him are those who ask him to give them complete health, insofar as that is attainable, and who place as much time at his disposal as is necessary for the process of recovery. Such favourable conditions as these are, of course, to be looked for in only a few cases.

The next point that must be decided at the beginning of the treatment is the one of money, of the doctor's fee. An analyst does not dispute that money is to be regarded in the first instance as a medium for self-preservation and for obtaining power; but he maintains that, besides this, powerful sexual factors are involved in the value set upon it. He can point out that money matters are treated by civilized people in the same way as sexual matters – with the same inconsistency, prudishness and hypocrisy. The analyst is therefore determined from the first not to fall in with this attitude, but, in his dealings with his patients, to treat of money matters with the same matter-of-course frankness with which he wishes to educate them in things relating to sexual life. He

shows them that he himself has cast off false shame on these topics, by voluntarily telling them the price at which he values his time. Ordinary good sense cautions him, furthermore, not to allow large sums of money to accumulate, but to ask for payment at fairly short regular intervals – monthly, perhaps. (It is a familiar fact that the value of the treatment is not enhanced in the patient's eyes if a very low fee is asked.) This is, of course, not the usual practice of nerve specialists or other physicians in our European society. But the psychoanalyst may put himself in the position of a surgeon, who is frank and expensive because he has at his disposal methods of treatment which can be of use. It seems to me more respectable and ethically less objectionable to acknowledge one's actual claims and needs rather than, as is still the practice among physicians, to act the part of the disinterested philanthropist – a position which one is not, in fact, able to fill, with the result that one is secretly [132] aggrieved, or complains aloud, at the lack of consideration and the desire for exploitation evinced by one's patients. In fixing his fee the analyst must also allow for the fact that, hard as he may work, he can never earn as much as other medical specialists.

For the same reason he should also refrain from giving treatment free, and make no exceptions to this in favour of his colleagues or their families. This last recommendation will seem to offend against professional amenities. It must be remembered, however, that a gratuitous treatment means much more to a psychoanalyst than to any other medical man; it means the sacrifice of a considerable portion – an eighth or a seventh part, perhaps – of the working time available to him for earning his living, over a period of many months. A second free treatment carried on at the same time would already deprive him of a quarter or a third of his earning capacity, and this would be comparable to the damage inflicted by a severe accident.

The question then arises whether the advantage gained by the patient would not to some extent counterbalance the sacrifice made by the physician. I may venture to form a judgement about this, since for ten years or so I set aside one hour a day, and sometimes two, for gratuitous treatments, because I wanted, in order to find my way about in the neuroses, to work in the face of as little resistance as possible. The advantages I sought by this means were not forthcoming. Free treatment enormously increases some of a neurotic's resistances – in young women, for instance, the temptation which is inherent in their transference relation, and in young men, their opposition to an obligation to feel grateful, an opposition which arises from their father complex and which

presents one of the most troublesome hindrances to the acceptance of medical help. The absence of the regulating effect offered by the payment of a fee to the doctor makes itself very painfully felt; the whole relationship is removed from the real world, and the patient is deprived of a strong motive for endeavouring to bring the treatment to an end.

One may be very far from the ascetic view of money as a curse and yet regret that analytic therapy is almost inaccessible to poor people, both for external and internal reasons. Little can be done to remedy this. Perhaps there is truth in the widespread belief that those who are forced
[133] by necessity to a life of hard toil are less easily overtaken by neurosis. But on the other hand experience shows without a doubt that when once a poor man has produced a neurosis it is only with difficulty that he lets it be taken from him. It renders him too good a service in the struggle for existence; the secondary gain from illness[1] which it brings him is much too important. He now claims by right of his neurosis the pity which the
Versagung world has refused [*versagt*][T] to his material distress, and he can now absolve himself of the obligation of combating his poverty by working. Anyone therefore who tries to deal with the neurosis of a poor person by psychotherapy usually discovers that what is here required of him is a practical therapy of a very different kind – the kind which, according to our local tradition, used to be dispensed by the Emperor Joseph II.[2] Naturally, one does occasionally come across deserving people who are helpless from no fault of their own, in whom unpaid treatment does not meet with any of the obstacles that I have mentioned and in whom it leads to excellent results.

As far as the middle classes are concerned, the expense involved in psychoanalysis is excessive only in appearance. Quite apart from the fact that no comparison is possible between restored health and efficiency on the one hand and a moderate financial outlay on the other, when we add up the unceasing costs of nursing homes and medical treatment and contrast them with the increase of efficiency and earning capacity which results from a successfully completed analysis, we are entitled to say that the patients have made a good bargain. Nothing in life is so expensive as illness – and stupidity.

Before I wind up these remarks on beginning analytic treatment, I must say a word about a certain ceremonial which concerns the position in

1 [The idea of a 'secondary gain from illness' occurs in Section B of the paper on hysterical attacks (1909*a*), *RSE*, **9**, 203, though the actual phrase seems to be used for the first time here. For a fuller discussion see a footnote added by Freud in 1923 to the 'Dora' case history (1905*e*), ibid., **7**, 39 *n*.]

which the treatment is carried out. I hold to the plan of getting the patient to lie on a sofa while I sit behind him out of his sight. This arrangement has a historical basis; it is the remnant of the hypnotic method out of which psychoanalysis was evolved. But it deserves to be maintained for many reasons. The first is a personal motive, but one [134]
which others may share with me. I cannot put up with being stared at by other people for eight hours a day (or more). Since, while I am listening to the patient, I, too, give myself over to the current [*Ablauf*][T] of my unconscious thoughts, I do not wish my expressions of face to give the patient material for interpretations or to influence him in what he tells me. The patient usually regards being made to adopt this position as a hardship and rebels against it, especially if the drive to look [*Schautrieb*][T] (scopophilia [*Voyeurtum*]) plays an important part in his neurosis. I insist on this procedure, however, for its purpose and result are to prevent the transference from mingling with the patient's associations [*Einfällen*][T] imperceptibly, to isolate the transference and to allow it to come forward in due course sharply defined as a resistance. I know that many analysts work in a different way, but I do not know whether this deviation is due more to a craving for doing things differently or to some advantage which they find they gain by it. [See also below, p. 135.]

The conditions of treatment having been regulated in this manner, the question arises at what point and with what material is the treatment to begin?

What the material is with which one starts the treatment is on the whole a matter of indifference – whether it is the patient's life history or the history of his illness or his recollections of childhood. But in any case the patient must be left to do the talking and must be free to choose at what point he shall begin. We therefore say to him: 'Before I can say anything to you I must know a great deal about you; please tell me what you know about yourself.'

The only exception to this is in regard to the fundamental rule of psychoanalytic technique[1] which the patient has to observe. This must be imparted to him at the very beginning: 'One more thing before you start. What you tell me must differ in one respect from an ordinary conversation. Ordinarily you rightly try to keep a connecting thread running through your remarks and you exclude any intrusive ideas [*störenden Einfälle*] that may occur to you and any side-issues, so as not to wander too far from the point. But in this case you must proceed differently. You

1 [See footnote 2, p. 100 above.]

[135] will notice that as you relate things various thoughts will occur to you which you would like to put aside on the ground of certain criticisms and objections. You will be tempted to say to yourself that this or that is irrelevant here, or is quite unimportant, or nonsensical, so that there is no need to say it. You must never give in to these criticisms, but must say it in spite of them – indeed, you must say it precisely *because* you feel an aversion to doing so. Later on you will find out and learn to understand the reason for this injunction, which is really the only one you have to follow. So say whatever goes through your mind. Act as though, for instance, you were a traveller sitting next to the window of a railway carriage and describing to someone inside the carriage the changing views which you see outside. Finally, never forget that you have promised to be absolutely honest, and never leave anything out because, for some reason or other, it is unpleasant to tell it.'[1]

[136] Patients who date their illness from a particular moment usually concentrate upon its precipitating cause. Others, who themselves recognize the connection between their neurosis and their childhood, often begin with an account of their whole life history. A systematic narrative should never be expected and nothing should be done to encourage it. Every detail of the story will have to be told afresh later on, and it is only

1 Much might be said about our experiences with the fundamental rule of psychoanalysis. One occasionally comes across people who behave as if they had made this rule for themselves. Others offend against it from the very beginning. It is indispensable, and also advantageous, to lay down the rule in the first stages of the treatment. Later, under the dominance of the resistances, obedience to it weakens, and there comes a time in every analysis when the patient disregards it. We must remember from our own self-analysis how irresistible the temptation is to yield to these pretexts put forward by critical judgement for rejecting certain ideas. How small is the effect of such agreements as one makes with the patient in laying down the fundamental rule is regularly demonstrated when something intimate about a third person comes up in his mind for the first time. He knows that he is supposed to say everything, but he turns discretion about other people into a new obstacle. 'Must I really say everything? I thought that only applied to things that concern myself.' It is naturally impossible to carry out analysis if the patient's relations with other people and his thoughts about them are excluded. *Pour faire une omelette il faut casser des oeufs*. An honourable man readily forgets such of the private affairs of strangers as do not seem to him important to know. Nor can an exception be made in the case of names. Otherwise the patient's narratives become a little shadowy, like the scenes in Goethe's play *Die natürliche Tochter* [*The Natural Daughter*], and do not lodge in the doctor's memory. Moreover, the names that are withheld screen the approach to all sorts of important connections. But one may perhaps allow names to be left on one side until the patient has become more familiar with the doctor and the procedure of analysis. It is very remarkable how the whole task becomes impossible if a reservation is allowed at any single place. But we have only to reflect what would happen if the right of asylum existed at any one point in a town; how long would it be before all the riff-raff of the town had collected there? I once treated a high official who was bound by his oath of office not to communicate certain things because they were state secrets, and the analysis came to grief as a consequence of this restriction. Psychoanalytic treatment must have no regard for any consideration, because the neurosis and its resistances are themselves without any such regard.

with these repetitions that additional material will appear which will supply the important connections that are unknown to the patient.

There are patients who from the very first hours carefully prepare what they are going to communicate, ostensibly so as to be sure of making better use of the time devoted to the treatment. What is thus disguising itself as eagerness is resistance. Any preparation of this sort should be disrecommended, for it is only employed to guard against unwelcome thoughts cropping up.[1] However genuinely the patient may believe in his excellent intentions, the resistance will play its part in this deliberate method of preparation and will see to it that the most valuable material escapes communication. One will soon find that the patient devises yet other means by which what is required may be withheld from the treatment. He may talk over the treatment every day with some intimate friend, and bring into this discussion all the thoughts which should come forward in the presence of the doctor. The treatment thus has a leak which lets through precisely what is most valuable. When this happens, the patient must, without much delay, be advised to treat his analysis as a matter between himself and his doctor and to exclude everyone else from sharing in the knowledge of it, no matter how close to him they may be, or how inquisitive. In later stages of the treatment the patient is usually not subjected to temptations of this sort.

Certain patients want their treatment to be kept secret, often because they have kept their neurosis secret; and I put no obstacle in their way. [137]
That in consequence the world hears nothing of some of the most successful cures is, of course, a consideration that cannot be taken into account. It is obvious that a patient's decision in favour of secrecy already reveals a feature of his secret history.

In advising the patient at the beginning of the treatment to tell as few people as possible about it, we also protect him to some extent from the many hostile influences that will seek to entice him away from analysis. Such influences may be very mischievous at the outset of the treatment; later, they are usually immaterial, or even useful in bringing to the fore resistances which are trying to conceal themselves.

If during the course of the analysis the patient should temporarily need some other medical or specialist treatment, it is far wiser to call in a non-analytic colleague than to give this other treatment oneself.[2] Combined treatments for neurotic disorders which have a powerful

1 Exceptions may be made only for such data as family relationships, times and places of residence, operations, and so on.

2 [Compare this with Freud's own experiences in his very earliest cases as described in *Studies on Hysteria* (1895*d*), e.g. *RSE*, **2**, 46 and 122 f.]

organic basis are nearly always impracticable. The patients withdraw their interest from analysis as soon as they are shown more than one path that promises to lead them to health. The best plan is to postpone the organic treatment until the psychical treatment is finished; if the former were tried first it would in most cases meet with no success.

To return to the beginning of the treatment. Patients are occasionally met with who start the treatment by assuring us that they cannot think of anything to say, although the whole field of their life history and the story of their illness is open to them to choose from.[1] Their request that we should tell them what to talk about must not be granted on this first occasion any more than on any later one. We must bear in mind what is involved here. A strong resistance has come to the front in order to defend the neurosis; we must take up the challenge then and there and come to grips with it. Energetic and repeated assurances to the patient that it is impossible for no ideas at all to occur to him at the beginning,
[138] and that what is in question is a resistance against the analysis, soon oblige him to make the expected admissions or to uncover a first piece of his complexes. It is a bad sign if he has to confess that while he was listening to the fundamental rule of analysis he made a mental reservation that he would nevertheless keep this or that to himself; it is not so serious if all he has to tell us is how mistrustful he is of analysis or the horrifying things he has heard about it. If he denies these and similar possibilities when they are put before him, he can be driven by our insistence to acknowledge that he has nevertheless overlooked certain thoughts which were occupying his mind. He had thought of the treatment itself, though nothing definite about it, or he had been occupied with the picture of the room in which he was, or he could not help thinking of the objects in the consulting room and of the fact that he was lying here on a sofa – all of which he has replaced with the word 'nothing'. These indications are intelligible enough: everything connected with the present situation represents a transference to the doctor, which proves suitable to serve as a first resistance.[2] We are thus obliged to begin by uncovering this transference; and a path from it will give rapid access to the patient's pathogenic material. Women who are prepared by events in their past history to be subjected to sexual aggression and men with

1 [This technical problem is already discussed by Freud in the last pages of his contribution to *Studies on Hysteria*, *RSE*, **2**, 268–71.]

2 [Cf. 'The Dynamics of Transference', p. 94 ff. above. – In a footnote to Chapter X of *Group Psychology* (1921c), *RSE*, **18**, 118 *n.*, Freud draws attention to the similarity between this situation and certain hypnotic techniques.]

over-strong repressed homosexuality are the most apt thus to withhold the ideas that occur to them at the outset of their analysis.

The patient's first symptoms or chance actions, like his first resistance, may possess a special interest and may betray a complex which governs his neurosis. A clever young philosopher with exquisite aesthetic sensibilities will hasten to put the creases of his trousers straight before lying down for his first hour; he is revealing himself as a former coprophilic of the highest refinement – which was to be expected from the later aesthete. A young girl will at the same juncture hurriedly pull the hem of her skirt over her exposed ankles; in doing this she is giving away the gist of what her analysis will uncover later: her narcissistic pride in her physical beauty and her inclinations to exhibitionism.

A particularly large number of patients object to being asked to lie [139] down, while the doctor sits out of sight behind them.[1] They ask to be allowed to go through the treatment in some other position, for the most part because they are anxious not to be deprived of a view of the doctor. Permission is regularly refused, but one cannot prevent them from contriving to say a few sentences before the beginning of the actual 'session' or after one has indicated that it is finished and they have got up from the sofa. In this way they divide the treatment in their own view into an official portion, in which they mostly behave in a very inhibited manner, and an informal 'friendly' portion, in which they speak really freely and say all sorts of things which they themselves do not regard as being part of the treatment. The doctor does not accept this division for long. He takes note of what is said before or after the session and he brings it forward at the first opportunity, thus pulling down the partition which the patient has tried to erect. This partition, once again, will have been put together from the material of a transference resistance.

So long as the patient's communications and ideas run on without any obstruction, the theme of transference should be left untouched. One must wait until the transference, which is the most delicate of all procedures, has become a resistance.

The next question with which we are faced raises a matter of principle. It is this: When are we to begin making our communications to the patient? When is the moment for disclosing to him the hidden meaning of the ideas that occur to him, and for initiating him into the postulates and technical procedures of analysis?

The answer to this can only be: Not until an effective transference has

1 [Cf. above, p. 131.]

been established in the patient, a proper rapport with him. It remains the first aim of the treatment to attach him to it and to the person of the doctor. To ensure this, nothing need be done but to give him time. If one exhibits a serious interest in him, carefully clears away the resistances that crop up at the beginning and avoids making certain mistakes, he will of himself form such an attachment and link the doctor up with one of
[140] the imagos of the people by whom he was accustomed to be treated with affection. It is certainly possible to forfeit this first success if from the start one takes up any standpoint other than one of sympathetic understanding [*Einfühlung*][t], such as a moralizing one, or if one behaves like a representative or advocate of some contending party – of the other member of a married couple, for instance.[1]

This answer, of course, involves a condemnation of any line of behaviour which would lead us to give the patient a translation [*Übersetzungen*][T] of his symptoms as soon as we have guessed it ourselves, or would even lead us to regard it as a special triumph to fling these 'solutions' in his face at the first interview. It is not difficult for a skilled analyst to read the patient's secret wishes plainly between the lines of his complaints and the story of his illness; but what a measure of self-complacency and thoughtlessness must be possessed by anyone who can, on the shortest acquaintance, inform a stranger who is entirely ignorant of all the tenets of analysis that he is attached to his mother by incestuous ties, that he harbours wishes for the death of his wife whom he appears to love, that he conceals an intention of betraying his superior, and so on![2] I have heard that there are analysts who plume themselves upon these kinds of lightning diagnoses and 'express' treatments, but I must warn everyone against following such examples. Behaviour of this sort will completely discredit oneself and the treatment in the patient's eyes and will arouse the most violent opposition in him, whether or not one's guess has been true; indeed, the truer the guess the more violent will be the resistance. As a rule the therapeutic effect will be nil; but the deterring of the patient from analysis will be final. Even in the later stages of analysis one must be careful not to give a patient the solution to a symptom or the translation of a wish until he is already so close to it that he has only one short step more to make in order to get hold of the explanation for himself. In former years I often had occasion to find that the premature communication of a solution brought

1 [In the first edition only, the latter part of this sentence read: '. . . if one behaves like a representative or advocate of some contending party with whom the patient is engaged in a conflict – of his parents, for instance, or the other member of a married couple.']

2 [Cf. the detailed example of this which Freud had already given in his paper on '"Wild" Psychoanalysis' (1910*k*), *RSE*, **11**, 213 ff.]

the treatment to an untimely end, on account not only of the resistances [141]
which it thus suddenly awakened but also of the relief which the solution brought with it.

But at this point an objection will be raised. Is it, then, our task to lengthen the treatment and not, rather, to bring it to an end as rapidly as possible? Are not the patient's ailments due to his lack of knowledge and understanding and is it not a duty to enlighten him as soon as possible – that is, as soon as the doctor himself knows the explanations? The answer to this question calls for a short digression on the meaning of knowledge and the mechanism of cure in analysis.

It is true that in the earliest days of analytic technique we took an intellectualist view of the situation. We set a high value on the patient's knowledge of what he had forgotten, and in this we made hardly any distinction between our knowledge of it and his. We thought it a special piece of good luck if we were able to obtain information about the forgotten childhood trauma from other sources – for instance, from parents or nurses or the seducer himself – as in some cases it was possible to do; and we hastened to convey the information and the proofs of its correctness to the patient, in the certain expectation of thus bringing the neurosis and the treatment to a rapid end. It was a severe disappointment when the expected success was not forthcoming. How could it be that the patient, who now knew about his traumatic experience, nevertheless still behaved as if he knew no more about it than before? Indeed, telling and describing his repressed trauma to him did not even result in any recollection of it coming into his mind.

In one particular case the mother of a hysterical girl had confided to me the homosexual experience which had greatly contributed to the fixation of the girl's attacks. The mother had herself surprised the scene; but the patient had completely forgotten it, though it had occurred when she was already approaching puberty. I was now able to make a most instructive observation. Every time I repeated her mother's story to the girl she reacted with a hysterical attack, and after this she forgot the story once more. There is no doubt that the patient was expressing a violent resistance against the knowledge that was being forced upon her. Finally, she simulated feeble-mindedness and a complete loss of memory in order to protect herself against what I had told her. After this, there was no [142]
choice but to cease attributing to the fact of knowing, in itself, the importance that had previously been given to it and to place the emphasis on the resistances which had in the past brought about the state of not knowing

and which were still ready to defend that state. Conscious knowledge, even if it was not subsequently driven out again, was powerless against those resistances.[1]

The strange behaviour of patients, in being able to combine a conscious knowing with not knowing, remains inexplicable by what is called normal psychology. But to psychoanalysis, which recognizes the existence of the unconscious, it presents no difficulty. The phenomenon we have described, moreover, provides some of the best support for a view *Seele* which approaches mental [*seelischen*]^{T} processes from the angle of topographical differentiation. The patients now know of the repressed *Verdrängung* [*verdrängten*]^{T} experience in their conscious thought, but this thought lacks any connection with the place where the repressed recollection is in some way or other contained. No change is possible until the conscious thought process has penetrated to that place and has overcome the resistances of repression there. It is just as though a decree were promulgated by the Ministry of Justice to the effect that juvenile delinquencies should be dealt with in a certain lenient manner. As long as this decree has not come to the knowledge of the local magistrates, or in the event of their not intending to obey it but preferring to administer justice by their own lights, no change can occur in the treatment of particular youthful delinquents. For the sake of complete accuracy, however, it should be added that the communication of repressed material to the patient's consciousness is nevertheless not without effect. It does not produce the hoped-for result of putting an end to the symptoms; but it has other consequences. At first it arouses resistances, but then, when these have been overcome, it sets up a process of thought in the course of which the expected influencing of the unconscious recollection eventually takes place.[2]

[143] It is now time for us to take a survey of the play of forces which is set in motion by the treatment. The primary motive force [*Motor*] in the therapy is the patient's suffering and the wish to be cured that arises from it. The strength of this driving force [*Triebkraft*]^{T} is subtracted from by various factors – which are not discovered till the analysis is in

1 [The very different views on this subject held by Freud during the Breuer period are clearly shown in the account he gives of a similar case in *Studies on Hysteria* (1895*d*), *RSE*, **2**, 244–5.]

2 [The topographical picture of the distinction between unconscious and conscious ideas had been discussed by Freud already in the case history of 'Little Hans' (1909*b*), ibid., **10**, 92–3, and he had referred to it again by implication in his paper on 'wild' analysis (1910*k*), ibid., **11**, 216 f. The difficulties and insufficiencies of the picture were pointed out some two years after the publication of the present work in Sections II and VII of the metapsychological paper on 'The Unconscious' (1915*e*), ibid., **14**, where a more deep-going account of the distinction was propounded.]

progress – above all, by what we have called the 'secondary gain from illness';[1] but it must be maintained till the end of the treatment. Every improvement effects a diminution of this driving force. By itself, however, it is not sufficient to get rid of the illness. Two things are lacking in it for this: it does not know what paths to follow to reach this end; and it does not possess the necessary quota of energy with which to oppose the resistances. The analytic treatment helps to remedy both these deficiencies. It supplies the amounts of energy that are needed for overcoming the resistances by making mobile the energies which lie ready for the transference; and, by giving the patient information at the right time, it shows him the paths along which he should direct those energies. Often enough the transference is able to remove the symptoms of the disease by itself, but only for a while – only for as long as it itself lasts. In this case the treatment is a treatment by suggestion, and not a psychoanalysis at all. It deserves the latter name only if the intensity of the transference has been utilized for the overcoming of resistances. Only then has being ill become impossible, even when the transference has once more been dissolved, which is its destined end.

In the course of the treatment yet another helpful factor is aroused. This is the patient's intellectual interest and understanding. But this alone hardly comes into consideration in comparison with the other forces that are engaged in the struggle; for it is always in danger of losing its value, as a result of the clouding of judgement that arises from the resistances. Thus the new sources of strength for which the patient is indebted to his analyst are reducible to transference and instruction (through the communications made to him). The patient, however, [144]
makes use of the instruction only insofar as he is induced to do so by the transference; and it is for this reason that our first communication should be withheld until a strong transference has been established. And this, we may add, holds good of every subsequent communication. In each case we must wait until the disturbance of the transference by the successive emergence of transference resistances has been removed.[2]

1 [See footnote 1, p. 130 above.]

2 [The whole question of the mechanism of psychoanalytic therapy and, in particular, of the transference was discussed at greater length in Lectures XXVII and XXVIII of the *Introductory Lectures* (1916–17*a*), *RSE*, **16**, 381 ff. and 396 ff. – Freud makes some interesting comments on the difficulty of carrying out the 'fundamental rule of psychoanalysis' (p. 131 ff. above) in Chapter VI of *Inhibitions, Symptoms and Anxiety* (1926*d*), *RSE*, **20**, 108.]

REMEMBERING, REPEATING AND WORKING THROUGH

The present translation is a revised and corrected reprint of the *SE* version.

At its original appearance (which was at the end of 1914) the title of this paper ran: 'Weitere Ratschläge zur Technik der Psychoanalyse (II): Erinnern, Wiederholen und Durcharbeiten'. The title of the English translation of 1924, quoted above, is a rendering of this. From 1924 onwards the German editions adopted the shorter title.

This paper is noteworthy, apart from its technical interest, for containing the first appearance of the concepts of the 'compulsion to repeat' (p. 148 below) and of 'working through' (p. 152).

REMEMBERING, REPEATING AND WORKING THROUGH

(FURTHER RECOMMENDATIONS ON THE TECHNIQUE OF PSYCHOANALYSIS II)

[147] It seems to me not unnecessary to keep on reminding students of the far-reaching changes which psychoanalytic technique has undergone since its first beginnings. In its first phase – that of Breuer's catharsis – it consisted in bringing directly into focus the moment at which the symptom was formed, and in persistently endeavouring to reproduce the mental processes involved in that situation, in order to direct their discharge [*Ablauf*][T] along the path of conscious activity. Remembering and abreacting, with the help of the hypnotic state, were what was at that time aimed at. Next, when hypnosis had been given up, the task became one of discovering from the patient's free associations [*freien Einfällen*][T] what he failed [*versagte*][T] to remember. The resistance was to be circumvented by the work of interpretation [*Deutungsarbeit*][T] and by making its results known to the patient. The situations which had given rise to the formation of the symptom and the other situations which lay behind the moment at which the illness broke out retained their place as the focus of interest; but the element of abreaction receded into the background and seemed to be replaced by the expenditure of work which the patient had to make in being obliged to overcome his criticism of his free associations, in accordance with the fundamental rule of psychoanalysis. Finally, there was evolved the consistent technique used today, in which the analyst gives up the attempt to bring a particular moment or problem into focus. He contents himself with studying whatever is present for the time being on the surface of the patient's mind, and he employs the art of interpretation mainly for the purpose of recognizing the resistances which appear there, and making them conscious to the patient. From this there results a new sort of division of labour: the doctor uncovers the resistances which are unknown to the patient; when these have been got the better of, the

Versagung

Deutung

patient often relates the forgotten situations and connections without any difficulty. The aim of these different techniques has, of course, [148] remained the same. Descriptively speaking, it is to fill in gaps in memory; dynamically speaking, it is to overcome resistances due to repression *Verdrängung* [*Verdrängungswiderstände*][T].

We must still be grateful to the old hypnotic technique for having brought before us single psychical processes of analysis in an isolated or schematic form. Only this could have given us the courage ourselves to create more complicated situations in the analytic treatment and to keep them clear before us.

In these hypnotic treatments the process of remembering took a very simple form. The patient put himself back into an earlier situation, which he seemed never to confuse with the present one, and gave an account of the mental processes belonging to it, insofar as they had remained normal; he then added to this whatever was able to emerge as a result of transforming the processes that had at the time been unconscious into conscious ones.

At this point I will interpolate a few remarks which every analyst has found confirmed in his observations.[1] Forgetting impressions, scenes or experiences nearly always reduces itself to shutting them off. When the patient talks about these 'forgotten' things he seldom fails to add: 'As a matter of fact I've always known it; only I've never thought of it.' He often expresses disappointment at the fact that not enough things come into his head that he can call 'forgotten' – that he has never thought of since they happened. Nevertheless, even this desire is fulfilled, especially in the case of conversion hysterias. 'Forgetting' becomes still further restricted when we assess at their true value the screen memories which are so generally present. In some cases I have had an impression that the familiar childhood amnesia, which is theoretically so important to us, is completely counterbalanced by screen memories [*Deckerinnerungen*][T]. Not only *some* but *all* of what is essential from childhood has been retained in these memories. It is simply a question of knowing how to extract it out of them by analysis. They represent the forgotten years of childhood as adequately as the manifest content of a dream represents the dream thoughts.

The other group of psychical processes – phantasies, processes of reference [*Beziehungsvorgänge*][t], emotional impulses [*Gefühls-* *Regung* [149] *regungen*][T], thought connections – which, as purely internal acts, can

1 [In the first edition only, this and the following three paragraphs (which make up the 'interpolation') were printed in smaller type.]

be contrasted with impressions and experiences, must, in their relation to forgetting and remembering, be considered separately. In these processes it particularly often happens that something is 'remembered' which could never have been 'forgotten' because it was never at any time noticed – was never conscious. As regards the course taken by psychical events it seems to make no difference whatever whether such a 'thought connection' was conscious and then forgotten or whether it never managed to become conscious at all. The conviction which the patient obtains in the course of his analysis is quite independent of this kind of memory.

In the many different forms of obsessional neurosis [*Zwangsneurose*][T] in particular, forgetting is mostly restricted to dissolving thought connections, failing to draw the right conclusions and isolating memories.

There is one special class of experiences of the utmost importance for which no memory can as a rule be recovered. These are experiences which occurred in very early childhood and were not understood at the time but which were *subsequently* [*nachträglich*][T] understood and interpreted. One gains a knowledge of them through dreams and one is obliged to believe in them on the most compelling evidence [*zwingendsten Motive*][T] provided by the fabric of the neurosis. Moreover, we can ascertain for ourselves that the patient, after his resistances have been overcome, no longer invokes the absence of any memory of them (any sense of familiarity with them) as a ground for refusing to accept them. This matter, however, calls for so much critical caution and introduces so much that is novel and startling that I shall reserve it for a separate discussion in connection with suitable material.[1]

Nachträglichkeit

Motiv

Under the new technique very little, and often nothing, is left of this delightfully smooth course of events.[2] There are some cases which behave like those under the hypnotic technique up to a point and only later cease to do so; but others behave differently from the beginning. If we confine ourselves to this second type in order to bring out the difference, we may say that the patient does not *remember* anything of what he has

[150]

1 [This is a reference to the 'Wolf Man' and his dream at the age of four. Freud had only recently completed his analysis, and he was probably engaged in writing the case history more or less simultaneously with the present paper, though it was only published some four years later (1918*b*), *RSE*, **17**, 26. Before that time, however, Freud entered into a discussion of this special class of childhood memories in the later part of Lecture XXIII of his *Introductory Lectures* (1916–17*a*), ibid., **16**, 323 f.]

2 [Freud picks up his argument from where he left it at the beginning of the 'interpolation' on the previous page.]

forgotten and repressed, but *acts* it out [*agiere*][T]. He reproduces it not as a memory but as an action; he *repeats* it, without, of course, knowing that he is repeating it.[1]

For instance, the patient does not say that he remembers that he used to be defiant and critical towards his parents' authority; instead, he behaves in that way to the doctor. He does not remember how he came to a helpless and hopeless deadlock in his infantile sexual researches; but he produces a mass of confused dreams and associations [*Einfälle*], complains that he cannot succeed in anything and asserts that he is fated never to carry through what he undertakes. He does not remember having been intensely ashamed of certain sexual activities and afraid of their being found out; but he makes it clear that he is ashamed of the treatment on which he is now embarked and tries to keep it secret from everybody. And so on.

Above all, the patient will *begin* his treatment with a repetition of this kind. When one has announced the fundamental rule of psychoanalysis to a patient with an eventful life history and a long story of illness and has then asked him to say what occurs to his mind, one expects him to pour out a flood of information; but often the first thing that happens is that he has nothing to say. He is silent and declares that nothing occurs to him. This, of course, is merely a repetition of a homosexual attitude which comes to the fore as a resistance against remembering anything [p. 134 f. above]. As long as the patient is in the treatment he cannot escape from this compulsion to repeat [*Zwange zur Wiederholung*];[2] and in the end we understand that this is his way of remembering.

[151] What interests us most of all is naturally the relation of this compulsion to repeat to the transference and to resistance. We soon perceive that the transference is itself only a piece of repetition, and that the repetition is a transference of the forgotten past not only on to the doctor but also on to all the other aspects of the current situation. We must be prepared to find, therefore, that the patient yields to the compulsion to repeat, which now replaces the impulsion to remember, not only in his personal attitude to his doctor but also in every other activity and relationship which may occupy his life at the time – if, for instance, he

1 [This had been made plain by Freud very much earlier, in his Postscript to his analysis of 'Dora' (1905*e*), *RSE*, **7**, 105, where the topic of transference is under discussion.]

2 [This seems to be the first appearance of the idea, which, in a much more generalized form, was to play such an important part in Freud's later theory of the drives. In its present clinical application, it reappears in the paper on 'The "Uncanny"' (1919*h*), ibid., **17**, 232, and is used as part of the evidence in support of the general thesis in Chapter III of *Beyond the Pleasure Principle* (1920*g*), ibid., **18**, 18 ff., where there is a reference back to the present paper.]

falls in love or undertakes a task or starts an enterprise during the treatment. The part played by resistance, too, is easily recognized. The greater the resistance, the more extensively will acting out [*Agieren*] (repetition) replace remembering. For the ideal remembering of what has been forgotten which occurs in hypnosis corresponds to a state in which resistance has been put completely on one side. If the patient starts his treatment under the auspices of a mild and unpronounced positive transference it makes it possible at first for him to unearth his memories just as he would under hypnosis, and during this time his pathological symptoms themselves are quiescent. But if, as the analysis proceeds, the transference becomes hostile or unduly intense and therefore in need of repression, remembering at once gives way to acting out. From then onwards the resistances determine the sequence of the material which is to be repeated. The patient brings out of the armoury of the past the weapons with which he defends himself against the progress of the treatment – weapons which we must wrest from him one by one.

We have learnt that the patient repeats instead of remembering, and repeats under the conditions of resistance. We may now ask what it is that he, in fact, repeats or acts out. The answer is that he repeats everything that has already made its way from the sources of the repressed into his manifest personality – his inhibitions [*Hemmungen*]^{T} and unserviceable attitudes and his pathological character traits. He also repeats all his symptoms in the course of the treatment. And now we can see that in drawing attention to the compulsion to repeat we have acquired no new fact but only a more comprehensive view [*Auffassung*]^{T}. We have only made it clear to ourselves that the patient's state of being ill cannot cease with the beginning of his analysis, and that we must treat his illness, not as an event of the past, but as a present-day force [*Macht*]^{T}. This state of illness is brought, piece by piece, within the field and range of operation of the treatment, and while the patient experiences it as something real and contemporary, we have to do our therapeutic work on it, which consists in a large measure in tracing it back to the past. [152]

Remembering, as it was induced in hypnosis, could not but give the impression of an experiment carried out in the laboratory. Repeating, as it is induced in analytic treatment according to the newer technique, on the other hand, implies conjuring up a piece of real life; and for that reason it cannot always be harmless and unobjectionable. This consideration opens up the whole problem of what is so often unavoidable – 'deterioration during treatment'.

First and foremost, the initiation of the treatment in itself brings about a change in the patient's conscious attitude to his illness. He has usually been content with lamenting it, despising it as nonsensical and underestimating its importance; for the rest, he has extended to its manifestations the ostrich-like policy of repression which he adopted towards its origins. Thus it can happen that he does not properly know under what conditions his phobia breaks out or does not listen to the precise wording of his obsessional ideas [*Zwangsideen*] or does not grasp the actual purpose of his obsessional impulse [*Zwangsimpulses*].[1] The treatment, of course, is not helped by this. He must find the courage to direct his attention to the phenomena of his illness. His illness itself must no longer seem to him contemptible, but must become an enemy worthy of his mettle, a piece of his personality, which has solid ground for its existence and out of which things of value for his future life have to be derived. The way is thus paved from the beginning for a reconciliation with the repressed material which is coming to expression in his symptoms, while at the same time place is found for a certain tolerance for the state of being ill. If this new attitude towards the illness intensifies the conflicts and brings to the fore symptoms which till then had been indistinct, one can easily console the patient by pointing out that these are only necessary and temporary aggravations and that one cannot overcome an enemy who is absent or not within range. The resistance, however, may exploit the situation for its own ends and abuse the licence
[153] to be ill. It seems to say: 'See what happens if I really give way to such things. Was I not right to consign them to repression?' Young and childish people, in particular, are inclined to make the necessity imposed by the treatment for paying attention to their illness a welcome excuse for luxuriating in their symptoms.

Further dangers arise from the fact that in the course of the treatment
Trieb new and deeper-lying drive impulses [*Triebregungen*][T], which had not hitherto made themselves felt, may come to be 'repeated'. Finally, it is possible that the patient's actions outside the transference may do him temporary harm in his ordinary life, or even have been so chosen as permanently to invalidate his prospects of recovery.

The tactics to be adopted by the physician in this situation are easily justified. For him, remembering in the old manner – reproduction in the psychical field – is the aim to which he adheres, even though he knows that such an aim cannot be achieved in the new technique. He is prepared for

1 [See examples of this in the case histories of 'Little Hans' (1909*b*), *RSE*, **10**, 95, and of the 'Rat Man' (1909*d*), ibid., **10**, 169.]

a perpetual struggle with his patient to keep in the psychical sphere all the impulses which the patient would like to direct into the motor sphere; and he celebrates it as a triumph for the treatment if he can bring it about that something that the patient wishes to discharge in action is disposed of through the work of remembering. If the attachment through transference has grown into something at all serviceable, the treatment is able to prevent the patient from executing any of the more important repetitive actions and to utilize his intention to do so *in statu nascendi* as material for the therapeutic work. One best protects the patient from injuries brought about through carrying out one of his impulses by making him promise not to take any important decisions affecting his life during the time of his treatment – for instance, not to choose any profession or definitive love object – but to postpone all such plans until after his recovery.

At the same time one willingly leaves untouched as much of the patient's personal freedom as is compatible with these restrictions, nor does one hinder him from carrying out unimportant intentions, even if they are foolish; one does not forget that it is in fact only through his own experience and mishaps that a person learns sense. There are also people whom one cannot restrain from plunging into some quite undesirable project during the treatment and who only afterwards become ready for, and accessible to, analysis. Occasionally, too, it is bound to happen that the untamed drives assert themselves before there is time to [154]
put the reins of the transference on them, or that the bonds which attach the patient to the treatment are broken by him in a repetitive action. As an extreme example of this, I may cite the case of an elderly lady who had repeatedly fled from her house and her husband in a twilight state and gone no-one knew where, without ever having become conscious of her motive for decamping in this way. She came to treatment with a marked affectionate transference which grew in intensity with uncanny rapidity in the first few days; by the end of the week she had decamped from me, too, before I had had time to say anything to her which might have prevented this repetition.

The main instrument, however, for curbing the patient's compulsion to repeat and for turning it into a motive for remembering lies in the handling of the transference. We render the compulsion harmless, and indeed useful, by giving it the right to assert itself in a definite field. We admit it into the transference as a playground [*Tummelplatz*][t] in which it is allowed to expand in almost complete freedom and in which it is expected to display to us everything in the way of pathogenic drives that

is hidden in the patient's mind. Provided only that the patient shows compliance enough to respect the necessary conditions of the analysis, we regularly succeed in giving all the symptoms of the illness a new transference meaning[1] and in replacing his ordinary neurosis with a 'transference neurosis'[2] of which he can be cured by the therapeutic work. The transference thus creates an intermediate region between illness and real life through which the transition from the one to the other is made. The new condition has taken over all the features of the illness; but it represents an artificial illness which is at every point accessible to our intervention. It is a piece of real experience, but one which has been made possible by especially favourable conditions, and it is of a provisional nature. From the repetitive reactions[3] which are exhibited in the
[155] transference we are led along the familiar paths to the awakening of the memories, which appear without difficulty, as it were, after the resistance has been overcome.

I might break off at this point but for the title of this paper, which obliges me to discuss a further point in analytic technique. The first step in overcoming the resistances is made, as we know, by the analyst's uncovering the resistance, which is never recognized by the patient, and acquainting him with it. Now it seems that beginners in analytic practice are inclined to look on this introductory step as constituting the whole of their work. I have often been asked to advise upon cases in which the doctor complained that he had pointed out his resistance to the patient and that nevertheless no change had set in; indeed, the resistance had become all the stronger, and the whole situation was more obscure than ever. The treatment seemed to make no headway. This gloomy foreboding always proved mistaken. The treatment was as a rule progressing most satisfactorily. The analyst had merely forgotten that giving the resistance a name could not result in its immediate cessation. One must allow the patient time to become more conversant with this resistance with which he has now become acquainted,[4] to *work through* it, to overcome it, by continuing, in defiance of it, the analytic work according to

1 ['*Übertragungsbedeutung*.' In the editions before 1924 this read '*Übertragungsbedingung*' ('transference determinant').]

2 [The connection between this special use of the term and the usual nosological one (to denote the hysterias and obsessional neurosis) is indicated in Lecture XXVII of the *Introductory Lectures* (1916–17*a*), *RSE*, **16**, 393.]

3 [In the first edition only, this read 'repetitive actions'.]

4 ['. . . *sich in den ihm nun bekannten Widerstand zu vertiefen*.' Thus in the first edition only. In all the later German editions '*nun bekannten*' was altered to '*unbekannten*'. This, however, seems to make less good sense: 'to become more conversant with the resistance that is unknown to him.']

the fundamental rule of analysis. Only when the resistance is at its height can the analyst, working in common with his patient, discover the repressed drive impulses which are feeding the resistance; and it is this kind of experience which convinces the patient of the existence and power of such impulses. The doctor has nothing else to do than to wait and let things take their course, a course which cannot be avoided nor always hastened. If he holds fast to this conviction he will often be spared the illusion of having failed when in fact he is conducting the treatment on the right lines.

This working through of the resistances may in practice turn out to be an arduous task for the subject of the analysis and a trial of patience for the analyst. Nevertheless, it is a part of the work which effects the greatest changes in the patient and which distinguishes analytic treatment from any kind of treatment by suggestion. From a theoretical point of [156] view one may correlate it with the 'abreacting' of the quotas of affect strangulated by repression – an abreaction without which hypnotic treatment remained ineffective.[1]

1 [The concept of 'working through' [*Durcharbeitens*], introduced in the present paper, is evidently related to the 'psychical inertia' which Freud discusses in several places. Some of these are enumerated in an Editors' footnote to a paper on a case of paranoia (1915*f*), *RSE*, **14**, 269 *n.* In Chapter XI, Section A (*a*) of *Inhibitions, Symptoms and Anxiety* (1926*d*), ibid., **20**, 139 ff., Freud attributes the necessity for 'working through' to the resistance of the unconscious (or of the id), a subject to which he returns in Section VI of 'Analysis Terminable and Interminable' (1937*c*), ibid., **23**, 218.]

When this paper was first published (early in 1915), its title ran: 'Weitere Ratschläge zur Technik der Psychoanalyse (III): Bemerkungen über die Übertragungsliebe'. The title of the English translation of 1924, as given above, is a rendering of this. The German editions from 1924 onwards adopted the shorter title.

Ernest Jones tells us (1955, 266) that Freud considered this the best of the present series of technical papers. A letter written by Freud to Ferenczi on December 13, 1931, in connection with the technical innovations introduced by the latter, forms an interesting postscript to this paper. It was published by Jones towards the end of Chapter IV of the third volume of his Freud biography (1957, 174 ff.).

OBSERVATIONS ON TRANSFERENCE LOVE

(FURTHER RECOMMENDATIONS ON THE TECHNIQUE OF PSYCHOANALYSIS III)

Every beginner in psychoanalysis probably feels alarmed at first at the difficulties in store for him when he comes to interpret [*Deutung*][T] the patient's associations [*Einfälle*][T] and to deal with the reproduction of the repressed [*Verdrängten*][T]. When the time comes, however, he soon learns to look upon these difficulties as insignificant, and instead becomes convinced that the only really serious difficulties he has to meet lie in the management of the transference [*Übertragung*][T]. [159] *Verdrängung*

Among the situations which arise in this connection I shall select one which is very sharply circumscribed; and I shall select it, partly because it occurs so often and is so important in its real aspects and partly because of its theoretical interest. What I have in mind is the case in which a woman patient shows by unmistakable indications, or openly declares, that she has fallen in love, as any other mortal woman might, with the doctor who is analysing her. This situation has its distressing and comical aspects, as well as its serious ones. It is also determined by so many and such complicated factors, it is so unavoidable and so difficult to clear up, that a discussion of it to meet a vital need of analytic technique has long been overdue. But since we who laugh at other people's failings are not always free from them ourselves, we have not so far been precisely in a hurry to fulfil this task. We are constantly coming up against the obligation to professional discretion – a discretion which cannot be dispensed with in real life, but which is of no service in our science. Insofar as psychoanalytic publications are a part of real life, too, we have here an insoluble contradiction. I have recently disregarded this matter of discretion at one point,[1] and shown how this same transference situation held back the development of psychoanalytic therapy during its first decade.

1 In the first section of my contribution to the history of the psychoanalytic movement (1914*d*). [This refers to Breuer's difficulties over the transference in the case of Anna O. (*RSE*, **14**, 9 f.).]

[160] To a well-educated layman (for that is what the ideal civilized person
Kultur [*Kulturmensch*][T] is in regard to psychoanalysis) things that have to do with love are incommensurable with everything else; they are, as it were, written on a special page on which no other writing is tolerated. If a woman patient has fallen in love with her doctor it seems to such a layman that only two outcomes are possible. One, which happens comparatively rarely, is that all the circumstances allow of a permanent legal union between them; the other, which is more frequent, is that the doctor and the patient part and give up the work they have begun which was to have led to her recovery, as though it had been interrupted by some elemental phenomenon. There is, to be sure, a third conceivable outcome, which even seems compatible with a continuation of the treatment. This is that they should enter into a love relationship which is illicit and which is not intended to last for ever. But such a course is made impossible by conventional morality and professional standards. Nevertheless, our layman will beg the analyst to reassure him as unambiguously as possible that this third alternative is excluded.

It is clear that a psychoanalyst must look at things from a different point of view.

Let us take the case of the second outcome of the situation we are considering. After the patient has fallen in love with her doctor, they part; the treatment is given up. But soon the patient's condition necessitates her making a second attempt at analysis, with another doctor. The next thing that happens is that she feels she has fallen in love with this second doctor too; and if she breaks off with him and begins yet again, the same thing will happen with the third doctor, and so on. This phenomenon, which occurs without fail and which is, as we know, one of the foundations of the psychoanalytic theory, may be evaluated from two points of view, that of the doctor who is carrying out the analysis and that of the patient who is in need of it.

For the doctor the phenomenon signifies a valuable piece of enlightenment and a useful warning against any tendency to a countertransference which may be present in his own mind.[1] He must recognize
[161] that the patient's falling in love is induced by the analytic situation and is not to be attributed to the charms of his own person; so that he has no grounds whatever for being proud of such a 'conquest', as it would be called outside analysis. And it is always well to be reminded of this. For

1 [The question of the 'countertransference' [*Gegenübertragung*] had already been raised by Freud in his Nuremberg Congress paper (1910*d*), *RSE*, **11**, 132. He returns to it below, on pp. 164 f. and 168 f. Apart from these passages, it is hard to find any other explicit discussions of the subject in Freud's published works.]

the patient, however, there are two alternatives: either she must relinquish psychoanalytic treatment or she must accept falling in love with her doctor as an inescapable fate.[1]

I have no doubt that the patient's relatives and friends will decide as emphatically for the first of these two alternatives as the analyst will for the second. But I think that here is a case in which the decision cannot be left to the tender – or rather, the egoistic and jealous – concern of her relatives. The welfare of the patient alone should be the touchstone; her relatives' love cannot cure her neurosis. The analyst need not push himself forward, but he may insist that he is indispensable for the achievement of certain ends. Any relative who adopts Tolstoy's attitude to this problem can remain in undisturbed possession of his wife or daughter; but he will have to try to put up with the fact that she, for her part, retains her neurosis and the interference with her capacity for love which it involves. The situation, after all, is similar to that in a gynaecological treatment. Moreover, the jealous father or husband is greatly mistaken if he thinks that the patient will escape falling in love with her doctor if he hands her over to some kind of treatment other than analysis for combating her neurosis. The difference, on the contrary, will only be that a love of this kind, which is bound to remain unexpressed and unanalysed, can never make the contribution to the patient's recovery which analysis would have extracted from it.

It has come to my knowledge that some doctors who practise analysis frequently[2] prepare their patients for the emergence of the erotic transference or even urge them to 'go ahead and fall in love with the doctor so that the treatment may make progress'. I can hardly imagine a more senseless proceeding. In doing so, an analyst robs the phenomenon of [162]
the element of spontaneity which is so convincing and lays up obstacles for himself in the future which are hard to overcome.[3]

At first glance it certainly does not look as if the patient's falling in love in the transference could result in any advantage to the treatment. No matter how amenable she has been up till then, she suddenly loses all understanding of the treatment and all interest in it, and will not speak or hear about anything but her love, which she demands to have returned. She gives up her symptoms or pays no attention to them;

1 We know that the transference can manifest itself in other, less tender feelings, but I do not propose to go into that side of the matter here. [See the paper on 'The Dynamics of Transference' (1912*b*), p. 98 above.]

2 ['*häufig*.' In the first edition only, the word here is '*frühzeitig*' ('early').]

3 [In the first edition only, this paragraph (which is in the nature of a parenthesis) was printed in small type.]

indeed, she declares that she is well. There is a complete change of scene; it is as though some piece of make-believe had been stopped by the sudden irruption of reality – as when, for instance, a cry of fire is raised during a theatrical performance. No doctor who experiences this for the first time will find it easy to retain his grasp on the analytic situation and to keep clear of the illusion that the treatment is really at an end.

A little reflection enables one to find one's bearings. First and foremost, one keeps in mind the suspicion that anything that interferes with the continuation of the treatment may be an expression of resistance.[1] There can be no doubt that the outbreak of a passionate demand for love is largely the work of resistance. One will have long since noticed in the patient the signs of an affectionate transference, and one will have been able to feel certain that her docility, her acceptance of the analytic explanations, her remarkable comprehension and the high degree of intelligence she showed were to be attributed to this attitude towards her doctor. Now all this is swept away. She has become quite without insight and seems to be swallowed up in her love. Moreover, this change quite regularly occurs precisely at a point of time when one is having to try to bring her to admit or remember some particularly distressing and heavily repressed piece of her life history. She has been in love, therefore, for a long time; but now the resistance is beginning to make use of her love
[163] in order to hinder the continuation of the treatment, to deflect all her interest from the work and to put the analyst in an awkward position.

If one looks into the situation more closely one recognizes the influence of motives which further complicate things – of which some are connected with being in love and others are particular expressions of resistance. Of the first kind are the patient's endeavour to assure herself of her irresistibility, to destroy the doctor's authority by bringing him down to the level of a lover and to gain all the other promised advantages incidental to the satisfaction of love. As regards the resistance, we may suspect that on occasion it makes use of a declaration of love on the patient's part as a means of putting her analyst's severity to the test, so that, if he should show signs of compliance, he may expect to be taken to task for it. But above all, one gets an impression that the resistance is acting as an *agent provocateur*; it heightens the patient's state of being in love and exaggerates her readiness for sexual surrender in order to justify the workings of repression all the more emphatically, by pointing to

1 [Freud had already stated this more categorically still in the first edition of *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 462. But in 1925 he added a long footnote to the passage, explaining its sense and qualifying the terms in which he had expressed himself.]

the dangers of such licentiousness.[1] All these accessory motives, which in simpler cases may not be present, have, as we know, been regarded by Adler as the essential part of the whole process.[2]

But how is the analyst to behave in order not to come to grief over this situation, supposing he is convinced that the treatment should be carried on in spite of this erotic transference and should take it in its stride?

It would be easy for me to lay stress on the universally accepted standards of morality and to insist that the analyst must never under any circumstances accept or return the tender feelings that are offered him: that, instead, he must consider that the time has come for him to put before the woman who is in love with him the demands of social morality and the necessity for renunciation, and to succeed in making her give up her desires, and, having surmounted the animal side of herself, go on with the work of analysis.

I shall not, however, fulfil these expectations – neither the first nor the second of them. Not the first, because I am writing not for patients but for doctors who have serious difficulties to contend with, and also because in this instance I am able to trace the moral prescription back to its source, namely to expediency. I am on this occasion in the happy [164]
position of being able to replace the moral embargo with considerations of analytic technique, without any alteration in the outcome.

Even more decidedly, however, do I decline to fulfil the second of the expectations I have mentioned. To urge the patient to renounce or sublimate, to suppress her drives [*Triebunterdrückung*][T] the moment she *Trieb*
has admitted her erotic transference would be, not an analytic way of dealing with them, but a senseless one. It would be just as though, after summoning up a spirit from the underworld by cunning spells, one were to send him down again without having asked him a single question. One would have brought the repressed into consciousness, only to repress it once more in a fright. Nor should we deceive ourselves about the success of any such proceeding. As we know, the passions are little affected by sublime speeches. The patient will feel only the humiliation, and she will not fail to take her revenge for it.

Just as little can I advocate a middle course, which would recommend itself to some people as being specially ingenious. This would consist in declaring that one returns the patient's fond feelings but at the same time in avoiding any physical implementation of this fondness until one is able to guide the relationship into calmer channels and raise it to a higher

1 [Cf. pp. 150–1 above.]

2 [Cf. Adler (1911*b*, 219).]

level. My objection to this expedient is that psychoanalytic treatment is founded on truthfulness. In this fact lies a great part of its educative effect and its ethical value. It is dangerous to depart from this foundation. Anyone who has become saturated in the analytic technique will no longer be able to make use of the lies and pretences which a doctor normally finds unavoidable; and if, with the best intentions, he does attempt to do so, he is very likely to betray himself. Since we demand strict truthfulness from our patients, we jeopardize our whole authority if we let ourselves be caught out by them in a departure from the truth. Besides, the experiment of letting oneself go a little way in tender feelings for the patient is not altogether without danger. Our control over ourselves is not so complete that we may not suddenly one day go further than we had intended. In my opinion, therefore, we ought not to
Verleugnung give up [*verleugnen*]^{T} the neutrality towards the patient, which we have acquired through keeping the countertransference in check.

[165] I have already let it be understood that analytic technique requires of
Versagung the physician that he should deny [*versagen*]^{T} to the patient who is craving love the satisfaction she demands. The treatment must be carried out in abstinence. By this I do not mean physical abstinence alone, nor yet the deprivation of everything that the patient desires, for perhaps no sick person could tolerate this. Instead, I shall state it as a fundamental principle that the patient's need and longing should be allowed to persist in her, in order that they may serve as forces [*Kräfte*]^{T} impelling her to do work and to make changes, and that we must beware of appeasing those forces by means of surrogates. And what we could offer would never be anything else than a surrogate, for the patient's condition is such that, until her repressions are removed, she is incapable of getting real satisfaction.

Let us admit that this fundamental principle of the treatment being carried out in abstinence extends far beyond the single case we are considering here, and that it needs to be thoroughly discussed in order that we may define the limits of its possible application.[1] We will not enter into this now, however, but will keep as close as possible to the situation from which we started out. What would happen if the doctor were to behave differently and, supposing both parties were free, if he were to avail himself of that freedom in order to return the patient's love and to still her need for affection?

If he has been guided by the calculation that this compliance on his part will ensure his domination over his patient and thus enable him to

1 [Freud took this subject up again in his Budapest Congress paper (1919*a*), *RSE*, **17**, 156–7.]

influence her to perform the tasks required by the treatment, and in this way to liberate herself permanently from her neurosis – then experience would inevitably show him that his calculation was wrong. The patient would achieve *her* aim, but he would never achieve *his*. What would happen to the doctor and the patient would only be what happened, according to the amusing anecdote, to the pastor and the insurance agent. The insurance agent, a free-thinker, lay at the point of death and his relatives insisted on bringing in a man of God to convert him before he died. The interview lasted so long that those who were waiting outside began to have hopes. At last the door of the sick-chamber opened. The free-thinker had not been converted; but the pastor went away insured.

If the patient's advances were returned it would be a great triumph for her, but a complete defeat for the treatment. She would have succeeded in what all patients strive for in analysis – she would have succeeded in acting out [*agieren*]^{T}, in repeating in real life, what she ought only to have remembered, to have reproduced as psychical material and to have kept within the sphere of psychical events.[1] In the further course of the love relationship she would bring out all the inhibitions [*Hemmungen*]^{T} and pathological reactions of her erotic life, without there being any possibility of correcting them; and the distressing episode would end in remorse and a great strengthening of her propensity to repression. The love relationship in fact destroys the patient's susceptibility to influence from analytic treatment. A combination of the two would be an impossibility. [166]

It is, therefore, just as disastrous for the analysis if the patient's craving for love is gratified as if it is suppressed. The course the analyst must pursue is neither of these; it is one for which there is no model in real life. He must take care not to steer away from the transference love, or to repulse it or to make it distasteful to the patient; but he must just as resolutely withhold any response to it. He must keep firm hold of the transference love, but treat it as something unreal, as a situation which has to be gone through in the treatment and traced back to its unconscious origins and which must assist in bringing all that is most deeply hidden in the patient's erotic life into her consciousness and therefore under her control. The more plainly the analyst lets it be seen that he is proof against every temptation, the more readily will he be able to extract from the situation its analytic content. The patient, whose sexual repression is, of course, not yet removed but merely pushed into the

1 See the preceding paper [p. 148 above].

background, will then feel safe enough to allow all her preconditions for loving, all the phantasies springing from her sexual desires, all the detailed characteristics of her state of being in love, to come to light; and from these she will herself open the way to the infantile roots of her love.

There is, it is true, one class of women with whom this attempt to preserve the erotic transference for the purposes of analytic work without satisfying it will not succeed. These are women of elemental passionateness who tolerate no surrogates. They are children of nature
[167] who refuse to accept the psychical in place of the material, who, in the poet's words, are accessible only to 'the logic of soup, with dumplings for arguments'.[1] With such people one has the choice between returning their love or else bringing down upon oneself the full enmity of a woman scorned. In neither case can one safeguard the interests of the treatment. One has to withdraw, unsuccessful; and all one can do is to turn the problem over in one's mind of how it is that a capacity for neurosis is joined with such an intractable need for love.

Many analysts will no doubt be agreed on the method by which other women, who are less violent in their love, can be gradually made to adopt the analytic attitude. What we do, above all, is to stress to the patient the unmistakable element of resistance in this 'love'. Genuine love, we say, would make her docile and intensify her readiness to solve the problems of her case, simply because the man she was in love with expected it of her. In such a case she would gladly choose the road to completion of the treatment, in order to acquire value in the doctor's eyes and to prepare herself for real life, where this feeling of love could find a proper place. Instead of this, we point out, she is showing a stubborn and rebellious spirit, she has thrown up all interest in her treatment, and clearly feels no respect for the doctor's well-founded convictions. She is thus bringing out a resistance under the guise of being in love with him; and in addition to this she has no compunction in placing him in a cleft stick. For if he refuses her love, as his duty and his understanding compel him to do, she can play the part of a woman scorned, and then withdraw from his therapeutic efforts out of revenge and resentment, exactly as she is now doing out of her ostensible love.

As a second argument against the genuineness of this love we advance the fact that it exhibits not a single new feature arising from the present situation, but is entirely composed of repetitions and copies of earlier

1 ['Suppenlogik mit Knödelgründen', from Heine's 'Die Wanderratten'. (Misquoted by Freud: 'Knödelargumenten'.)]

reactions, including infantile ones. We undertake to prove this by a detailed analysis of the patient's behaviour in love.

If the necessary amount of patience is added to these arguments, it is usually possible to overcome the difficult situation and to continue the work with a love which has been moderated or transformed; the work then aims at uncovering the patient's infantile object choice and the phantasies woven round it.

I should now like, however, to examine these arguments with a critical [168] eye and to raise the question whether, in putting them forward to the patient, we are really telling the truth, or whether we are not resorting in our desperation to concealments and misrepresentations. In other words: can we truly say that the state of being in love which becomes manifest in analytic treatment is not a real one?

I think we have told the patient the truth, but not the whole truth regardless of the consequences. Of our two arguments the first is the stronger. The part played by resistance in transference love is unquestionable and very considerable. Nevertheless, the resistance did not, after all, *create* this love; it finds it ready to hand, makes use of it and aggravates its manifestations. Nor is the genuineness of the phenomenon disproved by the resistance. The second argument is far weaker. It is true that the love consists of new editions of old traits and that it repeats infantile reactions. But this is the essential character of every state of being in love. There is no such state which does not reproduce infantile prototypes. It is precisely from this infantile determination that it receives its compulsive character, verging as it does on the pathological. Transference love has perhaps a degree less of freedom than the love which appears in ordinary life and is called normal; it displays its dependence on the infantile pattern more clearly and is less adaptable and capable of modification; but that is all, and not what is essential.

By what other signs can the genuineness of a love be recognized? By its efficacy, its serviceability in achieving the aim of love? In this respect transference love seems to be second to none; one has the impression that one could obtain anything from it.

Let us sum up, therefore. We have no right to dispute that the state of being in love which makes its appearance in the course of analytic treatment has the character of a 'genuine' love. If it seems so lacking in normality, this is sufficiently explained by the fact that being in love in ordinary life, outside analysis, is also more similar to abnormal than to normal mental phenomena. Nevertheless, transference love is

characterized by certain features which ensure it a special position. In the first place, it is provoked by the analytic situation; secondly, it is greatly intensified by the resistance, which dominates the situation; and thirdly,
[169] it is lacking to a high degree in a regard for reality, is less sensible, less concerned about consequences and more blind in its valuation of the loved person than we are prepared to admit in the case of normal love. We should not forget, however, that these departures from the norm constitute precisely what is essential about being in love.

As regards the analyst's line of action, it is the first of these three features of transference love which is the decisive factor. He has evoked this love by instituting analytic treatment in order to cure the neurosis. For him, it is an unavoidable consequence of a medical situation, like the exposure of a patient's body or the imparting of a vital secret. It is therefore plain to him that he must not derive any personal advantage from it. The patient's willingness makes no difference; it merely throws the whole responsibility on the analyst himself. Indeed, as he must know, the patient had been prepared for no other mechanism of cure. After all the difficulties have been successfully overcome, she will often confess to having had an anticipatory phantasy at the time when she entered the treatment, to the effect that if she behaved well she would be rewarded at the end by the doctor's affection.

For the doctor, ethical motives unite with the technical ones to restrain him from giving the patient his love. The aim he has to keep in view is that this woman, whose capacity for love is impaired by infantile fixations, should gain free command over a function which is of such inestimable importance to her; that she should not, however, dissipate it in the treatment, but keep it ready for the time when, after her treatment, the demands of real life make themselves felt. He must not stage the scene of a dog-race in which the prize was to be a garland of sausages but which some humorist spoilt by throwing a single sausage on to the track. The result was, of course, that the dogs threw themselves upon it and forgot all about the race and about the garland that was luring them to victory in the far distance. I do not mean to say that it is always easy for the doctor to keep within the limits prescribed by ethics and technique. Those who are still youngish and not yet bound by strong ties may in particular find it a hard task. Sexual love is undoubtedly one of the chief things in life, and the union of mental and bodily satisfaction in the enjoyment of love is one of its culminating peaks. Apart from a few
[170] peculiar fanatics, all the world knows this and conducts its life accordingly; science alone is too delicate to admit it. Again, when a woman sues

for love, to reject and refuse is a distressing part for a man to play; and, in spite of neurosis and resistance, there is an incomparable fascination in a woman of high principles who confesses her passion. It is not a patient's crudely sensual desires which constitute the temptation. These are more likely to repel, and it will call for all the doctor's tolerance if he is to regard them as a natural phenomenon. It is rather, perhaps, a woman's subtler and aim-inhibited wishes which bring with them the danger of making a man forget his technique and his medical task for the sake of a fine experience.

And yet it is quite out of the question for the analyst to give way. However highly he may prize love, he must prize even more highly the opportunity for helping his patient over a decisive stage in her life. She has to learn from him to overcome the pleasure principle, to give up a satisfaction which lies to hand but is socially not acceptable, in favour of a more distant one, which is perhaps altogether uncertain, but which is both psychologically and socially unimpeachable. To achieve this overcoming, she has to be led through the primal period of her mental development and on that path she has to acquire the extra piece of mental freedom which distinguishes conscious mental activity – in the systematic sense – from unconscious.[1]

The analytic psychotherapist thus has a threefold battle to wage – in his own mind against the forces which seek to drag him down from the analytic level; outside the analysis, against opponents who dispute the importance he attaches to the sexual drive forces and hinder him from making use of them in his scientific technique; and inside the analysis, against his patients, who at first behave like opponents but later on reveal the overvaluation of sexual life which dominates them, and who try to make him captive to their socially untamed passion.

The lay public, about whose attitude to psychoanalysis I spoke at the outset, will doubtless seize upon this discussion of transference love as another opportunity for directing the attention of the world to the serious danger of this therapeutic method. The psychoanalyst knows that he is working with highly explosive forces and that he needs to proceed with as much caution and conscientiousness as a chemist. But when have chemists ever been forbidden, because of the danger, from [171]
handling explosive substances, which are indispensable, on account of their effects? It is remarkable that psychoanalysis has to win for itself afresh all the liberties which have long since been accorded to other medical activities. I am certainly not in favour of giving up the harmless

1 [This distinction is explained below, p. 260 f.]

methods of treatment. For many cases they are sufficient, and, when all is said, human society has no more use for the *furor sanandi*[1] than for any other fanaticism. But to believe that the psychoneuroses are to be conquered by operating with harmless little remedies is grossly to underestimate those disorders both as to their origin and their practical importance. No; in medical practice there will always be room for the '*ferrum*' and the '*ignis*' side by side with the '*medicina*';[2] and in the same way we shall never be able to do without a strictly regular, undiluted psychoanalysis which is not afraid to handle the most dangerous mental impulses [*Regungen*][T] and to obtain mastery over them for the benefit of the patient.

1 ['Passion for curing people.']

2 [An allusion to a saying attributed to Hippocrates: 'Those diseases which medicines do not cure, iron (the knife?) cures; those which iron cannot cure, fire cures; and those which fire cannot cure are to be reckoned wholly incurable.' *Aphorisms*, **VII**, 87 (*trans*. 1849).]

APPENDIX

LIST OF WRITINGS BY FREUD DEALING MAINLY WITH PSYCHOANALYTIC TECHNIQUE AND THE THEORY OF PSYCHOTHERAPY

The date at the beginning of each entry is that of the year during which the work in question was probably written. The date at the end is that of publication; and under that date fuller particulars of the work can be found in the Bibliography. [172]

1888 *Preface to the Translation of Bernheim's *De la suggestion* (1888–89*a*)
1888 *Review of Forel's *Der Hypnotism* (1889*a*)
1891 *'Hypnosis' in Bum's *Therapeutisches Lexikon* (1891*d*)
1892 *'A Case of Successful Treatment by Hypnotism' (1892–93*a*)
1894/95 *'Psychical (or Mental) Treatment' (1905*b*)
1895 *Studies on Hysteria*, Part IV (1895*d*)
1898 'Sexuality in the Aetiology of the Neuroses' (last part) (1898*a*)
1899 *The Interpretation of Dreams*, Chapter II (first part) (1900*a*)
1901 'Fragment of an Analysis of a Case of Hysteria', Chapter IV (1905*e*)

1904 'On Psychotherapy' (1905*a*)
1910 'The Future Prospects of Psychoanalytic Therapy' (1910*d*)
1910 '"Wild" Psychoanalysis' (1910*k*)
1911 'The Handling of Dream Interpretation in Psychoanalysis' (1911*e*)
1912 'The Dynamics of Transference' (1912*b*)
1912 'Recommendations to Physicians Practising Psychoanalysis' (1912*e*)
1913 'On Beginning the Treatment' (1913*c*)
1914 'Fausse Reconnaissance ("Déjà Raconté") in Psychoanalytic Treatment' (1914*a*)
1914 'Remembering, Repeating and Working Through' (1914*g*)
1914 'Observations on Transference Love' (1915*a*)
1917 *Introductory Lectures on Psychoanalysis*, Lectures XXVII and XXVIII (1916–17*a*) [173]
1918 'Lines of Advance in Psychoanalytic Therapy' (1919*a*)
1920 'A Note on the Prehistory of the Technique of Analysis' (1920*b*)
1920 *Beyond the Pleasure Principle*, Chapter III (1920*g*)
1923 'Remarks on the Theory and Practice of Dream Interpretation' (1923*c*)
1926 *The Question of Lay Analysis*, Chapter V (1926*e*)
1932 *New Introductory Lectures on Psychoanalysis*, Lecture XXXIV (last part) (1933*a*)
1937 'Analysis Terminable and Interminable' (1937*c*)
1937 'Constructions in Analysis' (1937*d*)
1938 *An Outline of Psychoanalysis*, Chapter VI (1940*a*)

* These papers are concerned only with hypnotism and suggestion.

DREAMS IN FOLKLORE

(FREUD & OPPENHEIM)
(1958 [1911])

EDITORS' NOTE

TRÄUME IM FOLKLORE

GERMAN EDITIONS

(1911 Probable date of composition.) [177]
1958 *Dreams in Folklore*, Part II, New York: International Universities Press, 69–111.
1987 *GW*, **Nachtr.**, 576–600.

ENGLISH TRANSLATIONS

'Dreams in Folklore'
1958 Ibid., Part I, New York: International Universities Press, 19–65. (Tr. A. M. O. Richards; Introd. J. Strachey.)
1958 *SE*, **12**, 180–203. (Reprint of the Richards translation, slightly revised.)

The present translation is a revised and corrected reprint of the *SE* version.

The existence of this paper, written jointly by Freud and Professor D. E. Oppenheim of Vienna, had been in effect overlooked until the summer of 1956, when Mrs Liffman, Oppenheim's daughter, then living in Australia, brought it to the notice of a New York bookseller. Soon afterwards the manuscript was acquired on behalf of the Sigmund Freud Archives by Dr Bernard L. Pacella, and it is through his generosity, and with the unfailing help of Dr K. R. Eissler, then Secretary of the Archives, that we were able to include the work in the *SE* and now the *RSE*.

David Ernst Oppenheim, Freud's collaborator in this paper, was born at Brünn, in what is now the Czech Republic, in 1881. He was a classical scholar and became professor at the Akademisches Gymnasium, a secondary school in Vienna, where he taught Greek and Latin. Ernest Jones (1955, 16) mentions him among those who attended Freud's university lectures in 1906; but his acquaintance with Freud apparently dates only from 1909. In the autumn of that year he seems to have sent Freud a [178] copy of a paper dealing with classical mythology in a way which showed a knowledge of psychoanalytic literature, for a letter of Freud's has survived (dated October 28, 1909)[1] thanking him for it in very warm terms and suggesting that he should bring his knowledge of the classics into the service of psychoanalytic studies. The outcome

1 The German text of this letter, together with an English translation, is included in the American edition of the paper.

was evidently his association with the Vienna Psychoanalytical Society, of which (again according to Jones, loc. cit.) he became a member in 1910. On April 20 of that year he opened a symposium in the Vienna Society on suicide (particularly among schoolboys), which was published in the form of a brochure (1910; see also Freud, 1910*g*; *RSE*, **11**). Oppenheim's contribution can be found there under the signature 'Unus Multorum', but it was reprinted under his own name some years later in a collective work *Heilen und Bilden*, edited by Adler & Furtmüller (1914). The published minutes of the Vienna Society show that he read three 'short communications' during 1910 and 1911, the first of which, on 'Folklore Material bearing upon Dream Symbolism' (November 16, 1910), has an evident relation to the present work. In the spring of 1911 Freud brought out the third edition of *The Interpretation of Dreams* and in this he inserted a footnote mentioning Oppenheim's work in connection with dreams in folklore and stating that a paper on the subject was shortly to appear (*RSE*, **5**, 555 *n.* 2). The footnote was omitted in all later editions. This omission, as well as the disappearance of the present paper, is no doubt accounted for by the fact that soon afterwards Oppenheim became an adherent of Adler's and, along with five other members, resigned from the Vienna Psychoanalytical Society on October 11, 1911. He died during the Second World War in the concentration camp at Theresienstadt, in which both he and his wife were interned. After the war his wife emigrated to Australia, taking with her the manuscript, which she had been able to preserve. In accordance with her wishes, its publication was withheld until after her own death.

It is possible to date Freud's share in this paper within fairly narrow limits. It cannot have been written before the early part of 1911, as is shown by a reference in it to
[179] Stekel's *Die Sprache des Traumes* which was published towards the beginning of that year (p. 191 *n.* 2 below); and it must have been completed before the final breach with Adler the same summer.

Though the manuscript as we now possess it has had no final revision by its authors, it in fact calls for very little editorial tidying up, and it gives us a clear means of judging the share taken in it by its two authors. The raw material was evidently collected by Oppenheim. This was largely derived from the periodical *Anthropophyteia* (Leipzig, 1904–13), edited by F. S. Krauss, in which Freud had always taken a special interest.[1] (Cf. his open letter to its editor, 1910*f*; *RSE*, **11**, 223 f., and his Preface to Bourke's *Scatalogic Rites of All Nations*, 1913*k*, p. 335 ff. below, which is particularly relevant to the present paper.) Oppenheim copied out this material, partly in typescript and partly by hand (adding a very few short remarks), and submitted it to Freud, who then arranged it in an appropriate sequence, pasted Oppenheim's sheets on to much larger sheets of his own, and interpolated them with a profuse commentary. Freud must then have returned the whole manuscript to Oppenheim, who seems once more to have added two or three further notes (some of them in shorthand).

In the version printed below, therefore, the contributions made by the two authors are automatically distinguished, if we leave out of account any previous interchange of views. All the raw material, printed here in somewhat smaller type, is to be attributed to Oppenheim; Freud is responsible for everything else – the introduction, the commentaries, the conclusion, and the whole arrangement of the material. The only

1 Some of the material is also taken from *Kryptadia*, a similar periodical published in Heilbronn and Paris between 1883 and 1911.

change made by the Editors has been to transfer the references from the body of the text to the footnotes. Oppenheim's very few marginal remarks have also been printed as footnotes, with their authorship specified. Some of these, however, have unfortunately become illegible.

No attempt has been made in the translation to reproduce the various dialects in which many of the original stories are written. A conventional idiom has been adopted, of a kind usually associated with folk tales. The references have been checked wherever possible, and a number of errors in them corrected.

DREAMS IN FOLKLORE

BY SIGM. FREUD &
PROF. ERNST OPPENHEIM (VIENNA)

'Celsi praetereunt austera poemata Ramnes.'
Persius, *Satirae*[I]

One of us (O.) in his studies of folklore has made two observations with [180]
regard to the dreams narrated there which seem to him worth communicating. Firstly, that the symbolism employed in these dreams coincides completely with that accepted by psychoanalysis, and secondly, that a number of these dreams are understood by the common people in the same way as they would be interpreted [*deuten*][T] by *Deutung*
psychoanalysis – that is, not as premonitions about a still unrevealed future, but as the fulfilment of wishes, the satisfaction of needs which arise during the state of sleep. Certain peculiarities of these, usually indecent, dreams, which are told as comic anecdotes, have encouraged the second of us (Fr.) to attempt an interpretation of them which has made them seem more serious and more deserving of attention.

I
PENIS SYMBOLISM IN DREAMS OCCURRING IN FOLKLORE

The dream which we introduce first, although it contains no symbolic representations, sounds almost like ridicule of the prophetic and a plea in favour of the psychological interpretation of dreams.

1 [The motto at the head of the work is in Oppenheim's writing. The quotation is actually line 342 of Horace's *Ars Poetica*. The precise sense of the words is disputed by the experts, but its application here may be paraphrased: 'Haughty persons in authority disdain poems that are lacking in charm.']

Prophetic and Psychological Dream Interpretations
Penis Symbols 1

A Dream Interpretation[1]

A girl got up from her bed and told her mother that she had had a most strange dream.

[181] 'Well, what did you dream, then?' asked her mother.

'How shall I tell you? I don't know myself what it was – some sort of long and red and blunted thing.'

'Long means a road,' said her mother reflectively, 'a long road; red means joy, but I don't know what blunted can mean.'

The girl's father, who was getting dressed meanwhile, and was listening to everything that the mother and daughter were saying, muttered at this, more or less to himself: 'It sounds rather like my cock.'[2]

It is very much more convenient to study dream symbolism in folklore than in actual dreams. Dreams are obliged to conceal things and only surrender their secrets to interpretation; these comic anecdotes, however, which are disguised as dreams, are intended as communications, meant to give pleasure to the person who tells them as well as to the listener, and therefore the interpretation is added quite unashamedly to the symbol. These stories delight in stripping off the veiling symbols.

In the following quatrain the penis appears as a sceptre:

Penis Symbols 2

Last night I dreamt
I was King of the land,
And how jolly I was
With a prick in my hand.[3]

Now compare with this the following examples in which the same symbolism is employed outside a dream.

1 'Südslavische Volksüberlieferungen, die sich auf den Geschlechtsverkehr beziehen [Southern Slav Folk Traditions concerning Sexual Intercourse]', collected and elucidated by F. S. Krauss, *Anthropophyteia*, **7** [1910], 450, No. 820.

2 [*Addition by* F. S. Krauss:] See *Anthropophyteia*, **1** [1904], 4, No. 5. Cf. further the German Jewish proverb: 'The goose dreams of maize and the betrothed girl of a prick.' [See also *The Interpretation of Dreams* (1900*a*), *RSE*, **4**, 117.]

3 'Niederösterreichische [Lower Austrian] Schnadahüpfeln', collected by Dr H. Rollett. [The *Schnadahüpfel* is a light-hearted extempore verse in four lines, the second and fourth lines rhyming, sung in Bavarian and Austrian mountain districts.] *Anthropophyteia*, **5** [1908], 151, No. 2.

I love a little lass
The prettiest I've seen,
I'll put a sceptre in your hand
And you shall be a queen.[1]

'Remember, my boy', said Napoleon, [182]
The Emperor of renown,
'So long as the prick is the sceptre
The cunt will be the crown.'[2]

A different variant of this symbolic exaltation of the genitals is favoured in the imagination of artists. A fine etching by Félicien Rops,[3] bearing the title '*Tout est grand chez les rois*' ['Everything about kings is great'], shows the naked figure of a king with the features of the *Roi Soleil* [Louis XIV], whose gigantic penis, which rises to arm level, itself wears a crown. The right hand balances a sceptre, while the left clasps a large orb, which by reason of a central cleft achieves an unmistakable resemblance to another part of the body which is the object of erotic desires.[4] The index finger of the left hand is inserted into this groove.

In the Silesian folksong that follows, the dream is only invented in order to hide a different occurrence. The penis appears here as a *worm* ('fat earthworm'), which has crawled into the girl, and at the right time crawls out again as a *little worm* (baby).[5]

Penis Symbols 3 (*Worm*)

Song of the Earthworm[6]

Asleep on the grass one day a young lass
Susanna of passion was dreaming;
A soft smile did play round her nose as she lay
While she thought of her swain and his scheming.

1 From the Austrian Alps, *Kryptadia*, **4** [1888], 111, No. 160.

2 From Gaming in Lower Austria, *Anthropophyteia*, **3** [1906], 190, No. 85, [verse] 4.

3 Rops, 1905, Plate 20.

4 [*Marginal Note by* Oppenheim:] Like the orb in Rops's picture, a Roman relief in the Amphitheatre at Nîmes shows an egg transformed into a symbol of the female sexual organs by means of a similar groove. Here, too, the male counterpart is not absent. It appears as a phallus strangely furbished up as a bird which sits on four eggs of the kind described – one might say brooding them. (Krauss, [translation of] Dulaure, p. 204, illustration No. 191. [See Dulaure, 1909.])

5 ['*Würmchen*' ('little worm') is a common German expression for 'baby'.]

6 'Schlesische Volkslieder [Silesian Folksongs]', transcribed by Dr von Waldheim, *Anthropophyteia*, **7** [1910], 369.

[183]

Then – dream full of fear! – it swift did appear
That her lover so handsome and charming
Had become as she slept a fat earthworm which crept
Right inside. What could be more alarming?

Full of dread in her heart she awoke with a start
And swift to the village she hied her
And tearfully told all the folk young and old
That an earthworm had crawled up inside her.

Her wailing and tears came at last to the ears
Of her mother who cursed and swore roundly;
With bodings of gloom she repaired to her room
And examined the maiden most soundly.

For the earthworm she sought, but alas! could find nought –
An unfortunate thing which dismayed her.
So she hurried away without further delay
To ask the wise woman to aid her.

With cunning she laid out the cards for the maid
And said: 'We must wait a while longer.
'I have questioned the Knave, but no answer he gave;
'Perhaps the Red King[1] will prove stronger.

''Tis the news that you fear which the Red King speaks clear:
'The worm really crawled in the girlie;
'But as everything bides its due times and its tides
'To catch it 'tis yet much too early.'

When Susanna had heard the lugubrious word
She went to her chamber full sadly;
Till at last there appeared the dread hour that she feared
And out crept the little worm gladly.

So be warned, every lass: do not dream on the grass,
But let poor Susanna's fate guide you,
Or – as you too may know, to your grief and your woe –
A fat earthworm will creep up inside you.[2]

The same symbolization of the penis by a *worm* is familiar from numerous obscene jokes.

1 ['*Roter König*' ('Red King') is an Austrian slang term for 'menstruation'.]

2 [*Footnote by* F. S. Krauss:] Cf. p. 359 and the Southern Slav version in Krauss, 'Die Zeugung in Sitte, Brauch und Glauben der Südslaven [Procreation in the Customs, Usages and Beliefs of the Southern Slavs]', *Kryptadia*, **6** [1899], 259–69 and 375 f.

The dream which now follows symbolizes the penis by a *dagger*: the woman who dreams it is pulling at a dagger in order to stab herself, when she is awakened by her husband and exhorted not to tear his member off. [184]

A Bad Dream[1]

A woman dreamt that things had got to such a pitch that they had nothing to eat before the holiday and could not buy anything either. Her husband had drunk up all the money. There was only a lottery ticket left and even this they really ought to pawn. But the man was still keeping it back, for the draw was to be on the second of January. He said: 'Wife, now tomorrow is the draw, let the ticket wait a while longer. If we don't win, then we must sell the ticket or pawn it.' – 'Well, the devil take it, all you've bought is worry, and you've got about as much out of it as there is milk in a billy-goat.' So the next day arrived. See, along came the newspaper man. He stopped him, took a copy and began to look down the list. He ran his eyes over the figures, he looked through every column, his number was not among them. He did not trust his eyes, looked through once again and this time sure enough he came upon the number of his ticket. The number was the same, but the number of the series did not fit. Once again he did not trust himself and thought to himself: 'This must be a mistake. Wait a bit, I will go to the bank and make certain one way or the other.' So he went there with his head hanging. On the way he met a second newspaper man. He bought another copy of a second paper, scanned the list and found the number of his ticket straight away. The number of the series, too, was the same as the one which included his ticket. The prize of 5,000 roubles fell to his lot. He burst into the bank, rushed up and asked them to pay out on the winning ticket at once. The banker said that they could not pay out yet, only in a week or two. He began to beg and pray: 'Please be kind, give me one thousand at least, I can get the rest later!' The banker refused, but advised him to apply to the private individual who had procured the winning lottery ticket for him. What was to be done now? Just then a little Jew appeared as though he had sprung up from the ground. He smelt a bargain and made him an offer to pay over the money at once, though instead of 5,000 only 4,000. The fifth thousand would be his own share. The man was delighted at this good fortune and decided to give the Jew the thousand, just so that he could get the money on the spot. He took the money from the Jew and handed over the ticket to him. Then he went home. On the way he went into an inn, swallowed a quick glass and from there went straight home. He walked along grinning and humming a little song. His wife saw him through the window and thought: 'Now he's certainly sold the lottery ticket; you can see he's cheerful, he's probably paid a visit to the inn and got himself drunk because he was feeling miserable.' Then he came indoors, put the money on the kitchen table and went to his wife to bring her the good news that he had won and had got the money. While they were hugging and kissing one another to their heart's content because they were so happy, their little three-year-old daughter grabbed the money and threw it into the stove. Then they came along to count the money and it was no longer there. The last bundle of notes was already on fire. In a [185]

1 [Tarasevsky (1909), 289, No. 265.]

rage the man seized hold of the little girl by the legs and dashed her against the stove. She dropped dead. Disaster stared him in the face, there was no escaping Siberia now. He seized his revolver and bang! he shot himself in the chest and dropped dead. Horrified by such a disaster, the woman snatched up a dagger and was going to stab herself. She tried to pull it out of the sheath but could not manage it however she tried. Then she heard a voice as though from Heaven: 'Enough, let go! What are you doing?' She woke up and saw that she was not pulling at a dagger but at her husband's tool, and he was saying: 'Enough, let go or you'll tear it off!'

The representation of the penis as a weapon, cutting knife,[1] dagger, etc., is familiar to us from the anxiety dreams of abstinent women in particular and also lies at the root of numerous phobias in neurotic people. The complicated disguise of this present dream, however, demands that we should make an attempt to clarify our understanding of it by a psychoanalytic interpretation based on interpretations already carried out. In doing so we are not overlooking the fact that we shall be going beyond the material presented in the folk tale itself and that consequently our conclusions will lose in certainty.

Since this dream ends in an act of sexual aggression carried out by the woman as a dream action,[2] this suggests that we should take the state of *material* need in the content of the dream as a substitute for a state of *sexual* need. Only the most extreme libidinal compulsion can at all
[186] justify such aggressiveness on the part of a woman. Other pieces of the dream content point in a quite definite and different direction. The blame for this state of need is ascribed to the man. (He had drunk up all the money.)[3] The dream goes on to get rid of the man and the child and skilfully evades the sense of guilt attached to these wishes by causing the child to be killed by the man who then commits suicide out of remorse. Since this is the content of the dream we are led to conclude from many analogous instances that here is a woman who is not satisfied by her husband and who in her phantasies is longing for another marriage. It is all one for the interpretation whether we like to regard this

1 [*Marginal Note by* Oppenheim:] A knife is habitually carried by a burglar ['*Einbrecher*', literally 'someone who breaks in']. The kind of breaking in intended is shown by a proverbial phrase from Solingen [in the industrial Rhineland], reported in *Anthropophyteia*, **5** [1908], 182 [No. 11]: 'After marriage comes a burglary [breaking in].' Cf. the Berlin slang term '*Brecheisen*' ['jemmy', literally 'breaking-iron'] for 'a powerful penis' (*Anthropophyteia*, **7** [1910], 33).

2 ['*Traumhandlung*.' This term is used in the present paper to describe an action which is carried out by someone in a dream but is at the same time a real action. The concept appears not to be discussed in *The Interpretation of Dreams* (1900*a*).]

3 [*Marginal Note by* Oppenheim:] Cf. further below our remarks on 'marriage portion' as a term for 'penis' and 'purse' for 'testes' and also comparisons between virility and wealth and between the thirst for gold and libido. [It is not clear to what remarks this reference is intended to apply.]

dissatisfaction of the dreamer's as a permanent state of want or merely as the expression of a temporary one. The lottery, which in the dream brought about a shortlived state of happiness, could perhaps be understood as a symbolic reference to marriage. This symbol has not yet been identified with certainty in psychoanalytic work, but people are in the habit of saying that marriage is a game of chance, that in marriage one either draws the winning lot or a blank.[1] The numbers, which have been enormously magnified[2] by the dream-work, could well correspond in that case to the number of repetitions of the satisfying act that are wished for. We are thus made aware that the act of pulling the man's member has not only the meaning of libidinal provocation but also the additional meaning of contemptuous criticism, as though the woman wanted to pull the member off – as the man correctly assumed – because it was no good, did not fulfil its obligations.

We should not have lingered over the interpretation of this dream and exploited it beyond its overt symbolism were it not that other dreams which likewise end in a dream action demonstrate that the common people have recognized here a typical situation which, wherever it occurs, is susceptible to the same explanation. (Cf. below, p. 195.)

II

FAECES SYMBOLISM AND RELATED DREAM ACTIONS

Psychoanalysis has taught us that in the very earliest period of childhood [187]
faeces is a highly prized substance, in relation to which coprophilic drives
find satisfaction. With the repression of these drives, which is accelerated
as much as possible by upbringing, this substance falls into contempt
and then serves conscious purposes as a means of expressing disdain and
scorn. Certain forms of mental activity such as joking are still able to
make the obstructed source of pleasure [*Lustquelle*][T] accessible for a *Lust*
brief moment, and thus show how much of the esteem in which human
beings once held their faeces still remains preserved in the unconscious.
The most important residue of this former esteem is, however, that all
the interest which the child has had in faeces is transferred in the adult
on to another material which he learns in life to set above almost every-
thing else – gold.[3] How old this connection between excrement and

1 Another dream about a lottery in this little collection confirms this suggestion. [See p. 198 f. below.]

2 Psychoanalytic experience shows that noughts appended to numbers in dreams can be ignored in interpretation. [Cf. a passage in the case of demonological neurosis (1923*d*), *RSE*, **19**, 80.]

3 Cf. 'Character and Anal Erotism' (1908*b*) [ibid., **9**, 149 ff.].

gold is can be seen from an observation by Jeremias:[1] gold, according to ancient oriental mythology, is the excrement of hell.[2]

In dreams in folklore gold is seen in the most unambiguous way to be a symbol of faeces. If the sleeper feels a need to defaecate, he dreams of gold, of treasure. The disguise in the dream, which is designed to mislead him into satisfying his need in bed, usually makes the pile of faeces serve as a sign to mark the place where the treasure is to be found; that is to say, the dream – as though by means of endopsychic perception – states outright, even if in a reversed form, that gold is a sign or a symbol for faeces.

A simple treasure or defaecation dream of this kind is the following one, related in the *Facetiae* of Poggio.

Dream Gold[3]

[188] A certain man related in company that he had dreamt he had found gold. Thereupon another man capped it with this story. (What follows is quoted verbatim.)

'My neighbour once dreamt that the Devil had led him to a field to dig for gold; but he found none. Then the Devil said: "It is there for sure, only you cannot dig it up now; but take note of the place so that you may recognize it again by yourself."

'When the man asked that the place should be made recognizable by some sign, the Devil suggested: "Just shit on it, then it will not occur to anybody that there is gold lying hidden here and you will be able to recognize the exact place." The man did so and then immediately awoke and felt that he had done a great heap in his bed.'

(We give the conclusion in summary.) As he was fleeing from the house, he put on a cap in which a cat had done its business during the same night. He had to wash his head and his hair. 'Thus his dream gold was turned to filth.'

Tarasevsky (1909, 193–5 [No. 232]) reports a similar dream from the Ukraine in which a peasant receives some treasure from the Devil, to whom he has lit a candle, and puts a pile of faeces to mark the place.[4]

We need not be surprised if the Devil appears in these two dreams as a bestower of treasure and a seducer, for the Devil – himself an angel expelled from Paradise – 'is certainly nothing else than the personification of the repressed unconscious life of the drives'.[5]

1 Jeremias (1905, 96).

2 [*Marginal Note by* Oppenheim:] Similarly in Mexico.

3 Poggio [Bracciolini] (1905, No. 130). [As will be seen, the anecdote has been slightly abbreviated by Oppenheim.]

4 [*Addition by* Oppenheim:] Attention is there drawn to parallels in *Anthropophyteia*, **4** [1907], 342–5, Nos. 580–1.

5 'Character and Anal Erotism' (1908*b*). [Cf. *RSE*, **9**, 152 f.]

The motives behind these simple comic anecdotes about dreams appear to be exhausted in a cynical delight in dirt and a malicious satisfaction over the dreamer's embarrassment. But in other dreams about treasure the form taken by the dream is varied[1] in all sorts of ways and includes diverse constituents the origin and significance of which we may well investigate. For we shall not regard even these dream contents, which are intended to provide a rationalistic justification for obtaining the satisfaction, as entirely arbitrary and meaningless.

In the two next examples, the dream is not ascribed to a person sleeping alone but to one of two sleepers – two men – who share a bed. As a result of the dream, the dreamer dirties his bedfellow.

A Lively Dream[2]

Two travelling journeymen arrived weary at an inn and asked for a night's lodging. [189]
'Yes,' said the host, 'if you are not afraid, you can have a bedroom, but it's a haunted one. If you want to stay, that's all right, and the night will cost you nothing as far as sleeping goes.' The lads asked one another: 'Are you frightened?' 'No.' Very well, so they seized another litre of wine and went to the room assigned to them.

They had hardly been lying down any time when the door opened and a white figure glided through the room. One fellow said to the other: 'Didn't you see something?' 'Yes.' 'Well, why didn't you say anything?' 'Just wait, it's going to come through the room again.' Sure enough, the figure glided in again. One of the lads jumped up swiftly, but swifter still the ghost glided out through the crack in the door. The lad, by no means slow, pulled open the door and saw the figure, a beautiful woman, already halfway down the stairs. 'What are you doing there?' the lad shouted out. The figure stood still, turned round and spoke: 'Now I am released. I have long had to wander. As a reward take the treasure which lies just at the spot where you are standing.' The lad was as much frightened as delighted, and in order to mark the place he lifted up his shirt and planted a fine pile, for he thought that no-one would wipe out that mark. But just as he was at his happiest, he felt someone suddenly seize hold of him. 'You dirty swine,' someone bellowed in his ear, 'you're shitting on my shirt.' At these coarse words the happy dreamer awoke from his fairy-tale good fortune to find himself roughly hurled out of bed.

He Shat on the Grave[3]

Two gentlemen arrived at a hotel, ate their evening meal and drank and at last wanted to go to bed. They asked the host if he would show them to a room. As the rooms were all occupied the host gave up his own bed to them, which they were both to sleep in,

1 ['*Variirt*' in the manuscript – mistranscribed as '*verwirrt*' in the printed German text.]

2 F. Wernert, 'Deutsche Bauernerzählungen gesammelt im Ober- und Unterelsass [German Peasant Tales, Collected in Upper and Lower Alsace]', *Anthropophyteia*, **3** [1906], 72, No. 15.

3 [F. S. Krauss, 'Südslavische Volksüberlieferungen, die sich auf den Geschlechtsverkehr beziehen (Southern Slav Folk Traditions concerning Sexual Intercourse)', *Anthropophyteia*, **5** (1908), 346, No. 737.]

and he would soon find a place for himself to sleep somewhere else. The two men lay down in the same bed. A spirit appeared to one of them in a dream, lit a candle and led him to the churchyard. The lychgate opened and the spirit with the candle in its hand and the man behind walked up to the grave of a maiden. When they had reached the
[190] grave, the candle suddenly went out. 'What shall I do now? How shall I tell which is the maiden's grave tomorrow, when it is day?' he asked in the dream. Then an idea came to his rescue, he pulled down his drawers and shat on the grave. When he had finished shitting, his comrade, who was sleeping beside him, struck him first on one cheek and then on the other: 'What! You'd shit right in my face?'

In these two dreams, in place of the Devil other supernatural figures appear, namely ghosts – that is, spirits of dead people. The spirit in the second dream actually leads the dreamer to the churchyard, where he is to mark a particular grave by defaecating on it. A part of this situation is very easy to understand. The sleeper knows that the bed is not the proper place for satisfying his need; hence in the dream he causes himself to be led away from it and procures a person who shows his hidden urge the right way to another place where he is permitted to satisfy his need, indeed is required by the circumstances to do so. The spirit in the second dream actually makes use of a candle when leading him, as a servant would do if he was conducting a stranger to the WC at night when it was dark. But why are these representatives of the demand for a change of scene, which the lazy sleeper wants to avoid at all costs, such uncanny individuals as ghosts and spirits of dead people? Why does the spirit in the second dream lead the way to a churchyard as if to desecrate a grave? After all, these elements seem to have nothing to do with the urge to defaecate and the symbolization of faeces by gold. There is an indication in them of an anxiety [*Angst*][T] which could perhaps be traced back to an effort to suppress the achievement of satisfaction in bed; but that anxiety would not explain the specific nature of the dream content – its reference to death. We will refrain from making an interpretation at this point and will stress further, as being in need of explanation, the fact that in both these situations, where two men are sleeping together, the uncanny element of the ghostly guide is associated with a woman. The spirit in the first dream is early on revealed as a beautiful woman who feels she is now released, and the spirit in the second dream leads the way to the grave of a girl, on which the distinguishing mark is to be placed.

Let us turn for further enlightenment to some other defaecation dreams
[191] of this kind, in which the bedfellows are no longer two men but a man

and a woman, a married couple. The satisfying action accomplished in sleep as a result of the dream seems here particularly repellent, but perhaps for that very reason conceals a special meaning.

First, however, we will introduce a dream (on account of its connection in content with those that follow) which does not strictly speaking fit in with the plan we have just put forward. It is incomplete, inasmuch as the element of the dreamer's dirtying his bedfellow, his wife, is absent. On the other hand, the connection between the urge to defaecate and the fear of death is extremely plain. The peasant, who is described as married, dreams that he is struck by lightning and that his soul flies up to Heaven. Up there he begs to be allowed to return once more to the earth in order to see his wife and children, obtains permission to transform himself into a spider and to let himself down on the thread spun by himself. The thread is too short and the effort to express still more thread out of his body results in defaecation.

Dream and Reality[1]

A peasant lay in bed and had a dream. He saw himself in the field with his oxen, ploughing. Then suddenly down came a flash of lightning and struck him dead. Then he felt quite clearly his soul [*Seele*][T] floating upwards until at last it reached Heaven. Peter stood by the entrance gates and was going to send the peasant in without more ado. But he begged to be allowed down to earth once more, so that he could at least take leave of his wife and his children. But Peter said that would not do, and once a man was in Heaven he was not allowed to return to the world. At this the peasant wept and begged pitifully, until at last Peter gave way. Now there was only one possible way for the peasant to see his family again and that was for Peter to change him into an animal and send him down. So the peasant was turned into a spider and span a long thread on which he let himself down. When he had arrived just over his homestead, at about the level of the chimneys, and could already see his children playing in the meadow, he noticed to his horror that he could not spin any further. Naturally his fear was great, for of course he wanted to get right down to the earth. So he squeezed and he squeezed to make the thread longer. He squeezed with all his might and main – there was a loud noise – and the peasant awoke. Something very human had happened to him while he slept. [192]

Here we encounter spun thread as a new symbol for evacuated faeces, although psychoanalysis furnishes us with no counterpart to this symbolization but on the contrary attributes another symbolic meaning to thread. This contradiction will be settled later on. [p. 191 below.]

The next dream, richly elaborated and pungently told, might be

1 Dr von Waldheim, 'Skatologische Erzählungen aus Preussisch-Schlesien [Scatologic Tales from Prussian Silesia]', *Anthropophyteia*, **6** [1909], 431, No. 9.

described as a 'sociable' one; it ends with the wife's being dirtied. Its points of agreement with the previous dream are, however, quite striking. The peasant is, it is true, not dead, but he finds himself in Heaven, wants to return to the earth and experiences the same difficulty over 'spinning' a sufficiently long thread to let himself down on. However, he does not make this thread for himself as a spider out of his own body, but in a less fantastic way out of everything that he can fasten together, and as the thread is still not long enough to reach, the little angels actually advise him to shit and to lengthen the rope with the turds.

The Peasant's Assumption to Heaven[1]

A peasant had the following dream. He had heard that wheat in Heaven was standing at a high price. So he thought he would like to take his wheat there. He loaded his cart, harnessed the horse and set out. He journeyed a long way till he saw the road to Heaven and followed it. Thus he came to the gates of Heaven, and look! they stood open. He charged straight forward so as to drive right inside, but he had scarcely headed the cart towards them when – crash! the gates banged shut. Then he began to beg: 'Let me in, please be kind!' But the angels did not let him in and said he had come late. Then he saw that there was no business to be done here; there was just nothing for him, and so he turned round. But look! the road he had travelled on had vanished. What was he to do? He addressed himself to the angels again. 'Little dears, please be kind and take me back to the earth, if it's possible! give me a road so that I can get home with my horse and cart!' But the angels said: 'No, child of man, your horse and cart stay here and you can go down how you please.' 'But how shall I let myself down then, I haven't any rope?' 'Just look for something to let yourself down with.' So he took the reins, the bridle and the bit, fastened them all together and began to let himself down. He crawled and he crawled and he looked down – it was still a long way to the earth. He crawled back again and lengthened the rope he
[193] had joined together by adding the girth and the traces. Then he began to climb down again and it still did not reach the earth. So he fastened on the shafts and the body of the cart. It was still too short. What was he to do next? He racked his brains and then he thought: 'Ah, I'll lengthen it with my coat and my breeches and my shirt and then with my belt.' And that is what he did, joined everything together and climbed on. When he had reached the end of the belt it was still a long way to the earth. Then he did not know what to do; he had nothing more to fasten on and it was dangerous to jump down: he might break his neck. He begged the angels again: 'Be kind, take me down to the earth!' The angels said: 'Shit, and the muck will make a rope.' So he shat and he shat almost half an hour until he had nothing left to shit with. It made a long rope and he climbed down it. He climbed and he climbed and reached the end of the rope, but it was still a long way to the earth. Then he began once more to beg the angels to take him down to the earth. But the angels said: 'Now, child of man, piss and it will make a silken thread.' The peasant pissed and he pissed, on and on, till he could do no more. He saw that it really had turned into a silken thread and he

1 Tarasevsky (1909, 196 [No. 233]).

climbed on. He climbed and he climbed and he reached the end of it, and look, it did not reach to the earth, it still needed one and a half or two fathoms. He begged the angels again to take him down. But the angels said: 'No, brother, there is no help for you now; just jump down!' The peasant dangled undecided; he could not find the courage to jump down. But then he saw that there was no other way out left to him, and bump! instead of jumping down from Heaven he came flying down from the stove and only came to his senses in the middle of the room. Then he woke up and shouted: 'Wife, wife, where are you?' His wife woke up, she heard the din and said: 'The Devil take you, have you gone mad?' She felt round about her and saw the mess: her husband had shat and pissed all over her. She began to rate and to scold him roundly. The peasant said: 'What are you screaming about? There's vexation enough anyway. The horse is lost, stayed behind in Heaven, and I was almost done for. God be thanked that I am alive at least!' 'What rubbish you're talking. You've had much too much to drink. The horse is in the stable and you were on the stove, and dirtied me all over and then jumped down.' Then the man collected himself. Only then did it dawn on him that he had merely dreamt it all; and then he told his wife the dream, how he had journeyed up to Heaven and how from there he came down to the earth again.

At this point, however, psychoanalysis forces on our attention an interpretation which changes our whole view [*Auffassung*][T] of this class of dreams. Extensible objects, so the experience of interpreting dreams tells us, are ordinarily symbols of erection.[1] In both these anecdotes of [194]
dreams the emphasis lies on the element of the thread's refusing to get long enough, and the anxiety in the dream is also attached to this same element. Thread, moreover, like all things analogous to it (cord, rope, twine, etc.), is a symbol of semen.[2] The peasant, then, is striving to produce an erection and only when this is unsuccessful does he resort to defaecation. All at once a sexual need comes into view in these dreams behind the excremental one.

This sexual need is, however, much better adapted to explain the remaining constituents of the dream's content. We are bound to admit, if we are ready to assume that these fictitious dreams are essentially correctly constructed, that the dream action with which they end must have a meaning and must be one intended by the latent thoughts of the dreamer. If the dreamer defaecates over his wife at the end of it, then the whole dream must have this as its aim and provide the reason for this outcome. It can signify nothing else but an insult to the wife, or, strictly speaking, a rejection of her. It is then easy to establish a connection

1 [*Marginal Note by* Oppenheim:] In a story which comes from Picardy, pushing a ring down on a finger serves as a symbolic way of depicting an erection. The lower the ring goes, the longer the penis becomes – the analogy naturally has a magical force. (*Kryptadia*, **1** [1883], No. 32.) [That is, it is an instance of what Frazer calls 'imitative magic'.]

2 Cf. Stekel, 1911*a*. [See also above, p. 20.]

between this and the deeper significance of the anxiety expressed in the dream.

The situation from which this last dream grows can be construed according to these suggestions as follows. The sleeper is overcome by a strong erotic need which is indicated in fairly clear symbols at the beginning of the dream. (He had heard that wheat – probably equivalent to semen – was standing at a high price. He charged forward in order to drive with his horse and cart – genital symbols – through the open gates of Heaven.) But this libidinal impulse [*Regung*]^{T} probably applies to an unattainable object. The gates close, he gives up his intention and wants to return to the earth. But his wife, who lies by him, does not attract him; he exerts himself in vain to get an erection for her. The wish to discard her in order to replace her with another and better woman is in the infantile sense a death wish. When someone cherishes such wishes in his unconscious against a person who is nevertheless really loved, they are transformed for him into fear of death, fear for his own life. Hence
[195] the presence in these dreams of the state of being dead, the assumption to Heaven, the hypocritical longing to see wife and children again. But the disappointed sexual libido finds release along the path of regression in the excremental wishful impulse, which abuses and soils the unserviceable sexual object.

If this particular dream makes an interpretation of this kind plausible, then, in view of the peculiarities of the material which the dream contains, we can succeed in proving the interpretation only by applying the same one to a whole succession of dreams with an allied content. With this aim in view, let us turn back to the dreams mentioned earlier, where we find the situation of a sleeper who has a man as his bedfellow. The connection in which the woman appears in these dreams now
Nachträglichkeit acquires an added significance in retrospect [*nachträglich*]^{T}. The sleeper, overcome by a libidinal impulse, rejects the man; he wishes him far away and a woman in his place. A death wish directed against the dreamer's unwanted male bedfellow is naturally not so severely punished by the moral censorship as one directed against his wife, but the reaction is sufficiently far-reaching to turn the wish against himself or against the female object he desires. The dreamer himself is carried off by death; not the man, but the woman the dreamer longs for, is dead. In the end, however, the rejection of the male sexual object finds an outlet in defiling him, and this is felt and avenged by the other as an affront.

Our interpretation thus fits this group of dreams. If we now turn back

to the dreams accompanied by defilement of the woman, we shall be prepared to find that elements missing or only hinted at in the dream we have taken as the type are expressed unmistakably in other similar dreams.

In the following defaecation dream the dirtying of the woman is not emphasized, but we are told quite clearly, as far as can be in the realm of symbolism, that the libidinal impulse is directed towards another woman. The dreamer does not want to dirty his own field, but intends to defaecate on his neighbour's land.

Mutton Head![1]

A peasant dreamt that he was at work in his clover field. He was overtaken by an urgent need and, since he did not want to foul his own clover, he hurried off to the tree standing in his neighbour's field, pulled down his breeches and slapped down a pat of number two on to the ground. At last, when he had happily come to an end, he wanted to clean himself and began to tear up grass with a will. But what was that? Our little peasant woke up from his sleep with a jerk, and clutched at his painfully smarting cheek which someone had just slapped. 'You deaf old mutton head!' – the peasant, coming to himself, heard his wife in bed beside him scolding. 'So you'd go on pulling the hair right off my body, would you!' [196]

Tearing out hair (grass), which here takes the place of defiling,[2] is found mentioned alongside it in the next dream. Psychoanalytic experience shows that it originates from the group of symbols concerning masturbation (*ausreissen*, *abreissen* [to pull out, to pull off]).[3]

The dreamer's death wish directed against his wife would seem to be what most requires confirming in our interpretation. But in the dream which follows next, the dreamer actually buries his wife (hypocritically designated as a treasure) by digging the vessel which contains the gold into the earth and, as is familiar to us in dreams about treasure, planting a heap of faeces on the top to mark the place. During the digging he is working his hands in his wife's vagina.[4]

1 F. Wernert, 'Deutsche Bauernerzählungen gesammelt im Ober- und Unterelsass [German Peasant Tales, Collected in Upper and Lower Alsace]', *Anthropophyteia*, **4** [1907], 138, No. 173.

2 [At this point there is a question mark by Oppenheim in the margin of the manuscript.]

3 [Cf. a footnote in *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 311 *n*. 8. These are German slang terms for 'to masturbate'. Compare the English equivalent 'to toss oneself off'.]

4 [*Marginal Note by* Oppenheim:] Significance?

The Dream of the Treasure[1]

Once upon a time a peasant had a terrible dream. It seemed to him just like it was wartime and the whole district was being plundered by the enemy soldiers. But he had a treasure that he was so scared about that he didn't rightly know what to do with it and where he should really hide it. At last he thought he would bury it in his garden, where he knew of a proper fine place. Now he dreams on further how he goes right out and comes to the place where he wants to dig up the earth so he can put the big pot in the hole. But when he looks for a tool to dig with he finds nix roundabout, and at last he has to take his hands to it. So he makes the hole with his
[197] bare hands, puts the crock with the money into it and covers the whole lot over again with earth. Now he wants to go, but he stops a while standing there and thinks to himself: 'But when the soldiers have gone away again, how'll I find my treasure then if I don't put a sign there?' And straight away he begins to hunt about; he hunts up and down and to and fro, wherever he can. No, in the end he finds nix nowhere that would show him again straight away where he has buried his money. But just then he feels a need. 'Ah,' he says to himself, 'now that'll be fine, I can shit on it.' So, of course, he pulls his breeches down right away and does a fine heap on the place where he has put the crock in. Then he sees nearby a bit of grass and is going to pull it out, so he can wipe himself with it. But that moment he gets such a fine clout that for a second he is quite silly and looks round all dazed. And straight after he hears his wife, who is quite beside herself with rage, yelling at him: 'You cheeky bastard, you good-for-nothing! D'you think I've got to put up with everything from you? First, you mess about with both hands in my cunt, then you shit on it and now you even want to pull all the hair off it!'

With this example of a dream we have returned to the treasure dreams from which we started out, and we observe that those defaecation dreams which are concerned with treasure contain little or no fear of death, whereas the others, in which the relation to death is expressed directly (dreams of an assumption to Heaven), disregard treasure and motivate the defaecation in other ways. It is almost as though the hypocritical transformation of the wife into a treasure had obviated punishment for the death wish.[2]

A death wish directed against the woman is most clearly admitted to in another dream of an assumption to Heaven, which, however, ends not in defaecating on the woman's body but in sexual activity involving her genitals, as already happened in the previous dream. The dreamer actually shortens his wife's life in order to lengthen his own, by putting oil from her lamp of life into his own. As a kind of compensation for this

1 A. Riedl, 'Schwänke und Schnurren niederösterreichischer Landleute [Comic and Curious Anecdotes from Lower-Austrian Country People]', *Anthropophyteia*, **5** [1908], 140, No. 19.

2 [*Marginal Note by* Oppenheim:] What about the treasure in the dreams of one of two male bedfellows [p. 187 above]?

undisguised hostility there appears at the end of the dream something like an attempt at a caress.

The Light of Life[1]

Saint Peter appeared to a man when he was fast asleep and led him away to Paradise. [198]
The man agreed to go with all his heart and went with Saint Peter. They wandered about in Paradise for a long time and came to a copse, which was large and spacious but kept in beautiful order, and where hanging lamps were burning on every tree. The man asked Saint Peter what this could mean. Saint Peter answered that they were hanging lamps which burnt only as long as a man lived. But as soon as the oil vanished and the lamp went out, the man had to die at once too. This interested the man very much and he asked Saint Peter if he would lead him to his own hanging lamp. Saint Peter granted his request and led him to his wife's lamp, and just by it was the man's own lamp. The man saw that his wife's lamp still had a lot of oil in it, but there was very little in his own and this made him very sorry because he would have to die soon, and he asked Saint Peter if he would pour a little more oil into his lamp. Saint Peter said that God put the oil in at the moment when a man was born and determined for each the length of his life. This made the man very downcast and he wept and wailed beside his lamp. Saint Peter said to him: 'You stay there, but I must go on – I have more to do.' The man rejoiced at this and hardly was Saint Peter out of sight when he began to dip his finger in his wife's hanging lamp and to drip the oil into his own. He did this several times and when Saint Peter approached he started up terrified, and awoke from his dream, and saw that he had been dipping his finger in his wife's cunt and then dribbling it into his mouth and licking his finger.

Note. According to a version told by a journeyman in Sarajevo, the man awoke after getting a box on the ears from his wife, whom he had awakened by fumbling around in her pudenda. Here Saint Peter is missing and instead of hanging lamps there are glasses with oil burning in them. According to a third version, which I heard from a student in Mostar, a venerable greybeard shows the man various burning candles. His own is very thin, his wife's enormously thick. In order to lengthen his life, the man then begins with burning zeal to lick the thick candle. But then he gets a tremendous clout. 'I knew that you were an ox, but I honestly didn't know that you were a swine as well,' his wife said to him, for he was licking her cunt in his sleep.

The story is extraordinarily widespread in Europe.[2]

This is the moment to recall the 'bad dream' of the woman who ended by pulling at her husband's organ as if she wanted to tear it out [pp. 183–5 above]. The interpretation which we found reason to make in that instance agrees completely with the interpretation of the defaecation dreams dreamt by men which is expounded here. In

1 Narrated by a secondary school teacher in Belgrade, based on a version told by a peasant woman from the region of Kragujevac. *Anthropophyteia*, **4** [1907], 255, No. 10.

2 [*Marginal Note by* Oppenheim:] Cf. a very similar story from Ukraine, *Kryptadia*, **5** [1898], 15.

[199] the dream of the unsatisfied wife, she, as well, shamelessly gets rid of her husband (and the child) as obstacles in the way of satisfaction.

Another defaecation dream, about whose interpretation we cannot perhaps be completely certain, suggests, however, that we should concede that there are certain differences in the purpose of these dreams, and throws new light on dreams like the ones we have just mentioned and on some that are still to follow, in which the dream action consists in a manipulation of the woman's genitals.

'*From Fright*'[1]

The Pasha passed the night with the Bey. When the next day came, the Bey[2] lay on in bed and did not want to get up. The Bey asked the Pasha: 'What did you dream?' 'I dreamt that on the minaret there was another minaret.' 'Could that really be?' wondered the Bey. 'And what else did you dream?' 'I dreamt,' he said, 'that on the minaret there stood a copper jug, and there was water in the jug. The wind blew and the copper jug rocked. Now what would you have done if you had dreamt that?' 'I should have pissed myself and shat myself as well, from fright.' 'And, you see, I only pissed myself.'

This dream calls for a symbolic interpretation, because its manifest content is quite incomprehensible whereas the symbols are unmistakably clear. Why should the dreamer really feel frightened at the sight of a water-jug rocking on the tip of a minaret? But a minaret is excellently suited to be a symbol for the penis, and the rhythmically moving water-vessel seems a good symbol of the female genitals in the act of copulation. The Pasha, then, has had a copulation dream, and if his host suggests defaecation in connection with it this makes it likely that the interpretation is to be sought in the circumstance that both of them are old and impotent men, in whom old age has occasioned the same proverbial replacement of sexual by excremental pleasure which, as we have seen, came about in the other dreams owing to the lack of an appropriate sexual object. For a man who can no longer copulate, so say the com-
[200] mon people with their crude love of truth, there still remains the pleasure of shitting; we can say of such a man there is a recurrence of anal erotism, which was there before genital erotism and was repressed and replaced by this later impulse. Defaecation dreams can thus also be impotence dreams.

1 F. S. Krauss, 'Südslavische Volksüberlieferungen, die sich auf den Geschlechtsverkehr beziehen [Southern Slav Folk Traditions concerning Sexual Intercourse]', *Anthropophyteia*, **5** [1908], 293, No. 697.

2 [This should probably read 'the Pasha', though it appears as 'the Bey' in both the German and the Slav versions in *Anthropophyteia*.]

The difference between the interpretations is not so pronounced as might appear at first sight. The defaecation dreams too, in which the victim is a woman, deal with impotence – relative impotence, at least, towards the particular person who no longer has any attraction for the dreamer. A defaecation dream thus becomes the dream of a man who can no longer satisfy a woman, as well as of a man whom a woman no longer satisfies.

The same interpretation (as an impotence dream) can also be applied to a dream in the *Facetiae* of Poggio, which manifestly, it is true, poses as the dream of a jealous man – that is, in fact, of a man who does not think he can satisfy his wife.

The Ring of Fidelity[1]

Franciscus Philelphus was jealous of his wife and became tormented by the greatest fear that she had to do with another man, and day and night he lay on the watch. Since what occupies us in waking is wont to return to us in dreams, there appeared to him during his sleep a demon, who said to him that if he would act according to his bidding his wife would always remain faithful to him. Franciscus said to him in the dream that he would be very indebted to him and promised him a reward.

'Take this ring,' replied the demon, 'and wear it on your finger with care. As long as you wear it, your wife cannot lie with any other man without your knowledge.'

As he awoke, excited with joy, he felt that he was pushing his finger into the vulva of his wife.

The jealous have no better expedient; in this way their wives can never let themselves be taken by another man without the knowledge of their husbands.

This anecdote of Poggio is considered to be the source of[2] a tale by Rabelais, which, in other respects very similar, is clearer inasmuch as it actually describes the husband bringing home a young wife in his old age, who then gives him grounds for jealous fears.[3] [201]

Hans Carvel was a learned, experienced, industrious man, a man of honour, of good understanding and judgement, benevolent, charitable to the poor and a cheerful philosopher. Withal a good companion, who was fond of a jest, somewhat corpulent and unsteady, but otherwise well set up in every way. In his old age he married the daughter of Concordat the bailiff, a young, comely, good, gay, lively and pleasing woman, merely perchance a little too friendly towards the gentlemen neighbours and menservants. So it befell that in the course of some weeks he became as jealous as a tiger and was suspicious that she might be getting her buttocks

1 Poggio [Bracciolini] (1905), 105, No. 133.

2 [The manuscript reads 'to be derived from'. But this must be a slip, since Poggio's *Facetiae* were in print by about 1470, some twenty-five years before Rabelais was born.]

3 Rabelais, *Pantagruel*, Chapter 28 of *Le Tiers Livre*.

drummed upon elsewhere. To guard against this, he related to her a whole stock of pleasing histories of the punishments for adultery, often read aloud to her lovely legends of virtuous women, preached her the gospel of chastity, wrote her a small volume of songs of praise to matrimonial fidelity, inveighed in sharp and caustic words against the wantonness of undisciplined wives and in addition to all bestowed on her a magnificent necklace set round with oriental sapphires.

But regardless of this, he saw her going about with the neighbours in such a friendly and sociable fashion that his jealousy mounted yet higher. One night at that time, as he was lying with her in bed, in the midst of these painful thoughts, he dreamt he spoke with the Fiend Incarnate and bewailed his grief to him. But the Devil comforted him, put a ring on his finger and said: 'Take this ring; as long as you carry it on your finger no other man can have carnal knowledge of your wife without your knowledge and against your will.' 'A thousand thanks, Sir Devil!' said Hans Carvel, 'I will deny [*verleugnen*][T] Mahomet before ever I take this ring from my finger.' The Devil disappeared. But Hans Carvel awoke with a joyful heart and found that he had his finger in his wife's what-d'you-call-it.

I forgot to relate how the young woman, when she felt this, jerked her buttocks backwards as if to say: 'Stop! No, no! That's not what ought to be put in there!' – which made Hans Carvel imagine that someone wanted to pull off his ring.

Is that not an infallible measure? Believe me! act after this example and take care at all times to have your wife's ring on your finger![I]

[202] The Devil, who appears here as counsellor, as he does in the treasure dreams, gives us a clue to something of the dreamer's latent thoughts. Originally at least, he was supposed to 'take' the unfaithful wife who is hard to keep a watch on.[2] He then shows in the manifest dream an infallible means of keeping her permanently. In this too we recognize an analogy with the wish to get rid of someone (death wish) in the defaecation dreams.

We will conclude this small collection of dreams by adding a lottery dream, whose connection with the others is rather slight, but which serves to confirm the suggestion which we put forward earlier [p. 185 above] that a lottery symbolizes a marriage contract.

1 [*Footnote by* Freud:] Goethe is concerned with this symbolism of the ring and the finger in a Venetian Epigram (*Paralipomena*, No. 65, Sophienausgabe, Abt. II, Bd. **5**, 381).

> Costly rings I possess! Excellent stones, engraved
> In lofty style and conception, held by the purest of gold;
> Dearly men pay for these rings, adorned with fiery stones,
> Oft have you seen them sparkle over the gaming-table.
> But one little ring I know, whose virtue is not the same,
> Which Hans Carvel once possessed, sadly, when he was old.
> Foolish he pushed in the ring the smallest of all his ten fingers,
> The eleventh, the biggest, alone is worthy and fit to be there.

2 [Here there is a question mark by Oppenheim in the margin.]

It's No Use Crying over Spilt Milk![1]

A merchant had a strange dream. He dreamt that he saw a woman's arse with everything that belonged to it. On one half was a figure 1 and on the other a 3. Before this, the merchant had had the idea of buying a lottery ticket. It seemed to him that this picture in his dream was a lucky omen. Without waiting till the ninth hour, he ran to the bank first thing in the morning, in order to buy his ticket. He arrived there and without pausing to think he demanded ticket Number Thirteen, the same figures that he had seen in his dream. After he had bought his ticket, not a day passed on which he did not look in all the newspapers to see if his number had won. After a week, or at the most after ten days, the list of the draw came out. When he looked through, he saw that his number had not been drawn but the number 103, Series 8, and that number had won 200,000 roubles. The merchant nearly tore his hair out. 'I must have made a mistake! there is something wrong!' He was beside himself, he was almost inconsolable and could not conceive what his having had such a dream could mean. Then he resolved to discuss the matter with his friend to see if he could not account for his misfortune. He met his friend and told him everything in minute detail. Then his friend said: 'Oh you simpleton! Didn't you see the nought between the number 1 and the 3 on the arse?' 'A – a – ah, the Devil take it, it never occurred to me that the arse had a nought.' 'But it was there plain and clear, only you didn't work out the lottery number right. And the number 8 belonging to the series – the cunt [203] shows you that – it's like a number 8.' – It's no use crying over spilt milk!

Our intention in putting together this short paper was twofold. On the one hand, we wanted to suggest that one should not be deterred by the often repulsively dirty and indecent nature of this popular material from seeking in it valuable confirmation of psychoanalytic views. Thus on this occasion we have been able to establish the fact that folklore interprets dream symbols in the same way as psychoanalysis, and that, contrary to loudly proclaimed popular opinion, it derives a group of dreams from needs and wishes which have become immediate. On the other hand, we should like to express the view that it is doing the common people an injustice to assume that they employ this form of entertainment merely to satisfy the coarsest desires. It seems rather that behind these ugly façades are concealed mental reactions to impressions of life which are to be taken seriously, which even strike a sad note – reactions to which common people are ready to surrender, but only if they are accompanied by a yield of coarse pleasure.

ON PSYCHOANALYSIS

(1913 [1911])

EDITORS' NOTE

ON PSYCHOANALYSIS

GERMAN EDITION

(1911 Date of composition.) [206]
1987 *GW*, **Nachtr.**, 723–9.

ENGLISH TRANSLATIONS

'On Psycho-Analysis'
1913 *Australasian Medical Congress, Transactions of the Ninth Session*, **2**, Part 8, 839–42.
1958 *SE*, **12**, 207–11. (Tr. James Strachey, modified version of the 1913 translation.)

The present translation is a revised and corrected reprint of the *SE* version.

Early in March, 1911, Freud received an invitation from Dr Andrew Davidson, the secretary of the Section of Psychological Medicine and Neurology, to send a paper to be read before the Australasian Medical Congress which was to meet in Sydney in September of that year. He despatched his paper on May 13, and it was duly read, and later published in the *Transactions* of the Congress, along with papers (also on psychoanalytic subjects) by Jung and Havelock Ellis.

The original German text has not been found, but it appears unlikely, from internal evidence, that the published version can have been written by Freud himself in English. It is more probable that it was translated from a German original, possibly in Australia. There seems to be no particular reason, therefore, for keeping to the published text, and we have accordingly made some light terminological and stylistic modifications in it.

The German text published in 1987 was a retranslation by Anna Freud from the English.

ON PSYCHOANALYSIS

In response to a friendly request by the Secretary of your Section of [207]
Neurology and Psychiatry, I venture to draw the attention of this Congress to the subject of psychoanalysis, which is being extensively studied at the present time in Europe and America.

Psychoanalysis is a remarkable combination, for it comprises not only a method of research into the neuroses but also a method of treatment based on the aetiology thus discovered. I may begin by saying that psychoanalysis is not a child of speculation, but the outcome of experience; and for that reason, like every new product of science, is unfinished. It is open to anyone to convince himself by his own investigations of the correctness of the theses embodied in it, and to help in the further development of the study.

Psychoanalysis started with researches into hysteria, but in the course of years it has extended far beyond that field of work. The *Studies on Hysteria* by Breuer and myself, published in 1895, were the beginnings of psychoanalysis. They followed in the track of Charcot's work on 'traumatic' hysteria, Liébeault's and Bernheim's investigations of the phenomena of hypnosis, and Janet's studies of unconscious mental processes. Psychoanalysis soon found itself in sharp opposition to Janet's views, because (*a*) it declined to trace back hysteria directly to congenital hereditary degeneracy, (*b*) it offered, instead of a mere description, a dynamic explanation based on the interplay of psychical forces and (*c*) it ascribed the origin of psychical dissociation (whose importance had been recognized by Janet as well) not to a [failure of][1] mental synthesis resulting from a congenital disability, but to a special psychical process known as 'repression'.

It was conclusively proved that hysterical symptoms are residues (reminiscences) of profoundly moving experiences, which have been withdrawn from everyday consciousness, and that their form is determined (in a manner that excludes deliberate action) by details [208]

1 [These words have evidently been accidentally omitted from the published text.]

of the traumatic effects of the experiences. On this view, the therapeutic prospects lie in the possibility of getting rid of this 'repression', so as to allow part of the unconscious psychical material to become conscious and thus to deprive it of its pathogenic power. This view is a dynamic one, insofar as it regards psychical processes as displacements of psychical energy which can be gauged by the amount of their effect on the affective elements. This is most significant in hysteria, where the process of 'conversion' creates the symptoms by transforming a quantity of mental impulses into somatic innervations.

The first psychoanalytic examinations and attempts at treatment were made with the help of hypnotism. Afterwards this was abandoned and the work was carried out by the method of 'free association', with the patient remaining in his normal state. This modification had the advantage of enabling the procedure to be applied to a far larger number of cases of hysteria, as well as to other neuroses and also to healthy people. The development of a special technique of interpretation became necessary, however, in order to draw conclusions from the expressed ideas of the person under investigation. These interpretations established with complete certainty the fact that psychical dissociations are maintained entirely by 'internal resistances'. The conclusion seems justified, therefore, that the dissociations have originated owing to internal conflict, which has led to the 'repression' of the underlying drive impulse. To overcome this conflict and in that way to cure the neurosis, the guiding hand of a doctor trained in psychoanalysis is required.

Furthermore, it has been shown to be true quite generally that in all neuroses the pathological symptoms are really the end products of such conflicts, which have led to 'repression' and 'splitting' of the mind. The symptoms are generated by different mechanisms: either (*a*) as formations in substitution for the repressed forces, or (*b*) as compromises between the repressing and repressed forces, or (*c*) as reaction-formations and safeguards against the repressed forces.

Researches were further extended to the conditions which determine whether or not psychical conflicts will lead to 'repression' (that is, to dissociation dynamically caused), since it goes without saying that a psychical conflict, *per se*, may also have a normal outcome. The
[209] conclusion arrived at by psychoanalysis was that such conflicts were always between the sexual drives (using the word 'sexual' in the widest sense) and the wishes and trends of the remainder of the ego. In neuroses it is the sexual drives that succumb to 'repression' and so constitute

the most important basis for the genesis of symptoms, which may accordingly be regarded as substitutes for sexual satisfactions.

Our work on the question of the disposition to neurotic affections has added the 'infantile' factor to the somatic and hereditary ones hitherto recognized. Psychoanalysis was obliged to trace back patients' mental life to their early infancy, and the conclusion was reached that inhibitions of mental development ('infantilisms') present a disposition to neurosis. In particular, we have learnt from our investigations of sexual life that there really is such a thing as 'infantile sexuality', that the sexual drive is made up of many components and passes through a complicated course of development, the final outcome of which, after many restrictions and transformations, is the 'normal' sexuality of adults. The puzzling perversions of the sexual drive which occur in adults appear to be either inhibitions of development, fixations or lop-sided growths. Thus neuroses are the negative of perversions.

The cultural development imposed on mankind is the factor which necessitates the restrictions and repressions of the sexual drive, greater or lesser sacrifices being demanded according to the individual constitution. Development is hardly ever achieved smoothly, and disturbances may occur (whether on account of the individual constitution or of premature sexual incidents) leaving behind a disposition to future neuroses. Such dispositions may remain harmless if the adult's life proceeds satisfactorily and quietly; but they become pathogenic if the conditions of mature life forbid satisfaction of the libido or make too high demands on its suppression.

Researches into the sexual activity of children have led to a further conception of the sexual drive, based not on its purposes but on its sources. The sexual drive possesses in a high degree the capacity for being diverted from direct sexual aims and for being directed towards higher aims which are no longer sexual ('sublimation'). The drive is thus enabled to make most important contributions to the social and artistic achievements of humanity.

Recognition of the simultaneous presence of the three factors of [210]
'infantilism', 'sexuality' and 'repression' constitutes the main characteristic of the psychoanalytic theory, and marks its distinction from other views of pathological mental life. At the same time, psychoanalysis has demonstrated that there is no fundamental difference, but only one of degree, between the mental life of normal people, of neurotics and of psychotics. A normal person has to pass through the same repressions and has to struggle with the same substitutive structures; the only

difference is that he deals with these events with less trouble and better success. The psychoanalytic method of investigation can accordingly be applied equally to the explanation of normal psychical phenomena, and has made it possible to discover the close relationship between pathological psychical products and normal structures such as dreams, the small blunders of everyday life, and such valuable phenomena as jokes, myths and imaginative works. The explanation of these has been carried furthest in the case of dreams, and has resulted here in the following general formula: 'A dream is a disguised fulfilment of a repressed wish.' The interpretation of dreams has as its object the removal of the disguise to which the dreamer's thoughts have been subjected. It is, moreover, a highly valuable aid to psychoanalytic technique, for it constitutes the most convenient method of obtaining insight into unconscious psychical life.

There is often a tendency in medical and especially in psychiatric circles to contradict the theories of psychoanalysis without any real study or practical application of them. This is due not only to the striking novelty of these theories and the contrast they present to the views hitherto held by psychiatrists, but also to the fact that the premises and technique of psychoanalysis are much more nearly related to the field of psychology than to that of medicine. It cannot be disputed, however, that purely medical and non-psychological teachings have hitherto done very little towards an understanding of mental life. The progress of psychoanalysis is further retarded by the dread felt by the average observer of seeing himself in his own mirror. Men of science tend to meet emotional resistances with arguments, and thus satisfy themselves to their own satisfaction! Whoever wishes not to ignore a truth will do well to distrust his antipathies, and, if he wishes to submit the theory of
[211] psychoanalysis to a critical examination, let him first analyse himself.

I cannot think that in these few sentences I have succeeded in painting a clear picture of the principles and purposes of psychoanalysis. But I will add a list of the chief publications on the subject, a study of which will give further enlightenment to any whom I may have interested.[1]

1. Breuer & Freud, *Studien über Hysterie*, 1895. Fr. Deuticke, Vienna. A portion of the above has been translated into English in 'Selected Papers on Hysteria and other Psycho-neuroses', by Dr A. A. Brill, New York, 1909.

1 [It seems worthwhile to reproduce this list as it stands in the original, if only as a reminder of the extremely limited literature on the subject available (almost the whole of it only in German) at the date at which this paper was written.]

2. Freud, *Drei Abhandlungen zur Sexualtheorie*, Vienna, 1905. English translation by Dr Brill, 'Three Contributions to the Sexual Theory', New York, 1910.
3. Freud, *Zur Psychopathologie des Alltagslebens*, S. Karger, Berlin. 3rd edition, 1910.
4. Freud, *Die Traumdeutung*, Vienna, 1900. 3rd ed., 1911.
5. Freud, 'The Origin and Development of Psycho-analysis', *Amer. J. Psychol.*, April, 1910. Also in German: *Über Psychoanalyse*. Five Lectures given at the Clark University, Worcester, Mass, 1909.
6. Freud, *Der Witz und seine Beziehung zum Unbewussten*, Vienna, 1905.
7. Freud, *Collection of Minor Papers on the Doctrine of Neuroses*, 1893–1906. Vienna, 1906.
8. Idem. A second collection. Vienna, 1909.
9. Hitschmann, [E.] *Freuds Neurosenlehre*, Vienna, 1911.
10. C. G. Jung, *Diagnostische Assoziationsstudien*. Two volumes, 1906–1910 [1906, 1909].
11. C. G. Jung, *Über die Psychologie der Dementia praecox*, 1907.
12. *Jahrbuch für psychoanalytische und psychopathologische Forschungen*, published by E. Bleuler & S. Freud, edited by Jung. Since 1909.
13. *Schriften zur angewandten Seelenkunde*. Fr. Deuticke, Vienna. Since 1907. Eleven parts, by Freud, Jung, Abraham, Pfister, Rank, Jones, Riklin, Graf, Sadger.
14. *Zentralblatt für Psychoanalyse*. Edited by A. Adler & W. Stekel. J. Bergmann, Wiesbaden. Since Sept., 1910.

FORMULATIONS ON THE TWO PRINCIPLES OF MENTAL FUNCTIONING

(1911)

EDITORS' NOTE

FORMULIERUNGEN ÜBER DIE ZWEI PRINZIPIEN DES PSYCHISCHEN GESCHEHENS

2005 *PMC*, *The Unconscious*, 1–10. (Tr. Graham Frankland.)

The present translation is a revised and corrected reprint of the *SE* version.

We learn from Ernest Jones that Freud began planning this paper in June, 1910, and was working at it simultaneously with the Schreber case history (1911*c*), p. 9 ff. above. His progress was slow, but on October 26 he spoke on the subject before the Vienna Psychoanalytical Society. He found the audience unresponsive, and was himself dissatisfied with his presentation. It was not until December that he actually began writing the paper. It was finished at the end of January, 1911, but was not published till late in the spring, when it appeared in the same issue of the *Jahrbuch* as the Schreber case.

With this well-known paper, which is one of the classics of psychoanalysis, and with the almost contemporary third section of the Schreber case history, Freud, for the first time after an interval of more than ten years, took up once again a discussion of the general theoretical hypotheses which were implied by his clinical findings.

[216] His first extensive attempt at such a discussion had been in quasi-neurological terminology in his 'Project for a Scientific Psychology' of 1895, which, however, was not published in his lifetime (Freud, 1950*a*). Chapter VII of *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, was an exposition of a very similar set of hypotheses, but this time in purely psychological terms. Much of the material in the present paper (and especially in its earlier part) is derived directly from these two sources. The work gives the impression of being in the nature of a stocktaking. It is as though Freud were bringing up for his own inspection, as it were, the fundamental hypotheses of an earlier period, and preparing them to serve as a basis for the major theoretical discussions which lay ahead in the immediate future – the paper on narcissism, for instance, and the great series of metapsychological papers.

The present exposition of his views is exceedingly condensed and is not easy to assimilate even today. Although we know now that Freud was saying very little in it that had not long been present in his mind, at the time of its publication it must have struck its readers as bewilderingly full of novelties. The paragraphs marked (1), for instance, on p. 217 f. below, would be obscure indeed to those who could have no acquaintance either with the 'Project' or with the metapsychological papers and who would have to derive what light they could from a number of almost equally condensed and quite unsystematized passages in *The Interpretation of Dreams*. It is scarcely surprising that Freud's first audience was unresponsive.

The main theme of the work is the distinction between the regulating principles (the pleasure principle and the reality principle) which respectively dominate the primary and secondary mental processes. The thesis had, in fact, already been stated in Section 1 of Part I of the 'Project' and elaborated in Sections 15 and 16 of Part I and in the later portions of Section 1 of Part III. It was again discussed in Chapter VII of *The Interpretation of Dreams* (*RSE*, **5**, 505–7 and 535 ff.). But the fullest treatment was reserved for the paper on the metapsychology of dreams (1916–17*f* [1915]), written some three years after this one. A more detailed account of the development of Freud's views on the subject of our mental attitude towards reality can be found in the Editors' Note to that paper (ibid., **14**, 195 f.).

[217] Towards the end of the work a number of other related topics are opened up, the further development of which (like that of the main theme) is left over for later investigation. The whole paper was, in fact (as Freud himself remarks), of a preparatory and exploratory nature, but it is not on that account of any less interest.

FORMULATIONS ON THE TWO PRINCIPLES OF MENTAL FUNCTIONING

We have long observed that every neurosis has as its result, and probably [218]
therefore as its purpose, a forcing of the patient out of real life, an alienating of him from reality.[1] Nor could a fact such as this escape the observation of Pierre Janet; he spoke of a loss of '*la fonction du réel*' ['the function of reality'] as being a special characteristic of neurotics, but without discovering the connection of this disturbance with the fundamental determinants of neurosis.[2] By introducing the process of repression [*Verdrängungsprozesses*]^{T} into the genesis of the neuroses we *Verdrängung*
have been able to gain some insight into this connection. Neurotics turn away from reality because they find it unbearable – either the whole or parts of it. The most extreme type of this turning away from reality is shown by certain cases of hallucinatory psychosis which seek to deny [*verleugnet*]^{T} the particular event that occasioned the outbreak of their *Verleugnung*
insanity (Griesinger).[3] But, in fact, every neurotic does the same with some fragment of reality.[4] And we are now confronted with the task of investigating the development of the relation of neurotics and of mankind in general to reality, and in this way of bringing the psychological significance of the real external world into the structure [*Gefüge*]^{T} of our theories.

In the psychology which is founded on psychoanalysis we have become [219]
accustomed to taking as our starting point the unconscious mental

1 [The idea, with the phrase 'flight into psychosis', is already to be found in Section III of Freud's first paper on 'The Neuropsychoses of Defence' (1894*a*), *RSE*, **3**, 55. The actual phrase 'flight into illness' occurs in Section B of his paper on hysterical attacks (1909*a*), ibid., **9**, 203.]

2 Janet, 1909.

3 [W. Griesinger (1817–68) was a well-known Berlin psychiatrist of an earlier generation, much admired by Freud's teacher, Meynert. The passage alluded to in the text is no doubt the one mentioned by Freud three times in *The Interpretation of Dreams* (1900*a*), *RSE*, **4**, 80 f., 119 and 204 *n.*, and again in Chapter VI of the book on *Jokes* (1905*c*), ibid., **8**, 148. In this passage Griesinger (1845, 89) drew attention to the wish-fulfilling character of both psychoses and dreams.]

4 Otto Rank (1910*b*) has recently drawn attention to a remarkably clear prevision of this causation shown in Schopenhauer's *The World as Will and Idea* [(1819), Part II (Supplements), Chapter 32].

Seele [*seelischen*][T] processes, with the peculiarities of which we have become acquainted through analysis. We consider these to be the older, primary processes, the residues of a phase of development in which they were the only kind of mental process. The governing purpose obeyed by these primary processes is easy to recognize; it is described as the pleasure–unpleasure [*Lust–Unlust*][T] principle, or more concisely the pleasure principle.[1] These processes strive towards gaining pleasure; psychical activity draws back from any event which might arouse unpleasure. (Here we have repression.) Our dreams at night and our waking tendency to tear ourselves away from distressing impressions are remnants of the dominance of this principle and proofs of its power.

I shall be returning to lines of thought which I have developed elsewhere[2] when I suggest that the state of psychical rest was originally disturbed by the peremptory demands of internal needs. When this happened, whatever was thought of (wished for) was simply presented in a hallucinatory manner, just as still happens today with our dream thoughts every night.[3] It was only the non-occurrence of the expected satisfaction, the disappointment experienced, that led to the abandonment of this attempt at satisfaction by means of hallucination. Instead of it, the psychical apparatus had to decide to form a conception of the real circumstances in the external world and to endeavour to make a real alteration in them. A new principle of mental functioning was thus introduced; what was presented in the mind was no longer what was agreeable but what was real, even if it happened to be disagreeable.[4] This setting up of the *reality principle* proved to be a momentous step.

1 [This seems to be the first appearance of the actual term 'pleasure principle'. In *The Interpretation of Dreams* it is always named the 'unpleasure principle' (e.g. *RSE*, **5**, 537).]

2 In the General Section of *The Interpretation of Dreams*. [I.e. in Chapter VII. See in particular ibid., **5**, 505–7 and 535 ff. But what follows is for the most part also foreshadowed in the 'Project' of 1895. Cf., for instance, the end of Section 11 and Section 15 of Part I.]

3 The state of sleep is able to re-establish the likeness of mental life as it was before the recognition of reality, because a prerequisite of sleep is a deliberate rejection of reality (the wish to sleep).

4 I will try to amplify the above schematic account with some further details. It will rightly be objected that an organization which was a slave to the pleasure principle and neglected the reality of the external world could not maintain itself alive for the shortest time, so that it could not have come into existence at all. The employment of a fiction like this is, however, justified when one considers that the infant – provided one includes with it the care it receives from its mother – does almost realize a psychical system of this kind. It probably hallucinates the fulfilment of its internal needs; it betrays its unpleasure, when there is an increase of stimulus and an absence of satisfaction, by the motor discharge [*Abfuhr*][T] of screaming and beating about with its arms and legs, and it then experiences the satisfaction it has hallucinated. Later, as an older child, it learns to employ these manifestations of discharge intentionally as methods of expressing its feelings. Since the later care of children is modelled on the care of infants, the dominance of the pleasure principle can really come to an end only when a child has achieved complete psychical detachment from its

(1) In the first place, the new demands made a succession of adaptations necessary in the psychical apparatus, which, owing to our insufficient or uncertain knowledge, we can only retail very cursorily. [220]

The increased significance of external reality heightened the importance, too, of the sense organs that are directed towards that external world, and of the *consciousness* attached to them. Consciousness now learnt to comprehend sensory qualities in addition to the qualities of pleasure and unpleasure which hitherto had alone been of interest to it.[1] A special function was instituted which had periodically to search the external world, in order that its data might be familiar already if an urgent internal need should arise – the function of *attention*.[2] Its activity meets the sense impressions halfway, instead of awaiting their appearance. At the same time, probably, a system of *notation* was introduced, whose task it was to lay down the results of this periodical activity of consciousness – a part of what we call *memory*. [221]

The place of repression, which excluded from cathexis [*Besetzung*][T] as productive of unpleasure some of the emerging ideas [*Vorstellungen*][T], was taken by an *impartial passing of judgement*,[3] which had to decide whether a given idea was true or false – that is, whether or not it was in agreement with reality – the decision being determined by making a comparison with the memory traces of reality.

A new function was now allotted to motor discharge, which, under the dominance of the pleasure principle, had served as a means of unburdening the mental apparatus of accretions of stimuli, and which had carried out this task by sending innervations into the interior of the body (leading to expressive movements and the play of features and to manifestations of affect). Motor discharge was now employed in the appropriate alteration of reality; it was converted into *action*.[4]

parents. – A neat example of a psychical system shut off from the stimuli of the external world, and able to satisfy even its nutritional requirements autistically (to use Bleuler's term [1912]), is afforded by a bird's egg with its food supply enclosed in its shell; for it, the care provided by its mother is limited to the provision of warmth. – I shall not regard it as a correction, but as an amplification of the schematic picture under discussion, if it is insisted that a system living according to the pleasure principle must have devices to enable it to withdraw from the stimuli of reality. Such devices are merely the correlative of 'repression', which treats internal unpleasurable stimuli as if they were external – that is to say, pushes them into the external world.

1 [This genesis of consciousness in pleasure–unpleasure perception was adumbrated in both the 'Project' and *The Interpretation of Dreams*.]

2 [Some remarks on Freud's views about attention can be found in an Editors' footnote to the metapsychological paper on 'The Unconscious' (1915*e*), *RSE*, **14**, 169 f. *n.* 3.]

3 [This notion, often repeated by Freud, appears as early as in the first edition of his book on *Jokes* (1905*c*), ibid., **8**, 152, and is examined more deeply in his late paper on 'Negation' (1925*h*), ibid., **19**, 238–41.]

4 [Cf. 'Project', Part I, Section 11; ibid., **1**.]

Restraint upon motor discharge (upon action), which then became necessary, was provided by means of the *process of thinking*, which was developed from the presentation of ideas. Thinking was endowed with characteristics which made it possible for the mental apparatus to tolerate an increased tension of stimulus while the process of discharge was postponed. It is essentially an experimental kind of acting, accompanied by displacement [*Verschiebung*]^{T} of relatively small quantities of cathexis together with less expenditure (discharge) of them.[1] For this purpose the conversion of freely displaceable cathexes into 'bound' [*gebundene*] cathexes was necessary, and this was brought about by means of raising the level of the whole cathectic process. It is probable that thinking was originally unconscious, insofar as it went beyond mere ideational presentations and was directed to the relations between impressions of objects, and that it did not acquire further qualities, perceptible to consciousness, until it became bound to verbal residues.[2]

[222] (2) A general tendency of our mental apparatus, which can be traced back to the economic principle of saving expenditure [of energy], seems to find expression in the tenacity with which we hold on to the sources of pleasure at our disposal, and in the difficulty with which we renounce them. With the introduction of the reality principle one species of thought activity was split off [*abgespalten*]; it was kept free from reality-testing and remained subordinated to the pleasure principle alone.[3] This activity is *phantasying* [*Phantasieren*]^{T}, which begins already in children's play, and later, continued as *daydreaming*, abandons dependence on real objects.

Phantasie

(3) The supersession of the pleasure principle by the reality principle, with all the psychical consequences involved, which is here schematically condensed into a single sentence, is not in fact accomplished all at once; nor does it take place simultaneously all along the line. For while this development is going on in the ego drives [*Ichtrieben*]^{T}, the sexual drives become detached from them in a very significant way. The sexual drives behave auto-erotically at first; they obtain their satisfaction in the subject's own body and therefore do not find themselves in the

Ich, Trieb

1 [Cf. 'Project', Part I, Section 18, and *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 536–7.]

2 [Cf. 'Project', Part III, Section 1, and *The Interpretation of Dreams*, ibid., **5**, 514, 545 *n.* and 551 f. This is developed further in Section VII of 'The Unconscious' (1915*e*), ibid., **14**, 177.]

3 In the same way, a nation whose wealth rests on the exploitation of the produce of its soil will yet set aside certain areas for reservation in their original state and for protection from the changes brought about by civilization [*Kultur*]^{T}. (E.g. Yellowstone Park.) [Cf. the discussions of phantasies in 'Creative Writers and Daydreaming' (1908*e*), ibid., **9**, 123 ff., and in 'Hysterical Phantasies and their Relation to Bisexuality' (1908*a*), ibid., **9**, 137 ff. The term '*Realitätsprüfung*' (reality-testing) seems to make its first appearance in this sentence.]

situation of frustration [*Versagung*][T] which was what necessitated the institution of the reality principle; and when, later on, the process of finding an object begins, it is soon interrupted by the long period of latency, which delays sexual development until puberty. These two factors – auto-erotism and the latency period – have as their result that the sexual drive is held up in its psychical development and remains far longer under the dominance of the pleasure principle, from which in many people it is never able to withdraw.

In consequence of these conditions, a closer connection arises, on the one hand, between the sexual drive and phantasy and, on the other hand, between the ego drives and the activities of consciousness. Both in healthy and in neurotic people this connection strikes us as very intimate, although the considerations of genetic [*genetischen*][T] psychology [223]
which have just been put forward lead us to recognize it as a *secondary* one. The continuance of auto-erotism is what makes it possible to retain for so long the easier momentary and imaginary satisfaction in relation to the sexual object in place of real satisfaction, which calls for effort and postponement. In the realm of phantasy, repression remains all-powerful; it brings about the inhibition [*hemmen*][T] of ideas *in statu* *Hemmung*
nascendi before they can be noticed by consciousness, if their cathexis is likely to occasion a release of unpleasure. This is the weak spot in our psychical organization; and it can be employed to bring back under the dominance of the pleasure principle thought processes which had already become rational. An essential part of the psychical disposition to neurosis thus lies in the delay in educating [*Erziehung*][T] the sexual drives to pay regard to reality and, as a corollary, in the conditions which make this delay possible.

(4) Just as the pleasure ego can do nothing but *wish*, work for a yield of pleasure, and avoid unpleasure, so the reality ego need do nothing but strive for what is *useful* and guard itself against damage.[1] Actually the substitution of the reality principle for the pleasure principle implies no deposing of the pleasure principle, but only a safeguarding of it. A momentary pleasure, uncertain in its results, is given up, but only in order to gain along the new path an assured pleasure at a later time. But the endopsychic impression made by this substitution has been so

1 The superiority of the reality ego over the pleasure ego has been aptly expressed by Bernard Shaw in these words: 'To be able to choose the line of greatest advantage instead of yielding in the direction of least resistance.' (*Man and Superman*.) [A remark made by Don Juan towards the end of the Mozartean interlude in Act III. – Much more elaborate accounts of the relations between the 'pleasure ego' and the 'reality ego' are given in 'Drives and their Vicissitudes' (1915*c*), *RSE*, **14**, 118–20, and 'Negation' (1925*h*), ibid., **19**, 237 ff.]

powerful that it is reflected in a special religious myth. The doctrine of reward in the afterlife for the – voluntary or enforced – renunciation of earthly pleasures is nothing other than a mythical projection of this revolution in the mind. Following consistently along these lines, *religions* have been able to effect absolute renunciation of pleasure in this life by means of the promise of compensation in a future existence; but they have not by this means achieved a conquest of the pleasure principle. It is *science* which comes nearest to succeeding in that conquest;
[224] science too, however, offers intellectual pleasure during its work and promises practical gain in the end.

(5) *Education* can be described without more ado as an incitement to the conquest of the pleasure principle, and to its replacement by the reality principle; it seeks, that is, to lend its help to the developmental process which affects the ego. To this end it makes use of an offer of love as a reward from the educators; and it therefore fails if a spoilt child thinks that it possesses that love in any case and cannot lose it whatever happens.

(6) *Art* brings about a reconciliation between the two principles in a peculiar way. An artist is originally a man who turns away from reality because he cannot come to terms with the renunciation of drive satisfaction which it at first demands, and who allows his erotic and ambitious wishes full play in the life of phantasy. He finds the way back to reality, however, from this world of phantasy by making use of special gifts to mould his phantasies into truths of a new kind, which are valued by men as precious reflections of reality. Thus in a certain fashion he actually becomes the hero, the king, the creator, or the favourite he desired to be, without following the long roundabout path of making real alterations in the external world. But he can only achieve this because other men feel the same dissatisfaction as he does with the renunciation demanded by reality, and because that dissatisfaction, which results from the replacement of the pleasure principle by the reality principle, is itself a part of reality.[1]

(7) While the ego goes through its transformation from a *pleasure ego* into a *reality ego*, the sexual drives undergo the changes that lead them from their original auto-erotism through various intermediate phases to object love in the service of procreation. If we are right in thinking that each step in these two courses of development may become the site of a disposition to later neurotic illness, it is plausible to suppose that the form taken by the subsequent illness (the *choice of neurosis*) will depend

1 Cf. the similar position taken by Otto Rank (1907). [See also 'Creative Writers and Day-dreaming' (1908*e*), *RSE*, **9**, 130 f., as well as the closing paragraph of Lecture XXIII of the *Introductory Lectures* (1916–17*a*), ibid., **16**, 331–2.]

on the particular phase of the development of the ego and of the libido in which the dispositional inhibition of development has occurred. Thus [225] unexpected significance attaches to the chronological features of the two developments (which have not yet been studied), and to possible variations in their synchronization.[1]

(8) The strangest characteristic of unconscious (repressed) processes, to which no investigator can become accustomed without the exercise of great self-discipline, is due to their entire disregard of reality-testing; they equate reality of thought with external actuality, and wishes with their fulfilment – with the event – just as happens automatically under the dominance of the ancient pleasure principle. Hence also the difficulty of distinguishing unconscious phantasies from memories which have become unconscious.[2] But one must never allow oneself to be misled into applying the standards of reality to repressed psychical structures [*Bildungen*][T], and on that account, perhaps, into undervaluing the importance of phantasies in the formation of symptoms on the ground that they are not actualities, or into tracing a neurotic sense of guilt back to some other source because there is no evidence that any actual crime has been committed. One is bound to employ the currency that is in use in the country one is exploring – in our case a neurotic currency. Suppose, for instance, that one is trying to solve a dream such as this. A man who had once nursed his father through a long and painful mortal illness told me that in the months following his father's death he had repeatedly dreamt that *his father was alive once more and that he was talking to him in his usual way. But he felt it exceedingly painful that his father had really died, only without knowing it*. The only way of understanding this apparently nonsensical dream is by adding 'as the dreamer wished' or 'in consequence of his wish' after the words 'that his father had really died', and by further adding 'that he [the dreamer] wished it' to the last words. The dream thought then runs: it was a painful memory for him that he had been obliged to wish for his father's death (as a release) while he was still alive, and how terrible it would have been if his father had had any suspicion of it! What we have here is thus the familiar case of self-reproaches after the loss of someone loved, and in this instance the self-reproach went back to the infantile significance of [226] death wishes against the father.[3]

1 [This theme is developed in 'The Disposition to Obsessional Neurosis' (1913*i*), p. 319 f. below.]

2 [This difficulty is discussed at length in the later part of Lecture XXIII of the *Introductory Lectures* (1916–17*a*), *RSE*, **16**, 329 ff.]

3 [This dream was added to the 1911 edition of *The Interpretation of Dreams* (1900*a*), ibid., **5**, 384, soon after the publication of the present paper.]

The deficiencies of this short paper, which is preparatory rather than expository, will perhaps be excused only in small part if I plead that they are unavoidable. In these few remarks on the psychical consequences of adaptation to the reality principle I have been obliged to adumbrate views which I should have preferred for the present to withhold and whose justification will certainly require no small effort. But I hope it will not escape the notice of the benevolent reader how in these pages too the dominance of the reality principle is beginning.

TYPES OF ONSET OF NEUROSIS

The present translation is a revised and corrected version of the one first published in 1958.

This paper appeared in the March, 1912, issue of the *Zentralblatt*. It is an expansion of some remarks contained in a paragraph of the Schreber analysis (1911*c*), p. 53 f. above, and its theme is the classification of the precipitating causes of neurotic illnesses. Freud had, of course, often dealt with it before; but in his earlier writings the position was obscured by the prominence given in them to traumatic events. After he had more or less completely abandoned the trauma theory, his interest was largely focused (e.g. in the 'Summary' at the end of the *Three Essays* (1905*d*), *RSE*, **7**, 208 ff.) on the various *predisposing* causes of neurosis. The precipitating causes are mentioned in one or two contemporary papers, but only in the most general and somewhat deprecating terms. (See, for instance, a paper on the aetiology of the neuroses (1906*a*), ibid., 7, 287–9.) It is true, however, that the notion of 'deprivation' ('*Entbehrung*') makes an occasional appearance, e.g. in 'On Psychotherapy' (1905*a*), ibid., 7, 276, but only in the sense of deprivation due to some external circumstance. The possibility of neurosis resulting from an *internal* obstacle to satisfaction emerges at a somewhat later date – in the paper, for instance, on the effects of 'civilized' morality (1908*d*), ibid., **9** – perhaps, as Freud suggests below (p. 229), under the [230]

impact of Jung's work. In the last-mentioned paper the term '*Versagung*' (here translated as 'frustration') is used to describe the internal obstacle. It reappears, but this time with reference only to *external* obstacles, in the rather earlier Schreber analysis (1911*c*) (pp. 50 and 53 f. above), as well as in two papers contemporary with this one – on the dynamics of transference (1912*b*), p. 96 above, and on the tendency to debasement in love (1912*d*), *RSE*, **11**, 169. But in the present paper, Freud used the word for the first time to introduce a more embracing concept, covering *both* kinds of obstacle.

From this time forward 'frustration' as a principal precipitating cause of neurosis became one of the most commonly used weapons in Freud's clinical armoury, and it recurs in many of his later writings. The most elaborate of these later discussions can be found in Lecture XXII of the *Introductory Lectures* (1916–17*a*), ibid., **16**. The apparently contradictory case of a person falling ill at the moment of attaining success – the very opposite of frustration – was brought up and resolved by Freud in the course of a paper on various types of character (1916*d*), ibid., **14**, 320 ff., and he returned once more to the same point in his open letter to Romain Rolland describing a visit to the Acropolis (1936*a*), ibid., **22**, 255 ff. In a passage in the case history of the 'Wolf Man' (1918*b*), Freud pointed out that there was an omission in the present list of types of onset of neurosis – the type resulting from a *narcissistic* frustration (ibid., **17**, 105 f.).

TYPES OF ONSET OF NEUROSIS

In the pages which follow, I shall describe, on the basis of impressions [231]
arrived at empirically, the changes which conditions must undergo in order to bring about the outbreak of a neurotic illness in a person with a disposition to it. I shall thus be dealing with the question of the precipitating factors of illnesses and shall have little to say about their forms. The present discussion of the precipitating causes will differ from others in that the changes to be enumerated will relate exclusively to the subject's libido. For psychoanalysis has taught us that the vicissitudes [*Schicksale*][T] of the libido are what decide in favour of nervous health or sickness. Nor are words to be wasted in this connection on the concept of disposition.[1] It is precisely psychoanalytic research which has enabled us to show that neurotic disposition lies in the history of the development of the libido, and to trace back the operative factors in that development to innate varieties of sexual [*sexuellen*][T] constitution and to influences of the external world *Sex*
experienced in early childhood.

(*a*) The most obvious, the most easily discoverable and the most intelligible precipitating cause of an onset of neurosis is to be seen in the external factor which may be described in general terms as *frustration* [*Versagung*][T]. The subject was healthy so long as his need for love was satisfied by a real object in the external world; he becomes neurotic as soon as this object is withdrawn from him without a substitute taking its place. Here happiness coincides with health and unhappiness with neurosis. It is easier for fate to bring about a cure than for the physician;[2] for it can offer the patient a substitute for the possibility of satisfaction which he has lost.

Thus with this type, to which, no doubt, the majority of human beings

1 [On this see the Editors' Note to Freud's paper on 'The Disposition to Obsessional Neurosis' (1913*i*) below, p. 309 ff.]

2 [Freud had used almost the same words in the last paragraph of his contribution to the *Studies on Hysteria* (1895*d*), *RSE*, **2**, 272.]

on the whole belong, the possibility of falling ill arises only when there is abstinence. And it may be judged from this what an important part in the
[232] causation of neuroses may be played by the limitation imposed by civil-
Kultur ization [*kulturellen*]T on the field of accessible satisfactions. Frustration has a pathogenic effect because it dams up libido, and so submits the subject to a test as to how he can tolerate this increase in psychical tension and as to what methods he will adopt for dealing with it. There are only two possibilities for remaining healthy when there is a persistent frustration of satisfaction in the real world. The first is by transforming the psychical tension into active energy which remains directed towards the external world and eventually extorts a real satisfaction of the libido from it. The second is by renouncing libidinal satisfaction, sublimating the dammed-up libido and turning it to the attainment of aims which are no longer erotic and which escape frustration. That these two possibilities are realized in men's lives proves that unhappiness does not coincide with neurosis and that frustration does not alone decide whether its victim remains healthy or falls ill. The immediate effect of frustration lies in its bringing into play the dispositional factors which have hitherto been inoperative.

Where these are present and sufficiently strongly developed, there is a risk of the libido becoming 'introverted'.[1] It turns away from reality, which, owing to the obstinate frustration, has lost its value for the sub-
Phantasie ject, and turns towards the life of phantasy [*Phantasieleben*]T, in which it
Bildung creates new wishful structures [*Wunschbildungen*]T and revives the traces of earlier, forgotten ones. In consequence of the intimate connection between the activity of phantasy and material present in everyone which
Verdrängung is infantile and repressed [*verdrängten*]T and has become unconscious, and thanks to the exceptional position enjoyed by the life of phantasy in regard to reality-testing,[2] the libido may thenceforward move on a backward course; it may follow the path of *regression* along infantile lines, and strive after aims that correspond with them. If these strivings, which are incompatible with the subject's present-day individuality, acquire enough intensity, a conflict must result between them and the other portion of his personality, which has maintained its relation to reality. This conflict is resolved by the formation of symptoms, and is followed by the
[233] onset of manifest illness. The fact that the whole process originated from

1 To use a term introduced by C. G. Jung. [1910*c*. Freud had borrowed the term earlier. See above, p. 95 *n*. 3. Some further comments on Jung's use of this term can be found in Lecture XXIII of the *Introductory Lectures* (1916–17*a*), *RSE*, **16**, 330. Freud used the term extremely seldom in his later writings.]

2 See my 'Formulations on the Two Principles of Mental Functioning' (1911*b*) [p. 218 above].

frustration in the real world is reflected in the resulting event that the symptoms, in which the ground of reality is reached once more, represent substitutive satisfactions.

(*b*) The second type of precipitating cause of falling ill is by no means so obvious as the first; and it was in fact only possible to discover it through searching analytic investigations following on the Zürich school's theory of complexes.[1] Here the subject does not fall ill as a result of a change in the external world which has replaced satisfaction with frustration, but as a result of an internal effort to obtain the satisfaction which is accessible to him in reality. He falls ill of his attempt to adapt himself to reality and to fulfil *the demands of reality* – an attempt in the course of which he comes up against insurmountable internal difficulties.

It is advisable to draw a sharp distinction between the two types of onset of illness – a sharper distinction than observation as a rule permits. In the first type what is prominent is a change in the external world; in the second type the accent falls on an internal change. In the first type the subject falls ill from an experience; in the second type it is from a developmental process. In the first case he is faced with the task of renouncing satisfaction, and he falls ill from his incapacity for resistance; in the second case his task is to exchange one kind of satisfaction for another, and he breaks down from his inflexibility. In the second case the conflict, which is between the subject's effort to remain as he is and the effort to change himself in order to meet fresh purposes and fresh demands from reality, is present from the first. In the former case the conflict only arises after the dammed-up libido has chosen other, and incompatible, possibilities of satisfaction. The part played by the conflict and the previous fixation [*Fixierung*][T] of the libido is incomparably more obvious in the second type than in the first, in which such unserviceable fixations may perhaps only emerge as a result of the external frustration.

A young man who has hitherto satisfied his libido by means of phantasies ending in masturbation, and who now seeks to replace a regime approximating to auto-erotism by the choice of a real object – or a girl who has given her whole affection to her father or brother and who must [234]
now, for the sake of a man who is courting her, allow her hitherto unconscious incestuous libidinal wishes to become conscious – or a married woman who would like to renounce her polygamous inclinations and phantasies of prostitution so as to become a faithful consort to her husband and a perfect mother to her child – all of these fall ill from the most

1 Cf. Jung (1909).

laudable efforts, if the earlier fixations of their libido are powerful enough to resist a displacement [*Verschiebung*][T]; and this point will be decided, once again, by the factors of disposition, constitution and infantile experience. All of them, it might be said, meet with the fate of the little tree in the Grimm's fairy tale, which wished it had different leaves.[1] From the hygienic point of view – which, to be sure, is not the only one to be taken into account – one could only wish for them that they had continued to be as undeveloped, as inferior and as useless as they were before they fell ill. The change which the patients strive for, but bring about only imperfectly or not at all, invariably has the value of a step forward from the point of view of real life. It is otherwise if we apply ethical standards: we see people falling ill just as often when they discard an ideal as when they seek to attain it.

In spite of the very clear differences between the two types of onset of illness that we have described, they nevertheless coincide in essentials and can without difficulty be brought together into a unity. Falling ill from frustration may also be regarded as incapacity for adaptation to reality – in the particular case, that is, in which reality frustrates satisfaction of libido. Falling ill under the conditions of the second type leads directly to a special case of frustration. It is true that reality does not here frustrate *every* kind of satisfaction; but it frustrates the one kind which the subject declares is the only possible one. Nor does the frustration come immediately from the external world, but primarily from certain trends in the subject's ego [*Ichs*][T]. Nevertheless, frustration remains the common factor and the more inclusive one. In consequence of the conflict which immediately sets in in the second type, both kinds of satisfaction – the habitual one as well as the one aimed at – are equally inhibited [*gehemmt*][T]; a damming up of libido, with all its consequences, comes about just as it does in the first case. The psychical events leading to the formation of symptoms are if anything easier to follow in the second type than in the first; for in the second type the pathogenic fixations of the libido do not need to be freshly established, but have already been in force while the subject was healthy. A certain amount of introversion of libido is, as a rule, already present; and there is a saving of some part of the subject's regression to the infantile stage, owing to the fact that his forward development has not yet completed its course.

Hemmung

[235]

(*c*) The next type, which I shall describe as falling ill from *an inhibition in development*, looks like an exaggeration of the second one – falling ill

1 [This well-known story does not, in fact, seem to be included in the Grimm collection. The episode appears in a children's poem by Rückert.]

from the *demands of reality*. There is no theoretical reason for distinguishing it, but only a practical one; for those we are here concerned with are people who fall ill as soon as they get beyond the irresponsible age of childhood, and who have thus never reached a phase of health – a phase, that is, of capacity for achievement and enjoyment [*Leistungs- und Genussfähigkeit*] which is on the whole unrestricted. The essential feature of the dispositional process is in these cases quite plain. Their libido has never left its infantile fixations; the demands of reality are not suddenly made upon a wholly or partly mature person, but arise from the very fact of growing older, since it is obvious that they constantly alter with the subject's increasing age. Thus conflict falls into the background in comparison with insufficiency. But here, too, all our other experience leads us to postulate an effort at overcoming the fixations of childhood; for otherwise the outcome of the process could never be neurosis but only a stationary infantilism.

(*d*) Just as the third type has brought the dispositional determinant before us almost in isolation, so the fourth type, which now follows, draws our attention to another factor, which comes into consideration in every single case and might easily for that very reason be overlooked in a theoretical discussion. We see people fall ill who have hitherto been healthy, who have met with no fresh experience and whose relation to the external world has undergone no change, so that the onset of their illness inevitably gives an impression of spontaneity. A closer consideration of such cases, however, shows us that nonetheless a change *has* taken place in them whose importance we must rate very highly as a cause of illness. As a result of their having reached a particular period of life, and in conformity with regular biological processes, the *quantity* of libido in their mental economy has experienced an increase which is in itself enough to upset the equilibrium of their health and to set up the necessary conditions for a neurosis. It is well known that more or less sudden increases of libido of this kind are habitually associated with puberty and the menopause – with the attainment of a certain age in women; in some people they may in addition be manifested in periodicities that are still unknown. Here the damming up of libido is the primary factor; it becomes pathogenic as a consequence of a *relative* frustration on the part of the external world, which would still have granted satisfaction to a smaller claim by the libido. The unsatisfied and dammed-up libido can once again open up paths to regression and kindle the same conflicts which we have demonstrated in the case of absolute external frustration. [236]

We are reminded in this way that the quantitative factor should not be left out of account in any consideration of the precipitating causes of illness. All the other factors – frustration, fixation, developmental inhibition – remain ineffective unless they affect a certain amount of libido and bring about a damming up of libido of a certain height. It is true that we are unable to measure this amount of libido which seems to us indispensable for a pathogenic effect; we can only postulate it after the resulting illness has started. There is only one direction in which we can determine it more precisely. We may assume that it is not a question of an *absolute* quantity, but of the relation between the quota of libido in operation and the quantity of libido which the individual ego is able to deal with – that is, to hold under tension, to sublimate or to employ directly. For this reason a *relative* increase in the quantity of libido may have the same effects as an absolute one. An enfeeblement of the ego owing to organic illness or owing to some special demand upon its energy will be able to cause the emergence of neuroses which would otherwise have remained latent in spite of any disposition that might be present.

The importance in the causation of illness which must be ascribed to *quantity* of libido is in satisfactory agreement with two main theses of the theory of the neuroses to which psychoanalysis has led us: first, the thesis that the neuroses are derived from the conflict between the ego
[237] and the libido, and secondly, the discovery that there is no *qualitative* distinction between the determinants of health and those of neurosis, and that, on the contrary, healthy people have to contend with the same tasks of mastering their libido – they have simply succeeded better in them.

It remains to say a few words on the relation of these types to the facts of observation. If I survey the set of patients on whose analysis I am at the moment engaged, I must record that not one of them is a pure example of any of the four types of onset. In each of them, rather, I find a portion of frustration operating alongside of a portion of incapacity to adapt to the demands of reality; inhibition in development, which coincides, of course, with inflexibility of fixations, has to be reckoned with in all of them, and, as I have already said, the importance of quantity of libido must never be neglected. I find, indeed, that in several of these patients their illness has appeared in successive waves, between which there have been healthy intervals, and that each of these waves has been traceable to a different type of precipitating cause. Thus the erection of these four

types cannot lay claim to any high theoretical value; they are merely different ways of establishing a particular pathogenic constellation in the mental [*seelischen*][T] economy – namely the damming up of libido, which *Seele*
the ego cannot, with the means at its command, ward off without damage. But this situation itself only becomes pathogenic as a result of a quantitative factor; it does not come as a novelty to mental life and is not created by the impact of what is spoken of as a 'cause of illness'.

A certain *practical* importance may readily be allowed to these types of onset. They are to be met with in their pure form, indeed, in individual cases; we should not have noticed the third and fourth types if they had not in some subjects constituted the sole precipitating causes of the illness. The first type keeps before our eyes the extraordinarily powerful influence of the external world, and the second the no less important influence – which opposes the former one – of the subject's peculiar individuality. Pathology could not do justice to the problem of the precipitating factors in the neuroses so long as it was merely concerned with deciding whether those affections were of an 'endogenous' or 'exogenous' nature. It was bound to meet every observation which pointed to the importance of abstinence (in the widest sense of the [238]
word) as a precipitating cause with the objection that other people tolerate the same experiences without falling ill. If, however, it sought to lay stress on the peculiar individuality of the subject as being the essential factor decisive between illness and health, it was obliged to put up with the proviso that people possessing such a peculiarity can remain healthy indefinitely, just so long as they are able to retain that peculiarity. Psychoanalysis has warned us that we must give up the unfruitful contrast between external and internal factors, between experience and constitution,[1] and has taught us that we shall invariably find the cause of the onset of neurotic illness in a particular psychical situation which can be brought about in a variety of ways.

1 [A long discussion of this can be found in a footnote to Freud's paper on 'The Dynamics of Transference' (1912*b*), published a couple of months before the present paper. See above, p. 93 *n.* 2. The 'unfruitful contrast' is, however, to some extent pursued in 'The Disposition to Obsessional Neurosis' (1913*i*), p. 313 ff. below.]

'Masturbation'
1921 *Medical Critic and Guide* (New York), **24** (September), 327–34. (Omitting 'Introduction'.) (Tr. Eden Paul.)
'Contributions to a Discussion on Masturbation'
1958 *SE*, **12**, 243–54. (Tr. James Strachey.)

The present translation is a revised and corrected reprint of the *SE* version.

The discussion on masturbation held in the Vienna Psychoanalytical Society was much more prolonged than the earlier one on suicide, Freud's contributions to which were similarly published (1910*g*), *RSE*, **11**. The minutes of the Society, printed in Volume II of the *Zentralblatt für Psychoanalyse* (1911–12), show that fourteen members (including Freud) took part in the discussions, which occupied nine evenings, from November 22, 1911, to April 24, 1912. It was on this last occasion that Freud made his concluding remarks, described in the minutes as an 'Epilogue'. The 'Introduction' was not delivered at a meeting, but is merely the preface to the pamphlet in which the papers were ultimately published.

This work contains by far the fullest discussion of masturbation that is to be found in Freud's writings, though short allusions to it are frequent enough. In his early papers masturbation figures chiefly on account of its relation to the 'actual neuroses' and in particular as a causative agent of neurasthenia. (See, for instance, Section II of his French paper on the aetiology of the neuroses, 1896*a*; *RSE*, **3**.) It is interesting to find Freud stoutly defending that position in the present work and taking the [242]

opportunity of giving one of his few later pronouncements on the 'actual neuroses' in general (p. 243 ff. below).[1]

After these early papers, Freud's first important account of masturbation appeared in Section 4 of the second of his *Three Essays* (1905*d*), *RSE*, **7**, 164 ff. Here for the first time he brought out the significance of masturbation in early childhood. But it was only in the third (1915) edition of that work (that is to say, *after* the date of the present discussion) that the existence of three distinct phases of masturbation was clearly shown. (See ibid., **7**, 167, footnote 3.) Nor was that distinction made plain in Freud's next longish reference to the subject, in the 'Rat Man' case history (1909*d*), ibid., **10**, 154–6. Two other important points were, however, made in papers of about this same period: the connection of masturbation with phantasies, in the paper on hysterical phantasies (1908*a*), ibid., **9**, and its connection with the threat of castration, in the paper on infantile sexual theories (1908*c*), ibid., **9**, and, of course, in the analysis of 'Little Hans' (1909*b*), ibid., **10**. A short passage in the paper on the effects of 'civilized' morality (1908*d*), ibid., **9**, should also be mentioned, in which the objections to masturbation are put forward on lines similar to those in the present paper. Incidentally, Freud there remarks that a person's sexual behaviour often 'lays down the pattern' for his whole way of reacting to the external world (ibid., **9**, 172); and this no doubt explains the obscure reference below, in paragraph (*b*), p. 247, to 'the laying down of a psychical pattern'.

It is a curious fact that, apart from his discussions of the feelings of guilt attached to masturbation and of the special characteristics of masturbation in girls, to which attention is drawn in footnotes below on pp. 242 and 243 *n.* 1, almost all of Freud's later references to the topic occur in relation to the dread of castration. His interest in the other aspects of the subject seems to have been exhausted in his present contribution.[2]

1 A full list of references appears in an Editors' footnote to the paper on 'wild' psychoanalysis (1910*k*), *RSE*, **11**, 216 *n.* 1.

2 See, however, footnote 2, p. 249 below.

CONTRIBUTIONS TO A DISCUSSION ON MASTURBATION

I
INTRODUCTION

It is never the aim of the discussions in the Vienna Psychoanalytical Society to remove diversities or to arrive at conclusions. The different speakers, who are held together by taking a similar fundamental view of the same facts, allow themselves to give the sharpest expression to the variety of their individual opinions without any regard to the probability of converting any of their audience who may think otherwise. There may be many points in these discussions which have been misstated and misunderstood, but the final outcome, nevertheless, is that everyone has received the clearest impression of views differing from his own and has communicated his own differing views to other people. [243]

The discussion on masturbation, of which actually only fragments are published here, lasted for several months and was conducted on the plan of each speaker in turn reading a paper, which was followed by an exhaustive debate. Only the actual papers are included in the present publication, and not the debates, which were highly stimulating and in which the differing opinions were expressed and defended. This pamphlet would otherwise have attained dimensions which would certainly have stood in the way of its being widely read and proving effective.

The choice of the topic calls for no apologies in these days when an attempt is at last being made to subject the problems of man's sexual life [*Sexuallebens*][T] to a scientific examination. Numerous repetitions of the same thoughts and assertions were unavoidable: they are, of course, the signs of agreement between the speakers. As regards the many divergences in their views, it can no more be an editor's task to harmonize them than it is to attempt to hide them. It is to be hoped that the reader's interest will be repelled neither by the repetitions nor by the contradictions. *Sex*

It has been our purpose on this occasion to show the direction into [244]

which the study of the problem of masturbation has been forced by the emergence of the psychoanalytic method of approach. How far we have succeeded in that purpose will appear from our readers' applause, or perhaps still more clearly from their disapproval.

Vienna, Summer, 1912

II
CONCLUDING REMARKS

Gentlemen, the older members of this group will be able to recall that [245]
some years ago we made a previous attempt at a collective discussion of this kind – a 'symposium', as our American colleagues call it – on the subject of masturbation.[1] At that time the opinions expressed showed such important divergences that we did not venture to lay our proceedings before the public. Since then the same group, together with some newcomers, having been uninterruptedly in touch with observed facts, and having had a constant interchange of ideas with one another, have so far clarified their views and arrived at common ground that the venture which we previously abandoned now no longer seems so rash. I really have an impression that the points on which we are agreed in connection with masturbation are now firmer and more deep-going than the disagreements – though these undeniably exist. Some of the apparent contradictions are only the result of the many different directions from which you have approached the subject, whereas in fact the opinions in question may quite well find a place alongside one another.

With your permission I will set before you a summary of the points on which we seem to be agreed or divided.

We are all *agreed*, I feel,

(*a*) on the importance of the phantasies [*Phantasien*][T] which accompany or represent the act of masturbation,

(*b*) on the importance of the sense of guilt, whatever its source may be, which is attached to masturbation, and

(*c*) on the impossibility of assigning a qualitative determinant for the injurious effects of masturbation. (On this last point agreement is not unanimous.)

Unresolved differences of opinion have appeared

(*a*) in respect to a denial of a somatic factor in the effects of masturbation,

(*b*) in respect to a general denial of the injurious effects of masturbation,

(*c*) with regard to the origin of the sense of guilt, which some of you [246]
wish to attribute directly to lack of satisfaction, while others adduce

1 [This earlier discussion seems to have occurred on May 25, and June 1 and 8, 1910.]

social factors in addition, or the attitude of the subject's personality at the moment,[1] and

(*d*) with regard to the ubiquity of masturbation in children.

Lastly, significant *uncertainties* exist

(*a*) as to the mechanism of the injurious effects of masturbation, if there are any, and

(*b*) as to the aetiological relation of masturbation to the 'actual neuroses' [*Aktualneurosen*][T].

As regards the majority of the points of controversy among us, we have to thank the challenging criticisms of our colleague Wilhelm Stekel, based on his great and independent experience. There is no doubt that we have left very many points over to be established and clarified by some future band of observers and enquirers. But we may console ourselves with the knowledge that we have worked honestly and in no narrow spirit, and that in so doing we have opened up paths along which later research will be able to travel.

You must not expect much from my own contributions to the questions we are concerned with. You are aware of my preference for the fragmentary treatment of a subject, with emphasis on the points which seem to me best established. I have nothing new to offer – no solutions, only a few repetitions of things I have already maintained, a few words in defence of these old assertions against attacks made upon them by some of you, and, in addition, a few comments which must inevitably force themselves on anyone listening to your papers.

I have, as you know, divided masturbation according to the subject's age into (1) masturbation in infants, which includes all auto-erotic activities serving the purpose of sexual satisfaction, (2) masturbation in children, which arises directly out of the preceding kind and has already become fixed to certain erotogenic zones, and (3) masturbation at puberty, which is either continuous with childhood masturbation or is separated from it by the period of latency. In some of the accounts which
[247] I have heard you give, full justice has not quite been done to this temporal division. The ostensible unity of masturbation, which is fostered by the customary medical terminology, has given rise to some generalizations where a differentiation according to the three periods of life would have been better justified. It has been a matter for regret, too, that we

1 [Freud's own views on the question of why a sense of guilt attaches to masturbation can be found in a footnote added in 1915 and 1920 to the *Three Essays* (1905*d*), *RSE*, **7**, 168 *n.*, and in a passage in "'A Child is Being Beaten'" (1919*e*), ibid., **17**, 189.]

have not been able to pay as much attention to female as to male masturbation; female masturbation, I believe, is deserving of a special study and in its case it is particularly true that a special emphasis lies on the modifications in it that arise in relation to the subject's age.[1]

I come now to the objections raised by Reitler to my teleological argument in favour of the ubiquity of masturbation in infancy. I admit that this argument must be abandoned. If one more edition of my *Three Essays on the Theory of Sexuality* is called for, it will not contain the sentence under attack. I will renounce my attempt at guessing the purposes of Nature and will content myself with describing the facts.[2]

Another remark of Reitler's is, I think, significant and important. This was to the effect that certain arrangements in the genital apparatus which are peculiar to human beings seem to tend towards preventing sexual intercourse in childhood. Here, however, my doubts arise. The occlusion of the female sexual orifice and the absence of an *os penis* which would assure erection are, after all, directed only against actual coition, not against sexual excitations [*Erregungen*][T] in general. Reitler seems to me to take too anthropomorphic a view of the way in which Nature pursues her aims – as though it were a question of her carrying through a single purpose, as is the case with human activity. But so far as we can see, in natural processes a whole number of aims are pursued alongside one another, without interfering with one another. If we are to speak of Nature in human terms, we shall have to say that she appears to us to be what, in the case of men, we should call inconsistent. For my part, I think Reitler should not attach so much weight to his own teleological arguments. The use of teleology as a heuristic hypothesis has its dubious side: in any particular instance one can never tell whether one has hit upon a 'harmony' or a 'disharmony'. It is the same as when one drives a nail into the wall of a room: one cannot be certain whether one is going to come up against lath and plaster or brickwork. [248]

On the question of the relation of masturbation and emissions to the causation of so-called 'neurasthenia', I find myself, like many of you, in opposition to Stekel, and, subject to a limitation which I shall mention presently, I maintain, as against him, my former views. I see nothing that could oblige us to abandon the distinction between 'actual neuroses' and psychoneuroses, and I cannot regard the genesis of the symptoms in the

1 [Freud had discussed female masturbation in his *Three Essays* (1905*d*), *RSE*, **7**, 194 f. He returned to it in several later works, always insisting on its originally clitoridal nature: e.g. in the paper on sex distinction (1925*j*), ibid., **19**, Section II of 'Female Sexuality' (1931*b*), ibid., **21**, and Lecture XXXIV of his *New Introductory Lectures* (1933*a*), ibid., **22**.]

2 [The change was duly made in the 1915 edition of the book. See ibid., **7**, 167 *n*. 1.]

case of the former as anything but toxic. Here Stekel really seems to me greatly to overstretch psychogenicity. My view is still what it was in the first instance, more than fifteen years ago: namely, that the two 'actual neuroses' – neurasthenia and anxiety neurosis (and perhaps we ought to add hypochondria proper as a third 'actual neurosis')[1] – provide the psychoneuroses with the necessary 'somatic compliance';[2] they provide the excitatory material, which is then psychically selected and given a 'psychical coating', so that, speaking generally, the nucleus of the psychoneurotic symptom – the grain of sand at the centre of the pearl – is formed of a somatic sexual manifestation.[3] This is clearer, it is true, of anxiety neurosis and its relation to hysteria than it is of neurasthenia, into which no careful psychoanalytic investigations have yet been made. In anxiety neurosis, as you have often been able to convince yourselves, it is at bottom a small fragment of undischarged excitation connected with coition which emerges as an anxiety symptom or provides the
Bildung nucleus for the formation of a hysterical symptom [*Symptombildung*]^{T}.

Stekel shares with many non-psychoanalytic writers an inclination to reject the morphological differentiations which we have made within the
[249] jumble of the neuroses and to lump them all together under one heading – under psychasthenia, perhaps. We have often contradicted him on this, and have held fast to our expectation that the morphologico-clinical differences will prove valuable as indications that have not yet been understood of essentially distinct processes. When he – justly – points out to us that he has regularly found the same complexes present in what are termed neurasthenics as in other neurotics, his argument fails to meet the point at issue. We have long known that the same complexes and conflicts are to be looked for, too, in all normal and healthy people. In fact, we have grown accustomed to attributing to every civilized human
Kultur being [*Kulturmenschen*]^{T} a certain amount of repression [*Verdrängung*]^{T} of perverse impulses, a certain amount of anal erotism, of homosexuality and so on, as well as a piece of father complex and mother complex and of other complexes besides – just as in the chemical analysis of an organic substance we have every hope of finding certain elements: carbon, oxygen, hydrogen, nitrogen and a trace of sulphur. What distinguishes organic substances from one another is the relative

1 [Freud had already hinted at this in a footnote to the Schreber case (see above, p. 49 *n.* 3), and he returned to the subject later, in the second section of his paper on narcissism (1914*c*), *RSE*, **14**, 72.]

2 [The term used by Freud in explaining the mechanism of hysteria in his 'Dora' analysis (1905*e*), ibid., **7**, 37.]

3 [Cf. again the case of 'Dora', ibid., 7, 73.]

amounts of these elements and the way in which the links between them are constituted. In the same way, in the case of normal and neurotic people what is in question is not whether these complexes and conflicts *exist* but whether they have become pathogenic and, if so, by means of what mechanisms they have become so.

The essence of the theories about the 'actual neuroses' which I have put forward in the past and am defending today lies in my assertion, based on experiment, that their symptoms, unlike psychoneurotic ones, cannot be analysed. That is to say, the constipation, headaches and fatigue of the so-called neurasthenic do not admit of being traced back historically or symbolically to operative experiences and cannot be understood as substitutes for sexual satisfaction or as compromises between opposing drive impulses, as is the case with psychoneurotic symptoms (even though the latter may perhaps have the same appearance). I do not believe it will be possible to upset this assertion by the help of psychoanalysis. On the other hand, I will grant today what I was unable to believe formerly – that an analytic treatment can have an indirect curative effect on 'actual' symptoms. It can do so either by enabling the current noxae to be better tolerated, or by enabling the sick person to escape from the current noxae by making a change in his sexual [250] regime. These would be desirable prospects from the point of view of our therapeutic interest.

If in the end I am convicted of being in error over the theoretical problem of the 'actual neuroses', I shall be able to console myself with the advance in our knowledge, which must disregard the opinions of an individual. You may then ask why, since I have such a laudable appreciation of the limitations of my own infallibility, I do not at once give in to these new suggestions but prefer to re-enact the familiar comedy of an old man obstinately clinging to his opinions.[1] My reply is that I do not yet see any evidence to induce me to give in. In early days I made a number of alterations in my views and did not conceal them from the public. I was reproached on account of these changes, just as today I am reproached for my conservativeness. Not that I should be intimidated by the one reproach or the other. But I know that I have a destiny to fulfil. I cannot escape it and I need not move towards it. I shall await it, and in the meantime I shall behave towards our science as earlier experience has taught me.

I am loath to take up a position on the question that has been dealt with by you so extensively of the injuriousness of masturbation, for it

1 [Freud was almost exactly 56 at this time.]

offers no proper approach to the problems which concern us. But we must all do so, no doubt: the world seems to feel no other interest in masturbation. You will recall that at our former series of discussions on the subject we had among us as a visitor a distinguished Viennese paediatrician. What was it that he repeatedly asked us to tell him? Simply, how far masturbation is injurious and why it injures some people but not others. So we must force our researches to make a pronouncement to meet this practical demand.

I must confess that here again I am unable to share Stekel's point of view, in spite of the many courageous and correct comments that he has made to us on the question. As he sees it, the injuriousness of masturbation amounts to no more than a senseless prejudice which, purely as a result of personal limitations, we are unwilling to cast off with sufficient thoroughness. I believe, however, that if we fix our eyes on the problem *sine ira et studio*[1] – so far, of course, as we are able to – we shall be obliged
[251] to declare, rather, that to take up such a position contradicts our fundamental views on the aetiology of the neuroses. Masturbation corresponds essentially to infantile sexual activity and to its subsequent retention at a more mature age. We derive the neuroses from a conflict between a person's sexual urges and his other (ego) [*Ich*][T] trends. Now someone might say: 'In my view the pathogenic factor in this aetiological relation lies solely in the ego's reaction to its sexuality.' By this he would be asserting that anyone could keep free of neurosis if only he were willing to allow unrestricted satisfaction to his sexual urges. But it is clearly arbitrary, and evidently pointless as well, to come to such a decision, and not to allow the sexual urges themselves to have any share in the pathogenic process. But if you admit that the sexual urges [*Strebungen*] can have a pathogenic effect, you should no longer deny a similar significance to masturbation, which after all consists only in carrying out such sexual drive impulses. In every case which seems to show that masturbation is pathogenic, you will, no doubt, be able to trace the operation further back – to the drives which manifest themselves in the masturbation and to the resistances which are directed against those drives. Masturbation is not anything ultimate – whether somatically or psychologically – it is not a real 'agent', but merely the name for certain activities. Yet, however much we may trace things further back, our judgement on the causation of the illness will nevertheless rightly remain attached to this activity. And do not forget that masturbation is not to be equated with sexual activity in general: it is sexual activity subjected to certain limiting conditions.

1 ['Without bitterness or partiality.' Tacitus, *Annals*, I, 1.]

Thus it also remains possible that it is precisely these peculiarities of masturbatory activity which are the vehicles of its pathogenic effects.

We are therefore brought back once more from arguments to clinical observation, and we are warned by it not to strike out the heading 'Injurious Effects of Masturbation'. We are at all events confronted in the neuroses with cases in which masturbation has done damage.

This damage seems to occur in three different ways:

(*a*) *Organic* injury may occur by some unknown mechanism. Here we must take into account the considerations of excess and of inadequate satisfaction, which have often been mentioned by you.

(*b*) The injury may occur through the laying down of a *psychical pattern* according to which there is no necessity for trying to alter the external world in order to satisfy a great need.[1] Where, however, a far-reaching reaction against this pattern develops, the most valuable character traits may be initiated. [252]

(*c*) A *fixation of infantile sexual aims* may be made possible, and a persistence of psychical infantilism. Here we have the disposition for the occurrence of a neurosis. As psychoanalysts we cannot fail to be greatly interested in this result of masturbation – which in this case means, of course, masturbation occurring at puberty and continued afterwards. We must keep in mind the significance which masturbation acquires as a carrying into effect of phantasy [*Phantasie*]^{T} – that halfway region interpolated between life in accordance with the pleasure principle [*Lustprinzip*]^{T} and life in accordance with the reality principle; and we must remember how masturbation makes it possible to bring about sexual developments and sublimations in phantasy, which are nevertheless not advances but injurious compromises – though it is true, as an important remark of Stekel's has pointed out, that this same compromise renders severe perverse inclinations harmless and averts the worst consequences of abstinence. *Lust*

On the basis of my medical experience, I cannot rule out a permanent reduction in potency as one among the results of masturbation, though I will grant to Stekel that in a number of cases it may turn out to be only apparent. This particular result of masturbation, however, cannot be classed unhesitatingly among the injurious ones. Some diminution of male potency and of the brutal aggressiveness involved in it is much to the purpose from the point of view of civilization. It facilitates the practice by civilized men of the virtues of sexual moderation and

1 [See the Editors' Note, p. 238 above.]

trustworthiness that are incumbent on them. Virtue accompanied by full potency is usually felt as a hard task.

This may strike you as cynical, but you may rest assured that it is not cynically meant. It sets out to be no more than a piece of dry description, without regard to whether it may cause satisfaction or annoyance. For masturbation, like so many other things, has *les défauts de ses vertus* and, on the other hand, *les vertus de ses défauts*. If one is disentangling an involved and complex subject with a one-sided practical interest in its harmfulness and uses, one must put up with unwelcome discoveries.

[253] Furthermore, I think we may with advantage distinguish what we may describe as the *direct* injuries caused by masturbation from those which arise *indirectly* from the ego's resistance and indignation against that sexual activity. I have not entered into these latter consequences.

And now I am obliged to add a few words on the second of the two painful questions we have been asked. Assuming that masturbation can be injurious, under what conditions and in what people does it prove to be so?

Like the majority of you, I am inclined to refuse to give a general answer to the question. It partly coincides with another, more comprehensive question: when does sexual activity in general become pathogenic for particular people? If we put this consideration on one side, we are left with a question of detail relating to the characteristics of masturbation insofar as it represents a special manner and form of sexual satisfaction. Here it would be to the point to repeat what is already known to us and has been discussed in other connections – to assess the influence of the *quantitative* factor and of the combined operation of several pathogenic factors. Above all, however, we should have to leave a wide field for what are known as an individual's constitutional dispositions. But it must be confessed that dealing with these is an awkward business. For we are in the habit of forming our opinion of individual dispositions *ex post facto*: we attribute this or that disposition to people after the event [*nachträglich*][T], when they have already fallen ill. We have no method of discovering it beforehand. We behave, in fact, like the Scottish king in one of Victor Hugo's novels,[1] who boasted of an infallible method of recognizing witchcraft. He had the accused woman stewed in boiling water and then tasted the broth. He then judged according to the taste: 'Yes, that was a witch', or 'No, that was not one.'

Nachträglichkeit

There is another question that I might draw your attention to, which

1 [This has not been traced. – The anecdote will be met with again in a similar connection near the end of Lecture XXXIV of the *New Introductory Lectures* (1933*a*), *RSE*, **22**, 137.]

has been dealt with too little in our discussions: that of 'unconscious' masturbation. I mean masturbation during sleep, during abnormal states, or fits. You will recall the many hysterical fits in which masturbatory acts recur in a disguised or unrecognizable way, after the subject has renounced that form of satisfaction, and the many symptoms in obsessional neurosis which seek to replace and repeat this kind of [254] sexual activity, which has formerly been forbidden.[1] We may also speak of a therapeutic return of masturbation. A number of you will have found on occasion, as I have, that it represents a great advance if during the treatment the patient ventures to take up masturbation once more, though he may have no intention of making a permanent stop at that infantile halting place. In this connection I may remind you that a considerable number of precisely the most severe sufferers from neurosis have avoided all recollection of masturbation during historical times, while psychoanalysis is able to prove that that species of sexual activity had by no means been strange to them during the forgotten earliest period of their lives.

But I think the time has come to break off. For we are all agreed on one thing – that the subject of masturbation is quite inexhaustible.[2]

1 [Cf. Section C of Freud's paper on hysterical attacks (1909*a*), *RSE*, **9**, 203 f.]

2 [In a letter to Fliess of December 22, 1897 (Freud, 1950*a*, Letter 79), Freud described masturbation as the 'primal addiction', for which later addictions (to alcohol, tobacco, morphine, etc.) are substitutes. In the course of a fairly long passage on masturbation in the paper on 'Sexuality in the Aetiology of the Neuroses' (1898*a*), written soon after this letter, Freud compared it to other addictions (*RSE*, **3**, 270). He took up this idea very much later, in the discussion of gambling in his paper on Dostoevsky (1928*b*), ibid., **21**, 177.]

A NOTE ON THE UNCONSCIOUS IN PSYCHO-ANALYSIS

(1912)

In 1912 Freud was invited by the Society for Psychical Research of London to contribute to a 'Special Medical Part' of its *Proceedings*, and the present paper was the result. It was written by Freud in English, but was revised, it seems, in England before its publication in November, 1912. A German version of the paper appeared in the March, 1913, issue of the *Zeitschrift*. There was nothing on the face of it to show that this was not also written by Freud himself. But we learn from Jones (1955, 352) that it was, in fact, a translation of Freud's English paper made by one of his chief followers, Hanns Sachs. Lastly, it must be added that, when the paper was reprinted in Volume IV of the *Collected Papers* in 1925, it was subjected to a further slight 'secondary revision' which brought the terminology up to date.

As a result of all this we are left without any completely reliable text of the paper. No doubt both the revision and the translation were excellently carried out; and probably Freud himself went through both of them. Nevertheless, we must necessar- [258]
ily remain in uncertainty where there is a question of Freud's precise choice of terms. To take an example of one difficulty. The term 'conception' is used repeatedly in paragraphs 2 to 5. We should be inclined to suppose that Freud had in mind the

German word '*Vorstellung*' which is usually rendered in this edition by the English 'idea'. And, in fact, '*Vorstellung*' is the word used in the corresponding places in the German translation. At the end of the seventh paragraph and in the eighth the word 'idea' appears in the English text, and the corresponding word in the German is '*Idee*'. But in the tenth and eleventh paragraphs, where we once more find the English 'idea', the German rendering is almost everywhere '*Gedanke*' (which we usually translate 'thought'), but in one place '*Vorstellung*'. (Cf. *RSE*, **24**, 94–8.)

In the circumstances we have thought the wisest course is simply to reprint the original English version, exactly as it appeared in the original SPR *Proceedings*, with occasional footnotes where the terminology calls for comment.

Our reason for regretting this textual uncertainty will be understood when it is remembered that this is among the most important of Freud's theoretical papers. Here for the first time he gave a long and reasoned account of the grounds for his hypothesis of unconscious mental processes and set out the various ways in which he used the term 'unconscious'. The paper is in fact a study for the major work on the same subject which he was to write some three years later (1915*e*), *RSE*, **14**. Like the earlier paper 'On the Two Principles of Mental Functioning' (1911*b*) and Section III of the Schreber analysis (1911*c*), the present one is evidence of Freud's renewed concern with psychological theory.

The discussion of the ambiguities inherent in the word 'unconscious' is of particular interest, with the distinction between its three uses – the 'descriptive', the 'dynamic' and the 'systematic'. The present account is both more elaborate and clearer than the much shorter one given in Section II of the great paper (ibid., **14**, 152 f.). For there only two uses are differentiated, the 'descriptive' and the 'systematic'; and no plain distinction appears to be made between the latter and the 'dynamic' – the term which in the present paper is applied to the *repressed*
[259] unconscious. In two later discussions of the same topic, in Chapter I of *The Ego and the Id* (1923*b*), ibid., **19**, and in Lecture XXXI of the *New Introductory Lectures* (1933*a*), ibid., **22**, Freud returned to the triple distinction made here; and the third use of the term, the 'systematic' (touched upon only slightly at the end of the present paper), was then seen to be a step towards the structural division of the mind into 'id', 'ego' and 'superego', which was so greatly to clarify the whole situation.

A NOTE ON THE UNCONSCIOUS IN PSYCHO-ANALYSIS

I wish to expound in a few words and as plainly as possible what the [260]
term 'unconscious' has come to mean in Psycho-analysis and in Psycho-analysis alone.

A conception – or any other psychical[1] element – which is now *present* to my consciousness may become *absent* the next moment, and may become *present again*, after an interval, unchanged, and, as we say, from memory, not as a result of a fresh perception by our senses. It is this fact which we are accustomed to account for by the supposition that during the interval the conception has been present in our mind, although *latent* in consciousness. In what shape it may have existed while present in the mind and latent in consciousness we have no means of guessing.

At this very point we may be prepared to meet with the philosophical objection that the latent conception did not exist as an object of psychology, but as a physical disposition for the recurrence of the same psychical phenomenon, i.e. of the said conception. But we may reply that this is a theory far overstepping the domain of psychology proper; that it simply begs the question by asserting 'conscious' to be an identical term with 'psychical', and that it is clearly at fault in denying psychology the right to account for its most common facts, such as memory, by its own means.

Now let us call 'conscious' the conception which is present to our consciousness and of which we are aware, and let this be the only meaning of the term 'conscious'. As for latent conceptions, if we have any reason to suppose that they exist in the mind – as we had in the case of memory – let them be denoted by the term 'unconscious'.

Thus an unconscious conception is one of which we are not aware, but the existence of which we are nevertheless ready to admit on account of other proofs or signs.

This might be considered an uninteresting piece of descriptive or classificatory work if no experience appealed to our judgement other [261]

1 [In the 1925 English version, throughout the paper, 'psychical' was altered to 'mental'.]

than the facts of memory, or the cases of association by unconscious links. The well-known experiment, however, of the 'post-hypnotic suggestion' teaches us to insist upon the importance of the distinction between *conscious* and *unconscious* and seems to increase its value.

In this experiment, as performed by Bernheim, a person is put into a hypnotic state and is subsequently aroused. While he was in the hypnotic state, under the influence of the physician, he was ordered to execute a certain action at a certain fixed moment after his awakening, say half an hour later. He awakes, and seems fully conscious and in his ordinary condition; he has no recollection of his hypnotic state, and yet at the prearranged moment there rushes into his mind the impulse to do such and such a thing, and he does it consciously, though not knowing why. It seems impossible to give any other description of the phenomenon than to say that the order had been present in the mind of the person *in a condition of latency*, or had been *present unconsciously*, until the given moment came, and then had become conscious. But not the whole of it emerged into consciousness: only the conception of the act to be executed. All the other ideas associated with this conception – the order, the influence of the physician, the recollection of the hypnotic state, remained unconscious even then.

But we have more to learn from such an experiment. We are led from the purely descriptive to a *dynamic* view of the phenomenon. The idea of the action ordered in hypnosis not only became an object of consciousness at a certain moment, but the more striking aspect of the fact is that this idea grew *active*: it was translated into action as soon as consciousness became aware of its presence. The real stimulus to the action being the order of the physician, it is hard not to concede that the idea of the physician's order became active too. Yet this last idea did not reveal itself to consciousness, as did its outcome, the idea of the action; it remained unconscious, and so it was *active and unconscious* at the same time.

A post-hypnotic suggestion is a laboratory production, an artificial fact. But if we adopt the theory of hysterical phenomena first put forward by P. Janet and elaborated by Breuer and myself, we shall not be at a loss for plenty of natural facts showing the psychological character of the post-hypnotic suggestion even more clearly and distinctly.

[262] The mind of the hysterical patient is full of active yet unconscious ideas; all her symptoms proceed from such ideas. It is in fact the most striking character of the hysterical mind to be ruled by them. If the hysterical woman vomits, she may do so from the idea of being pregnant.

She has, however, no knowledge of this idea, although it can easily be detected in her mind, and made conscious to her, by one of the technical procedures of psycho-analysis. If she is executing the jerks and movements constituting her 'fit', she does not even consciously represent to herself the intended actions, and she may perceive those actions with the detached feelings of an onlooker. Nevertheless analysis will show that she was acting her part in the dramatic reproduction of some incident in her life, the memory of which was unconsciously active during the attack. The same preponderance of active unconscious ideas is revealed by analysis as the essential fact in the psychology of all other forms of neurosis.

We learn therefore by the analysis of neurotic phenomena that a latent or unconscious idea is not necessarily a weak one, and that the presence of such an idea in the mind admits of indirect proofs of the most cogent kind, which are equivalent to the direct proof furnished by consciousness. We feel justified in making our classification agree with this addition to our knowledge by introducing a fundamental distinction between different kinds of latent or unconscious ideas. We were accustomed to think that every latent idea was so because it was weak and that it grew conscious as soon as it became strong. We have now gained the conviction that there are some latent ideas which do not penetrate into consciousness, however strong they may have become. Therefore we may call the latent ideas of the first type *foreconscious*,[1] while we reserve the term *unconscious* (proper) for the latter type which we came to study in the neuroses. The term *unconscious*, which was used in the purely descriptive sense before, now comes to imply something more. It designates not only latent ideas in general, but especially ideas with a certain dynamic character, ideas keeping apart from consciousness in spite of their intensity and activity.

Before continuing my exposition I will refer to two objections which [263]
are likely to be raised at this point. The first of these may be stated thus: instead of subscribing to the hypothesis of unconscious ideas of which we know nothing, we had better assume that consciousness can be split up, so that certain ideas or other psychical acts may constitute a consciousness apart, which has become detached and estranged from the bulk of conscious psychical activity. Well-known pathological cases like

1 [In the 1925 English version, throughout the paper, 'foreconscious' was altered to 'preconscious', which has, of course, become the regular translation of the German '*vorbewusst*'.]

that of Dr. Azam[1] seem to go far to show that the splitting up of consciousness is no fanciful imagination.

I venture to urge against this theory that it is a gratuitous assumption, based on the abuse of the word 'conscious'. We have no right to extend the meaning of this word so far as to make it include a consciousness of which its owner himself is not aware. If philosophers find difficulty in accepting the existence of unconscious ideas, the existence of an unconscious consciousness seems to me even more objectionable. The cases described as splitting of consciousness, like Dr Azam's, might better be denoted as shifting of consciousness, – that function – or whatever it be – oscillating between two different psychical complexes which become conscious and unconscious in alternation.

The other objection that may probably be raised would be that we apply to normal psychology conclusions which are drawn chiefly from the study of pathological conditions. We are enabled to answer it by another fact, the knowledge of which we owe to psycho-analysis. Certain deficiencies of function of most frequent occurrence among healthy people, e.g. *lapsus linguae*, errors in memory and speech, forgetting of names, etc., may easily be shown to depend on the action of strong unconscious ideas in the same way as neurotic symptoms. We shall meet with another still more convincing argument at a later stage of this discussion.

By the differentiation of foreconscious and unconscious ideas, we are led on to leave the field of classification and to form an opinion about functional and dynamical relations in psychical action. We have found a *foreconscious activity* passing into consciousness with no difficulty, and an *unconscious activity* which remains so and seems to be cut off from consciousness.

Now we do not know whether these two modes of psychical activity are identical or essentially divergent from their beginning, but we may
[264] ask why they should become different in the course of psychical action. To this last question psycho-analysis gives a clear and unhesitating answer. It is by no means impossible for the product of unconscious activity to pierce into consciousness, but a certain amount of exertion is needed for this task. When we try to do it in ourselves, we become aware of a distinct feeling of *repulsion*[2] which must be overcome, and when we

1 [The reference is to the case of Félida X., a striking example of alternating or double personality, probably the first of its kind to be investigated and recorded in detail. (See Azam, 1876, and his later book, 1887.)]

2 [In the German translation the word 'repulsion', here and lower down, is rendered by '*Abwehr*', of which the usual English version is 'defence' or 'fending off'.]

produce it in a patient we get the most unquestionable signs of what we call his *resistance* to it. So we learn that the unconscious idea is excluded from consciousness by living forces which oppose themselves to its reception, while they do not object to other ideas, the foreconscious ones. Psycho-analysis leaves no room for doubt that the repulsion from unconscious ideas is only provoked by the tendencies embodied in their contents. The next and most probable theory which can be formulated at this stage of our knowledge is the following. Unconsciousness is a regular and inevitable phase in the processes constituting our psychical activity; every psychical act begins as an unconscious one, and it may either remain so or go on developing into consciousness, according as it meets with resistance or not. The distinction between foreconscious and unconscious activity is not a primary one, but comes to be established after repulsion has sprung up. Only then the difference between foreconscious ideas, which can appear in consciousness and reappear at any moment, and unconscious ideas which cannot do so gains a theoretical as well as a practical value. A rough but not inadequate analogy to this supposed relation of conscious to unconscious activity might be drawn from the field of ordinary photography. The first stage of the photograph is the 'negative'; every photographic picture has to pass through the 'negative process', and some of these negatives which have held good in examination are admitted to the 'positive process' ending in the picture.

But the distinction between foreconscious and unconscious activity, and the recognition of the barrier which keeps them asunder, is not the last or the most important result of the psycho-analytic investigation of psychical life. There is one psychical product to be met with in the most normal persons, which yet presents a very striking analogy to the wildest productions of insanity, and was no more intelligible to philosophers [265] than insanity itself. I refer to dreams. Psycho-analysis is founded upon the analysis of dreams; the interpretation of dreams is the most complete piece of work the young science has done up to the present. One of the most common types of dream-formation may be described as follows: a train of thoughts has been aroused by the working of the mind in the daytime, and retained some of its activity, escaping from the general inhibition of interests which introduces sleep and constitutes the psychical preparation for sleeping. During the night this train of thoughts succeeds in finding connections with one of the unconscious tendencies present ever since his childhood in the mind of the dreamer, but ordinarily *repressed* and excluded from his conscious life. By the borrowed force

of this unconscious help, the thoughts, the residue of the day's work,[1] now become active again, and emerge into consciousness in the shape of the dream. Now three things have happened:

(1) The thoughts have undergone a change, a disguise and a distortion, which represents the part of the unconscious helpmate.

(2) The thoughts have occupied consciousness at a time when they ought not.

(3) Some part of the unconscious, which could not otherwise have done so, has emerged into consciousness.

We have learnt the art of finding out the 'residual thoughts', the *latent thoughts of the dream*,[2] and, by comparing them with the apparent[3] *dream*, we are able to form a judgement on the changes they underwent and the manner in which these were brought about.

The latent thoughts of the dream differ in no respect from the products of our regular conscious activity; they deserve the name of foreconscious thoughts, and may indeed have been conscious at some moment of waking life. But by entering into connection with the unconscious tendencies during the night they have become assimilated to the latter, degraded as it were to the condition of unconscious thoughts, and subjected to the laws by which unconscious activity is governed. And
[266] here is the opportunity to learn what we could not have guessed from speculation, or from another source of empirical information – that the laws of unconscious activity differ widely from those of the conscious. We gather in detail what the peculiarities of the *Unconscious* are, and we may hope to learn still more about them by a profounder investigation of the processes of dream-formation.

This inquiry is not yet half finished, and an exposition of the results obtained hitherto is scarcely possible without entering into the most intricate problems of dream-analysis. But I would not break off this discussion without indicating the change and progress in our comprehension of the Unconscious which are due to our psycho-analytic study of dreams.

Unconsciousness seemed to us at first only an enigmatical characteristic of a definite psychical act. Now it means more for us. It is a sign that this act partakes of the nature of a certain psychical category known to

1 [In the 1925 English version the word 'mental' was inserted before 'work'.]

2 [In the German translation this clause is altered to 'Wir haben die Kunst gelernt, die "*Tagesreste*" und die *latenten Traumgedanken* herauszufinden'. The italicized German words are usually rendered 'day's residues' and 'latent dream thoughts' respectively.]

3 [This word was altered to 'manifest' (the conventional rendition of '*manifesten*') in the 1925 English version.]

us by other and more important characters[1] and that it belongs to a system of psychical activity which is deserving of our fullest attention. The index-value of the unconscious has far outgrown its importance as a property. The system revealed by the sign that the single acts forming parts of it are unconscious we designate by the name 'The Unconscious', for want of a better and less ambiguous term. In German, I propose to denote this system by the letters *Ubw*, an abbreviation of the German word 'Unbewusst'.[2] And this is the third and most significant sense which the term 'unconscious' has acquired in psycho-analysis.

1 [This was altered to 'features' in the 1925 English version.]

2 [The equivalent English abbreviation is, of course, '*Ucs*.'.]

AN EVIDENTIAL DREAM

1958 *SE*, **12**, 269–77. (Tr. J. Strachey, based on the 1924 translation.)

The present translation is a revised and corrected reprint of the *SE* version.

On its first appearance in the *Zeitschrift* (early in 1913) this paper was the first of several by various authors included under a general caption 'Beiträge zur Traumdeutung' ('Contributions to Dream Interpretation').

The paper presents the peculiarity of being a dream analysis at second hand. Apart from this, it is noteworthy for containing a remarkably clear account of the part played by the latent dream thoughts in the formation of dreams and for its insistence on the necessity for keeping in mind the distinction between the dream thoughts and the dream itself.

We know from Grubrich-Simitis (1993) that the patient who interpreted the dream reported in this paper is also credited with the explanation of some of the material discussed by Freud in 'Two Lies Told by Children' (1913*g*), p. 305 f. below, and for setting him on the track of the disposition to obsessional neurosis (cf. 1913*i*), p. 315 f. below. Her case history is discussed in 'Psychoanalysis and Telepathy' (1941*d*), *RSE*, **18**, 175 ff., and also briefly alluded to elsewhere (1925*i*), ibid., **19**, 125, and (1933*a*), ibid., **22**, 36 f.

AN EVIDENTIAL DREAM

[269]
Zwang

A lady suffering from doubting mania and obsessive ceremonials [*Zwangszeremoniell*][T] insisted that her nurses should never let her out of their sight for a single moment: otherwise she would begin to brood about forbidden actions that she might have committed while she was not being watched. One evening, while she was resting on the sofa, she thought she saw that the nurse on duty had fallen asleep. She called out: 'Did you see me?' The nurse started up and replied: 'Of course I did.' This gave the patient grounds for a fresh doubt, and after a time she repeated her question, which the nurse met with renewed protestations; just at that moment another attendant came in bringing the patient's supper.

This incident occurred one Friday evening. Next morning the nurse recounted a dream which had the effect of dispelling the patient's doubts.

DREAM. – *Someone had entrusted a child to her. Its mother had left home, and she* [the dreamer] *had lost it. As she went along, she enquired from the people in the street whether they had seen the child. Then she came to a large expanse of water and crossed a narrow footbridge.* (There was an addendum: *Suddenly there appeared before her on the footbridge, like a 'fata Morgana', the figure of another nurse.*) *Then she found herself in a familiar place, where she met a woman whom she had known as a girl and who had in those days been a saleswoman in a provision shop and later had got married. She asked the woman, who was standing in front of her door: 'Did you see the child?' The woman paid no attention to the question but informed her that she was now divorced from her husband, adding that marriage is not always happy either. She woke up feeling reassured and thought that the child would turn up all right in a neighbour's house.*

ANALYSIS. – The patient assumed that this dream referred to the falling asleep which the nurse had denied. From additional information volunteered by the latter, she was able to interpret the dream in a fashion which, although incomplete in some respects, was sufficient for all

practical purposes. I myself heard only the lady's report and did not interview the nurse. I shall first quote the patient's interpretation, and
[270] then supplement it with whatever our general understanding of the laws governing dream formation allows us to add.

'The nurse told me that the child in the dream reminded her of a case the nursing of which had given her the most lively satisfaction. It was that of a child who was unable to see on account of inflammation of the eyes (blennorrhoea). The mother, however, did not leave home: she helped to nurse the child. On the other hand, I remember too that when my husband, who thinks highly of this nurse, went away, he left me in her care and she promised to look after me as she would after a child.'

Furthermore, we know from the patient's analysis that by insisting on never being let out of sight she had put herself back in the position of being a child once more.

'Her having lost the child', continued the patient, 'signified that she had not seen me; she had lost sight of me. This was her admission that she had actually gone to sleep for a time and had not told me the truth afterwards.'

She was in the dark about the meaning of the small piece of the dream in which the nurse enquired from the people in the street whether they had seen the child; on the other hand, she was able to elucidate the later details of the manifest dream.

'The large expanse of water made the nurse think of the Rhine; she added, however, that it was much larger than the Rhine. Then she remembered that on the previous evening I had read her the story of Jonah and the whale, and had told her that I myself once saw a whale in the English Channel. I fancy that the large expanse of water was the sea and was an allusion to the story of Jonah.

'I think, too, the narrow footbridge came from the same story, which was amusingly written in dialect. The anecdote related how a religious instructor described to his pupils the wonderful adventures of Jonah; whereupon a boy objected that it could not be true, since the teacher himself had told them before that whales could swallow only the smallest creatures owing to the narrowness of their gullets. The teacher got out of the difficulty by saying that Jonah was a Jew, and that Jews would squeeze in anywhere. My nurse is very pious but inclined to religious doubts, and I reproached myself in case what I had read to her might have stirred them up.

'On this narrow footbridge she now saw the apparition of another
[271] nurse, whom she knew. She told me the story of this nurse: she had

drowned herself in the Rhine because she had been discharged from a case owing to something she had been guilty of.[1] She herself had feared, therefore, that she would be discharged for having fallen asleep. Moreover, on the day following the incident and after relating the dream, the nurse cried bitterly, and when I asked her why, replied quite rudely: "You know why as well as I do; and now you won't trust me any more!'"

Since the apparition of the drowned nurse was an addendum and an especially distinct one, we would have advised the lady to begin her dream interpretation at that point.[2] According to the dreamer's report, too, this first half of her dream was accompanied by acute anxiety; the second part paved the way for the feeling of reassurance with which she awoke.

'I regard the next part of the dream,' said the lady, continuing her analysis, 'as certain corroboration of my view that the dream had to do with what happened on Friday evening, for the person who had formerly been a saleswoman in a provision shop can only have referred to the attendant who brought in the supper on that occasion. I noticed, too, that the nurse had complained of nausea all day long. The question she put to this woman: "Did you see the child?" is obviously traceable to my question: "Did you see me?" which I had put to her for the second time just as the attendant came in with the dishes.'

In the dream, too, enquiry after the child was made on two occasions. [272]
The fact that the woman did not reply – paid no attention – we may regard as a depreciation of this other attendant made in the dreamer's favour: she represented herself in the dream as being superior to the other woman, precisely because she herself had to face reproaches on account of her own lack of attention.

'The woman who appeared in the dream was not in actual fact divorced from her husband. The situation was taken from an incident in the life of the other attendant, who had been separated – "divorced" – from a man by her parents' command. The remark that "marriage does

1 At this point I have been guilty of making a condensation [*Verdichtung*]^{T} of the material, which I have been able to put right after going through my draft with the lady who told me the story. The nurse who met the dreamer as an apparition on the footbridge had not been guilty of anything in her nursing. She was discharged because the child's mother, who had to leave home at the time, wanted to leave her child in the charge of an older attendant – thus in point of fact a more trustworthy one. This was followed by a second story about another nurse who had actually been discharged on account of neglect, but who did not on that account drown herself. The material necessary for the interpretation [*Deutung*]^{T} of the dream element came, as is so often the way, from two sources. My memory carried out the synthesis that led to the interpretation. For the rest, this story of the drowned nurse contains the factor of the mother leaving home, which the lady connected with the departure of her husband. We thus have here an overdetermination which detracts somewhat from the elegance of the interpretation.

2 [See *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 463.]

not always run smoothly either" was probably a consolation used in the course of conversation between the two women. This consolation prefigured another, with which the dream ended: "The child will turn up all right."

'I concluded from this dream that on the evening in question the nurse really did fall asleep and that she was afraid of being dismissed on that account. Because of this I no longer felt any doubt about the correctness of my observation. Incidentally, after relating the dream, she added that she was very sorry she had not got a dream book with her. To my comment that such books were full of the most ignorant superstitions, she replied that, although she was not at all superstitious, still all the unpleasant happenings of her life had taken place on a Friday. I must add that at the present time her treatment of me is not at all satisfactory, and she is touchy and irritable and makes scenes about nothing.'

I think we must credit the lady with having correctly interpreted and evaluated her nurse's dream. As so often happens with dream interpretation during analysis, the translation [*Übersetzung*]^{T} of the dream does not depend solely on the products of association [*Assoziation*]^{T}, but we have also to take into account the circumstances of its narration, the behaviour of the dreamer before and after the analysis of the dream,[1] as well as every remark or disclosure made by the dreamer at about the same time – during the same analytic session. If we take into consideration the nurse's touchiness, her attitude to unlucky Fridays, etc., we shall confirm the conclusion that the dream contained an admission that,
[273] in spite of her denial, she had actually dozed off, and was afraid she would be sent away from the 'child' in her care.[2]

While, however, for the lady who reported it to me this dream had practical significance, for us it stimulates theoretical interest in two directions. It is true that it ended in a consolation, but in the main it represented an important *admission* in regard to the nurse's relation to her patient. How does it come about that a dream, which is supposed, after all, to serve as the fulfilment of a wish, could take the place of an admission which was not even of any advantage to the dreamer? Must we really concede that, in addition to wishful (and anxiety [*Angst*]^{T}) dreams, there are also dreams of admission, as well as of warning, reflection, adaptation, and so on?

I must confess that I still do not quite understand why the stand I took

1 [Cf., for an extreme instance (1920*a*), *RSE*, **18**, 155.]

2 A few days later, indeed, the nurse confessed to a third person that she had fallen asleep that evening, and thus confirmed the lady's interpretation.

against any such temptation in my *Interpretation of Dreams* has given rise to misgivings in the minds of so many psychoanalysts, among them some well-known ones. It seems to me that the differentiation between dreams of wishing, admission, warning, adaptation, and so on, has not much more sense than the differentiation, which is accepted perforce, of medical specialists into gynaecologists, paediatricians and dentists. Let me recapitulate here as briefly as possible what I have said on this question in my *Interpretation of Dreams*.[1]

The so-called 'day's residues' can act as disturbers of sleep and constructors of dreams; they are affectively cathected thought processes from the dream day, which have resisted the general lowering [of energy] through sleep. These day's residues are uncovered by tracing back the manifest dream to the latent dream thoughts; they constitute portions of the latter and are thus among the activities of waking life – whether conscious or unconscious[2] – which have been able to persist into the period of sleep. In accordance with the multiplicity of thought processes in the conscious and preconscious, these day's residues have the most numerous and varied meanings: they may be wishes or fears that have not been disposed of, or intentions, reflections, warnings, attempts at [274]
adaptation to current tasks, and so on. To this extent the classification of dreams that is under consideration seems to be justified by the content which is uncovered by interpretation. These day's residues, however, are not the dream itself: they lack the main essential of a dream. Of themselves they are not able to construct a dream. They are, strictly speaking, only the psychical material for the dream-work, just as sensory and somatic stimuli, whether accidental or produced under experimental conditions, constitute the *somatic* material for the dream-work. To attribute to them the main part in the construction of dreams is simply to repeat at a new point the pre-analytic error which explained dreams by referring them to bad digestion or to pressure on the skin. Scientific errors, indeed, are tenacious of life, and even when they have been refuted are ready to creep in again under new disguises.

The present state of our knowledge leads us to conclude that the essential factor in the construction of dreams is an unconscious wish – as a rule an infantile wish, now repressed [*verdrängter*][T] – which can come *Verdrängung*
to expression in this somatic or psychical material (in the day's residues too, therefore) and can thus supply these with a[3] force which enables them to press their way through to consciousness even during the

1 *RSE*, **5**, 501–3.

2 [In the 1913 edition only, this read 'preconscious'.]

3 ['*eine*.' In 1913 only, '*seine*', 'its'.]

suspension of thought at night. The dream is in every case a fulfilment of *this* unconscious wish, whatever else it may contain – warning, reflection, admission, or any other part of the rich content of preconscious waking life that has persisted undealt with into the night. It is *this* unconscious wish that gives the dream-work its peculiar character as an unconscious revision of preconscious material. A psychoanalyst can characterize as dreams only the products of the dream-work: in spite of the fact that the latent dream thoughts are only arrived at from the interpretation of the dream, he cannot reckon them as part of the dream, but only as part of preconscious reflection.[I] (Secondary revision by the conscious agency is here reckoned as part of the dream-work. Even if one were to separate it, this would not involve any alteration in our
[275] conception [*Auffassung*][T]. We should then have to say: dreams in the analytic sense comprise the dream-work proper together with the secondary revision of its products.)[2] The conclusion to be drawn from these considerations is that one cannot put the wish-fulfilling character of dreams on a par with their character as warnings, admissions, attempts at solution, etc., without denying the concept of a psychical dimension of depth – that is to say, without denying the standpoint of psychoanalysis.[3]

Let us now go back to the nurse's dream, in order to demonstrate the quality of depth in the wish fulfilment contained in it. We already know that the lady's interpretation of the dream was by no means complete; there were portions of it to which she was unable to do justice. Moreover, she suffered from an obsessional neurosis, a condition which, from what I have observed, makes it considerably harder to understand dream symbols, just as dementia praecox makes it easier.[4]

Nevertheless, our knowledge of dream symbolism enables us to understand uninterpreted portions of this dream and to discover a deeper significance behind the interpretations already given. We cannot but notice that some of the material employed by the nurse came from

1 [The importance of distinguishing between dreams and latent dream thoughts was insisted upon by Freud in several places: e.g. in the 'History of the Psychoanalytic Movement' (1914*d*), *RSE*, **14**, 50 and 57, and in a footnote added in 1925 to *The Interpretation of Dreams*, ibid., **5**, 453 *n.* 2.]

2 [Freud often spoke of secondary revision as part of the dream-work (e.g. in *The Interpretation of Dreams*, ibid., **5**, 438 f.). But in an article on 'Psychoanalysis' contributed to Marcuse's *Handwörterbuch* (1923*a*) he stated categorically that 'strictly speaking' it 'does not form a part of the dream-work' (ibid., **18**, 235).]

3 [See the long discussion of this in Lecture XIV of the *Introductory Lectures* (1916–17*a*), ibid., **15**, 186 ff.]

4 [Cf. a remark on this point added in 1925 to *The Interpretation of Dreams* (1900*a*), Chapter VI, Section E; ibid., **5**, 313 f.]

the complex of giving birth, of having children. The expanse of water (the Rhine, the Channel where the whale was seen) was certainly the water out of which children come. And then, too, she came to the water in search of a child. The Jonah legend, which was a factor lying behind the determination of this water, the question how Jonah (the child) could get through such a narrow passage, belongs to the same complex. And the nurse who threw herself into the Rhine out of mortification found a sexual-symbolic consolation for her despair of life in the mode of her death – by going into water. The narrow footbridge on which the apparition met her was in all probability also a genital symbol, although [276]
I must admit that here we lack as yet more precise knowledge.[1]

The wish 'I want to have a child' seems therefore to have been the dream constructor from the unconscious; no other would have been better calculated to console the nurse for the distressing state of affairs in real life. 'I shall be discharged: I shall lose the child in my care. What does it matter? I shall get a real child of my own instead.' The uninterpreted portion of the dream in which she questioned everyone in the street about the child may perhaps belong here; the interpretation would then run: 'And even if I have to offer myself on the streets I know how to get a child for myself.' A strain of defiance in the dreamer, hitherto disguised, suddenly declares itself at this point. Her admission fits in here for the first time: 'I have shut my eyes and compromised my professional reputation for conscientiousness; now I shall lose my place. Shall I be such a fool as to drown myself like Nurse X? Not I: I'll give up nursing altogether and get married; I'll be a woman and have a real child; nothing shall prevent me.' This interpretation is justified by the consideration that 'having children' is really the infantile expression of a wish for sexual intercourse: indeed it can be chosen in consciousness as a euphemistic expression of this objectionable wish.

Thus the dreamer's disadvantageous admission, to which she showed some inclination even in waking life, was made possible in the dream by being employed by a latent character trait of hers [the 'strain of defiance'] for the purpose of bringing about the fulfilment of an infantile wish. We may surmise that this trait had a close connection – in regard both to time and to content – with the wish for a child and for sexual enjoyment.

Subsequent enquiry from the lady to whom I owe the first part of this interpretation afforded some unexpected information about the nurse's previous life. Before she took up nursing she had wanted to marry a man

1 [Several examples showing the symbolic connection between water and birth were added to *The Interpretation of Dreams* from 1909 onwards. See *RSE*, **5**, 357 ff. There is a short discussion of the symbolism of bridges towards the end of Lecture XXIX of the *New Introductory Lectures* (1933*a*), ibid., **22**, 22 f.]

who had been keenly interested in her; but she had abandoned the projected marriage on account of the opposition of an aunt, towards whom
[277] her relations were a curious mixture of dependence and defiance. This
Versagung aunt who prevented [*versagte*][T] the marriage was the Superior of a nursing Order. The dreamer always regarded her as her pattern. She had expectations of an inheritance from her and was tied to her for that reason. Nevertheless, she opposed her aunt by not entering the Order as that lady had planned. The defiance shown in the dream was therefore directed against the aunt. We have ascribed an anal-erotic origin to this character trait,[1] and may take into consideration that the interests which made her dependent on her aunt were of a financial nature; we are also reminded that children favour the anal theory of birth.[2]

This factor of infantile defiance may perhaps allow us to assume a closer relation between the first and last scenes in the dream. The former saleswoman in a provision shop represents in the dream the attendant who brought the lady's supper into the room just when she was asking the question 'Did you see me?' It appears, however, that she was cast for the role of hostile rival in general. The dreamer disparaged her capacities as a nurse by making her take not the slightest interest in the lost child, but deal only with her own private affairs in her answer. She had thus
Verschiebung displaced [*verschoben*][T] on to this figure the indifference about the child in her care which she was beginning to feel. The unhappy marriage and divorce which she herself must have dreaded in her most secret wishes were attributed to the other woman. We know, however, that it was the aunt who had separated the dreamer from her fiancé. Hence the 'provision saleswoman' (a figure not necessarily without an infantile symbolic significance) may represent the aunt-Superior, who was, in fact, not much older than the dreamer and who had played the traditional part of mother-rival in her life. A satisfactory confirmation of this interpretation is to be found in the fact that the 'familiar' place where she came upon this person standing in front of her door was precisely the place where her aunt resided as a Superior.

Owing to the lack of contact between the analyst and the person under analysis, it is scarcely advisable to penetrate deeper into the structure of the dream. But we may perhaps say that so far as it was accessible to interpretation it has provided us with plenty of confirmations as well as with plenty of new problems.

1 [See 'Character and Anal Erotism' (1908*b*), *RSE*, **9**, 149 ff.]

'The Occurrence in Dreams of Material from Fairy Tales'
1925 *CP*, **4**, 236–43. (Tr. James Strachey.)
1958 *SE*, **12**, 281–7. (Tr. James Strachey, slightly amended reprint of the 1925 version.)

The present translation is a revised and corrected reprint of the *SE* version.

The second of the two examples reported in this paper was derived from the analysis of the case of the 'Wolf Man', who was still under treatment with Freud at the time of its publication. The whole of this part of the paper was included verbatim in the case history, which was written in 1914 but only published four years later – 'From the History of an Infantile Neurosis' (1918*b*). The analysis of the dream is there carried much further (*RSE*, **17**, 26 ff.).

THE OCCURRENCE IN DREAMS OF MATERIAL FROM FAIRY TALES

It is not surprising to find that psychoanalysis confirms our recognition of the important place which folk fairy tales have acquired in the mental life [*Seelenleben*][T] of our children. In a few people a recollection of their favourite fairy tales takes the place of memories of their own childhood; they have made the fairy tales into screen memories [*Deckerinnerungen*][T]. [281]

Seele

Elements and situations derived from fairy tales are also frequently to be found in dreams. In interpreting the passages in question the patient will produce the significant fairy tale as an association [*fällt . . . ein*][T]. In the present paper I shall give two instances of this very common occurrence. But it will not be possible to do more than hint at the relations between the fairy tales and the history of the dreamer's childhood and his neurosis, though this limitation will involve the risk of breaking links which were of the utmost importance to the analyst.

Einfall

I

Here is a dream of a young married woman who had had a visit from her husband a few days before: *She was in a room that was entirely brown. A little door led to the top of a steep staircase, and up this staircase there came into the room a curious manikin – small, with white hair, a bald top to his head and a red nose. He danced round the room in front of her, carried on in the funniest way, and then went down the staircase again. He was dressed in a grey garment, through which every part of his figure was visible.* (A correction was made subsequently: *He was wearing a long black coat and grey trousers*.)

The analysis was as follows. The description of the manikin's personal appearance fitted the dreamer's father-in-law without any alteration being necessary.[1] Immediately afterwards, however, she thought of the

1 Except for the detail that the manikin had his hair cut short, whereas her father-in-law wore his long.

story of 'Rumpelstiltskin',[1] who danced around in the same funny way as the man in the dream and in so doing betrayed his name to the queen;
[282] but by that he lost his claim to the queen's first child, and in his fury tore himself in two.[2]

On the day before she had the dream she herself had been just as furious with her husband and had exclaimed: 'I could tear him in two.'

The brown room at first gave rise to difficulties. All that occurred to her was her parents' dining room, which was panelled in that colour – in brown wood. She then told some stories of beds which were so uncomfortable for two people to sleep in. A few days before, when the subject of conversation had been beds in other countries, she had said something very *mal à propos* – quite innocently, as she maintained – and everyone in the room had roared with laughter.

The dream was now already intelligible. The brown wood room[3] was in the first place a bed, and through the connection with the dining room it was a marriage bed.[4] She was therefore in her marriage bed. Her visitor should have been her young husband, who, after an absence of several months, had visited her to play his part in the double bed. But to begin with it was her husband's father, her father-in-law.

Behind this first interpretation [*Deutung*]^{T} we have a glimpse of deeper
Sex and purely sexual [*sexuellen*]^{T} material. Here the room was the vagina. (The room was in her – this was reversed in the dream.) The little man who made grimaces and behaved so funnily was the penis. The narrow door and the steep stairs confirmed the view that the situation was a representation of intercourse. As a rule we are accustomed to find the penis symbolized by a child; but we shall find there was good reason for a father being introduced to represent the penis in this instance.

The solution to the remaining portion of the dream will entirely confirm us in this interpretation. The dreamer herself explained the transparent grey garment as a condom. We may gather that considerations of preventing conception and worries whether this visit of her
[283] husband's might not have sown the seed of a second child were among the instigating causes of the dream.

The black coat. Coats of that kind suited her husband admirably. She wanted to persuade him always to wear them, instead of his usual

1 ['Rumpelstiltzchen.' Grimm, 1918, **1**, 250. (No. 55.)]

2 [This, the climax of the story, is usually suppressed or softened in English translations.]

3 Wood, as is well known, is frequently a female or maternal symbol: e.g. *materia*, *Madeira*, etc. [Cf. *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 317.]

4 For bed and board stand for marriage. [Cf. the law-Latin phrase for a legal separation: '*separatio a mensa et toro*' ('separation from table and bed').]

clothes. Dressed in the black coat, therefore, her husband was as she liked to see him. *The black coat and the grey trousers*. At two different levels, one above the other, this had the same meaning: 'I should like you to be dressed like that. I like you like that.'

Rumpelstiltskin was connected with the contemporary thoughts underlying the dream – the day's residues – by a neat antithetic relation. In the fairy tale he comes in order to take away the queen's first child. In the dream the little man comes in the shape of a father, because he had presumably brought a second child. But Rumpelstiltskin also gave access to the deeper, infantile stratum of the dream thoughts. The droll little fellow, whose very name is unknown, whose secret is so eagerly canvassed, who can perform such extraordinary tricks – in the fairy tale he turns straw into gold – the fury against him, or rather against his possessor, who is envied for possessing him (the girl's envy for the penis) – all of these were elements whose relation to the foundations of the patient's neurosis can, as I have said, barely be touched upon in this paper. The short-cut hair of the manikin in the dream was no doubt also connected with the subject of castration.

If we carefully observe from clear instances the way in which dreamers use fairy tales and the point at which they bring them in, we may perhaps also succeed in picking up some hints which will help in interpreting remaining obscurities in the fairy tales themselves.

II

A young man[1] told me the following dream. He had a chronological basis for his early memories in the circumstance that his parents moved from one country estate to another just before he was five years old; the dream, which he said was his earliest one, occurred while he was still upon the first estate.

'*I dreamt that it was night and that I was lying in my bed. (My bed stood with its foot towards the window: in front of the window there was a row* [284] *of old walnut trees. I know it was winter when I had the dream, and night-time.) Suddenly the window opened of its own accord, and I was terrified to see that some white wolves were sitting on the big walnut tree in front of the window. There were six or seven of them. The wolves were quite white, and looked more like foxes or sheep-dogs, for they had big tails like foxes and they had their ears pricked like dogs when they pay attention to something. In great terror, evidently of being eaten up by the wolves,*

1 [The 'Wolf Man'. See Editors' Note, p. 277 above.]

I screamed and woke up. My nurse hurried to my bed, to see what had happened to me. It took quite a long while before I was convinced that it had only been a dream; I had had such a clear and life-like picture of the window opening and the wolves sitting on the tree. At last I grew quieter, felt as though I had escaped from some danger, and went to sleep again.

'The only piece of action in the dream was the opening of the window; for the wolves sat quite still and without making any movement on the branches of the tree, to the right and left of the trunk, and looked at me. It seemed as though they had riveted their whole attention upon me. – I think this was my first anxiety dream. I was three, four, or at most five years old at the time. From then until my eleventh or twelfth year I was always afraid of seeing something terrible in my dreams.'

He added a drawing of the tree with the wolves, which confirmed his description.[1] The analysis of the dream brought the following material to light.

He had always connected this dream with the recollection that during these years of his childhood he was most tremendously afraid [*Angst*] of the picture of a wolf in a book of fairy tales. His elder sister, who was very much his superior, used to tease him by holding up this particular picture in front of him on some excuse or other, so that he was terrified and began to scream. In this picture the wolf was standing upright, striding out with one foot, with its claws stretched out and its ears pricked. He thought this picture must have been an illustration to the story of 'Little Red Riding-Hood'.[2]

Why were the wolves white? This made him think of the sheep, large flocks of which were kept in the neighbourhood of the estate. His father occasionally took him with him to visit these flocks, and every time this
[285] happened he felt very proud and blissful. Later on – according to enquiries that were made it may easily have been shortly before the time of the dream – an epidemic broke out among the sheep. His father sent for a follower of Pasteur's, who inoculated the animals, but after the inoculation even more of them died than before.

How did the wolves come to be on the tree? This reminded him of a story that he had heard his grandfather tell. He could not remember whether it was before or after the dream, but its subject is a decisive argument in favour of the former view. The story ran as follows. A tailor was sitting at work in his room, when the window opened and a wolf leapt in. The tailor hit after him with his yard – no (he corrected himself),

1 [This drawing is reproduced in *RSE*, **17**, 27.]

2 ['Rotkäpchen.' Grimm, 1918, **1**, 125. (No. 26.)]

caught him by his tail and pulled it off, so that the wolf ran away in terror. Some time later the tailor went into the forest, and suddenly saw a pack of wolves coming towards him; so he climbed up a tree to escape from them. At first the wolves were in perplexity; but the maimed one, which was among them and wanted to revenge himself on the tailor, proposed that they should climb one upon another till the last one could reach him. He himself – he was a vigorous old fellow – would be the base of the pyramid. The wolves did as he suggested, but the tailor had recognized the visitor whom he had punished, and suddenly called out as he had before: 'Catch the grey one by his tail!' The tailless wolf, terrified by the recollection, ran away, and all the others tumbled down.

In this story the tree appears, upon which the wolves were sitting in the dream. But it also contains an unmistakable allusion to the castration complex. The *old* wolf was docked of his tail by the tailor. The fox tails of the wolves in the dream were probably compensations for this taillessness.

Why were there six or seven wolves? There seemed to be no answer to this question, until I raised a doubt whether the picture that had frightened him could be connected with the story of 'Little Red Riding-Hood'. This fairy tale offers an opportunity for only two illustrations – Little Red Riding-Hood's meeting with the wolf in the wood, and the scene in which the wolf lies in bed in the grandmother's night-cap. There must therefore be some other fairy tale behind his recollection of the picture. He soon discovered that it could only be the story of 'The Wolf and the Seven Little Goats'.[1] Here the number seven occurs, and also the number [286]
six, for the wolf ate up only six of the little goats, while the seventh hid itself in the clock-case. The white, too, comes into this story, for the wolf had his paw made white at the baker's after the little goats had recognized him on his first visit by his grey paw. Moreover, the two fairy tales have much in common. In both there is the eating up, the cutting open of the belly, the taking out of the people who have been eaten and their replacement by heavy stones, and finally in both of them the wicked wolf perishes. Besides all this, in the story of the little goats the tree appears. The wolf lay down under a tree after his meal and snored.

I shall have, for a special reason, to deal with this dream again elsewhere, and interpret it and consider its significance in greater detail. For it is the earliest anxiety dream that the dreamer remembered from his childhood, and its content, taken in connection with other dreams that followed it soon afterwards and with certain events in his earliest years,

1 ['Der Wolf und die sieben Geisslein.' Grimm, 1918, **1**, 23. (No. 5.)]

is of quite peculiar interest. We must confine ourselves here to the relation of the dream to the two fairy tales which have so much in common with each other, 'Little Red Riding-Hood' and 'The Wolf and the Seven Little Goats'. The effect produced by these stories was shown in the little dreamer by a regular animal phobia. This phobia was only distinguished from other similar cases by the fact that the anxiety-animal was not an object easily accessible to observation (such as a horse or a dog), but was known to him only from stories and picture-books.

I shall discuss on another occasion the explanation of these animal phobias and the significance attaching to them.[1] I will only remark in anticipation that this explanation is in complete harmony with the principal characteristic shown by the neurosis from which the present dreamer suffered later in his life. His fear of his father was the strongest motive [*Motiv*][T] for his falling ill, and his ambivalent attitude towards every father surrogate was the dominating feature of his life as well as of his behaviour during the treatment.

If in my patient's case the wolf was merely a first father surrogate, the question arises whether the hidden content in the fairy tales of the wolf that ate up the little goats and of 'Little Red Riding-Hood' may not
[287] simply be infantile fear of the father.[2] Moreover, my patient's father had the characteristic, shown by so many people in relation to their children, of indulging in 'affectionate abuse'; and it is possible that during the patient's earlier years his father (though he grew severe later on) may more than once, as he caressed the little boy or played with him, have threatened in fun to 'gobble him up'. One of my patients told me that her two children could never get to be fond of their grandfather, because in the course of his affectionate romping with them he used to frighten them by saying he would cut open their tummies.

1 [This discussion can be found in the 'Wolf Man' case history (1918*b*), *RSE*, **17**, 88 f.]

2 Compare the similarity between these two fairy tales and the myth of Kronos, which has been pointed out by Rank (1912*a*).

THE THEME OF THE THREE CASKETS

Freud's correspondence (quoted in Jones, 1955, 405) shows that the underlying idea of this paper occurred to him in June, 1912, though the work was only published a year later. In a letter to Ferenczi of July 7, 1913, he connected the 'subjective determinant' of the paper with his own three daughters (Freud, 1960*a*).

THE THEME OF THE THREE CASKETS

I

Two scenes from Shakespeare, one from a comedy and the other from a tragedy, have lately given me occasion for posing and solving a small problem. [291]

The first of these scenes is the suitors' choice between the three caskets in *The Merchant of Venice*. The fair and wise Portia is bound at her father's bidding to take as her husband only that one of her suitors who chooses the right casket from among the three before him. The three caskets are of gold, silver and lead: the right casket is the one that contains her portrait. Two suitors have already departed unsuccessful: they have chosen gold and silver. Bassanio, the third, decides in favour of lead; thereby he wins the bride, whose affection was already his before the trial of fortune. Each of the suitors gives reasons for his choice in a speech in which he praises the metal he prefers and depreciates the other two. The most difficult task thus falls to the share of the fortunate third suitor; what he finds to say in glorification of lead as against gold and silver is little and has a forced ring. If in psychoanalytic practice we were confronted with such a speech, we should suspect that there were concealed motives behind the unsatisfying reasons produced.

Shakespeare did not himself invent this oracle of the choice of a casket; he took it from a tale in the *Gesta Romanorum*,[1] in which a girl has to make the same choice to win the emperor's son.[2] Here too the third metal, lead, is the bringer of fortune. It is not hard to guess that we have here an ancient theme, which needs to be interpreted, accounted for and traced back to its origin. A first conjecture as to the meaning of this choice between gold, silver and lead is quickly confirmed by a statement of Stucken's,[3] who has made a study of the same material over a wide

1 [A mediaeval collection of stories of unknown authorship.]

2 Brandes (1896).

3 Stucken (1907, 655).

field. He writes: 'The identity of Portia's three suitors is clear from their
[292] choice: the Prince of Morocco chooses the gold casket – he is the sun; the Prince of Arragon chooses the silver casket – he is the moon; Bassanio chooses the leaden casket – he is the star youth.' In support of this explanation he cites an episode from the Estonian folk epic 'Kalewipoeg', in which the three suitors appear undisguisedly as the sun, moon and star youths (the last being 'the Pole star's eldest boy') and once again the bride falls to the lot of the third.

Thus our little problem has led us to an astral myth! The only pity is that with this explanation we are not at the end of the matter. The question is not exhausted, for we do not share the belief of some investigators that myths were read in the heavens and brought down to earth; we are more inclined to judge with Otto Rank[1] that they were projected on to the heavens after having arisen elsewhere under purely human conditions. It is in this human content that our interest lies.

Let us look once more at our material. In the Estonian epic, just as in the tale from the *Gesta Romanorum*, the subject is a girl choosing between three suitors; in the scene from *The Merchant of Venice* the subject is apparently the same, but at the same time something appears in it that is in the nature of an inversion of the theme: a *man* chooses between three – caskets. If what we were concerned with were a dream, it would occur to us at once that caskets are also women, symbols of what is essential in woman, and therefore of a woman herself – like coffers, boxes, cases, baskets, and so on.[2] If we boldly assume that there are symbolic substitutions of the same kind in myths as well, then the casket scene in *The Merchant of Venice* really becomes the inversion we suspected. With a wave of the wand, as though we were in a fairy tale, we have stripped the astral garment from our theme; and now we see that the theme is a human one, *a man's choice between three women*.

This same content, however, is to be found in another scene of Shakespeare's, in one of his most powerfully moving dramas; not the choice of a bride this time, yet linked by many hidden similarities to the choice of the casket in *The Merchant of Venice*. The old King Lear resolves to divide his kingdom while he is still alive among his three daughters, in proportion to the amount of love that each of them expresses for him. The two elder ones, Goneril and Regan, exhaust
[293] themselves in asseverations and laudations of their love for him; the third, Cordelia, refuses to do so. He should have recognized the

1 Rank (1909, 8 ff.).

2 [See *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 316.]

unassuming, speechless love of his third daughter and rewarded it, but he does not recognize it. He disowns Cordelia, and divides the kingdom between the other two, to his own and the general ruin. Is not this once more the scene of a choice between three women, of whom the youngest is the best, the most excellent one?

There will at once occur to us other scenes from myths, fairy tales and literature, with the same situation as their content. The shepherd Paris has to choose between three goddesses, of whom he declares the third to be the most beautiful. Cinderella, again, is a youngest daughter, who is preferred by the prince to her two elder sisters. Psyche, in Apuleius's story, is the youngest and fairest of three sisters. Psyche is, on the one hand, revered as Aphrodite in human form; on the other, she is treated by that goddess as Cinderella was treated by her stepmother and is set the task of sorting a heap of mixed seeds, which she accomplishes with the help of small creatures (doves in the case of Cinderella, ants in the case of Psyche).[1] Anyone who cared to make a wider survey of the material would undoubtedly discover other versions of the same theme preserving the same essential features.

Let us be content with Cordelia, Aphrodite, Cinderella and Psyche. In all the stories the three women, of whom the third is the most excellent one, must surely be regarded as in some way alike if they are portrayed as sisters. (We must not be led astray by the fact that Lear's choice is between three *daughters*; this may mean nothing more than that he has to be represented as an old man. An old man cannot very well choose between three women in any other way. Thus they become his daughters.)

But who are these three sisters and why must the choice fall on the third? If we could answer this question, we should be in possession of the interpretation [*Deutung*][T] we are seeking. We have once already made use of an application of psychoanalytic technique, when we explained the three caskets symbolically as three women. If we have the courage to proceed in the same way, we shall be setting foot on a path which will [294] lead us first to something unexpected and incomprehensible, but which will perhaps, by a devious route, bring us to a goal.

It must strike us that this excellent third woman has in several instances certain peculiar qualities besides her beauty. They are qualities that seem to be tending towards some kind of unity; we must certainly not expect to find them equally well marked in every example. Cordelia makes

1 I have to thank Dr Otto Rank for calling my attention to these similarities. [Cf. a reference to this in Chapter XII of *Group Psychology* (1921c), *RSE*, **18**, 127.]

herself unrecognizable, inconspicuous like lead, she remains dumb, she 'loves and is silent'.[1] Cinderella hides so that she cannot be found. We may perhaps be allowed to equate concealment and dumbness. These would of course be only two instances out of the five we have picked out. But there is an intimation of the same thing to be found, curiously enough, in two other cases. We have decided to compare Cordelia, with her obstinate refusal, to lead. In Bassanio's short speech while he is choosing the casket, he says of lead (without in any way leading up to the remark):

> 'Thy paleness[2] moves me more than eloquence.'

That is to say: 'Thy plainness moves me more than the blatant nature of the other two.' Gold and silver are 'loud'; lead is dumb – in fact like Cordelia, who 'loves and is silent'.[3]

In the ancient Greek accounts of the Judgement of Paris, nothing is said of any such reticence on the part of Aphrodite. Each of the three goddesses speaks to the youth and tries to win him by promises. But, oddly enough, in a quite modern handling of the same scene this characteristic of the third one which has struck us makes its appearance again. In the libretto of Offenbach's *La belle Hélène*, Paris, after telling of the solicitations of the other two goddesses, describes Aphrodite's behaviour in this competition for the beauty prize:

> La troisième, ah! la troisième . . .
> La troisième ne dit rien.
> Elle eut le prix tout de même . . .[4]

[295] If we decide to regard the peculiarities of our 'third one' as concentrated in her 'dumbness', then psychoanalysis will tell us that in dreams dumbness is a common representation of death.[5]

More than ten years ago a highly intelligent man told me a dream which he wanted to use as evidence of the telepathic nature of dreams. In it he saw an absent friend from whom he had received no news for a

1 [From an aside of Cordelia's, Act I, Scene 1.]

2 'Plainness' according to another reading.

3 In Schlegel's translation this allusion is quite lost; indeed, it is given the opposite meaning: 'Dein schlichtes Wesen spricht beredt mich an.' ['Thy plainness speaks to me with eloquence.']

4 [Literally: 'The third one, ah! the third one . . . the third one said nothing. She won the prize all the same.' – The quotation is from Act I, Scene 7, of Meilhac and Halévy's libretto. In the German version used by Freud 'the third one' '*blieb stumm*' – 'remained dumb'.]

5 In Stekel's *Sprache des Traumes*, too, dumbness is mentioned among the 'death' symbols (1911*a*, 351). [Cf. *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 319.]

very long time, and reproached him energetically for his silence. The friend made no reply. It afterwards turned out that he had met his death by suicide at about the time of the dream. Let us leave the problem of telepathy on one side:[1] there seems, however, not to be any doubt that here the dumbness in the dream represented death. Hiding and being unfindable – a thing which confronts the prince in the fairy tale of Cinderella three times – is another unmistakable symbol of death in dreams; so, too, is a marked pallor, of which the 'paleness' of the lead in one reading of Shakespeare's text is a reminder.[2] It would be very much easier for us to transpose [*Übertragung*] these interpretations from the language of dreams to the mode of expression used in the myth that is now under consideration if we could make it seem probable that dumbness must be interpreted as a sign of being dead in productions other than dreams.

At this point I will single out the ninth story in Grimm's *Fairy Tales*, which bears the title 'The Twelve Brothers'.[3] A king and a queen have twelve children, all boys. The king declares that, if the thirteenth child is a girl, the boys will have to die. In expectation of her birth he has twelve coffins made. With their mother's help the twelve sons take refuge in a hidden wood, and swear death to any girl they may meet. A girl is born, grows up, and learns one day from her mother that she has had twelve brothers. She decides to seek them out, and in the wood she finds the youngest; he recognizes her, but is anxious to hide her on account of the brothers' oath. The sister says: 'I will gladly die, if by so doing I can save my twelve brothers.' The brothers welcome her affectionately, however, and she stays with them and looks after their house for them. In a little garden beside the house grow twelve lilies. The girl picks them and gives [296]
one to each brother. At that moment the brothers are changed into ravens, and disappear, together with the house and garden. (Ravens are spirit-birds; the killing of the twelve brothers by their sister is represented by the picking of the flowers, just as it is at the beginning of the story by the coffins and the disappearance of the brothers.) The girl, who is once more ready to save her brothers from death, is now told that as a condition she must be dumb for seven years, and not speak a single word. She submits to the test, which brings her herself into mortal danger. She herself, that is, dies for her brothers, as she promised to do before she met them. By remaining dumb she succeeds at last in setting the ravens free.

1 [Cf. Freud's later paper on 'Dreams and Telepathy' (1922*a*), *RSE*, **18**.]

2 Stekel (1911*a*), loc. cit.

3 ['Die zwölf Brüder.' Grimm, 1918, **1**, 42.]

In the story of 'The Six Swans'[1] the brothers who are changed into birds are set free in exactly the same way – they are restored to life by their sister's dumbness. The girl has made a firm resolve to free her brothers, 'even if it should cost her her life'; and once again (being the wife of the king) she risks her own life because she refuses to give up her dumbness in order to defend herself against evil accusations.

It would certainly be possible to collect further evidence from fairy tales that dumbness is to be understood as representing death. These indications would lead us to conclude that the third one of the sisters between whom the choice is made is a dead woman. But she may be something else as well – namely, Death itself, the Goddess of Death. Thanks to a displacement [*Verschiebung*]^{T} that is far from infrequent, the qualities that a deity imparts to men are ascribed to the deity himself. Such a displacement will surprise us least of all in relation to the Goddess of Death, since in modern versions and representations, which these stories would thus be forestalling, Death itself is nothing other than a dead man.

But if the third of the sisters is the Goddess of Death, the sisters are known to us. They are the Fates, the Moerae, the Parcae or the Norns, the third of whom is called Atropos, the inexorable.

II

We will for the time being put aside the task of inserting the
[297] interpretation that we have found into our myth, and listen to what the mythologists have to teach us about the role and origin of the Fates.[2]

The earliest Greek mythology (in Homer) knew only a single *Moῖρα*, personifying inevitable fate. The further development of this one Moera into a company of three (or less often two) sister-goddesses probably came about on the basis of [*in Anlehnung an*]^{T} other divine figures to which the Moerae were closely related – the Graces and the Horae [the Seasons].

The Horae were originally goddesses of the waters of the sky, dispensing rain and dew, and of the clouds from which rain falls; and, since the clouds were conceived of as something that has been spun, it came about that these goddesses were looked upon as spinners, an attribute that then became attached to the Moerae. In the sun-favoured Mediterranean lands it is the rain on which the fertility of the soil

1 ['Die sechs Schwäne.' Grimm, 1918, **1**, 217. (No. 49.)]

2 What follows is taken from Roscher's lexicon [1884–1937], under the relevant headings.

depends, and thus the Horae became vegetation goddesses. The beauty of flowers and the abundance of fruit was their doing, and they were accredited with a wealth of agreeable and charming traits. They became the divine representatives of the Seasons, and it is possibly owing to this connection that there were three of them, if the sacred nature of the number three is not a sufficient explanation. For the peoples of antiquity at first distinguished only three seasons: winter, spring and summer. Autumn was added only in late Graeco-Roman times, after which the Horae were often represented in art as four in number.

The Horae retained their relation to time. Later they presided over the times of day, as they did at first over the times of the year; and at last their name came to be merely a designation of the hours (*heure, ora*). The Norns of German mythology are akin to the Horae and the Moerae and exhibit this time signification in their names.[1] It was inevitable, however, that a deeper view should come to be taken of the essential nature of these deities, and that their essence should be transposed on to the regularity with which the seasons change. The Horae thus became the guardians of natural law and of the divine Order which causes the same thing to recur in Nature in an unalterable sequence.

This discovery of Nature reacted on the conception of human life. The [298]
nature myth changed into a human myth: the weather goddesses became goddesses of Fate. But this aspect of the Horae found expression only in the Moerae, who watch over the necessary ordering of human life as inexorably as do the Horae over the regular order of nature. The ineluctable severity of law and its relation to death and dissolution, which had been avoided in the charming figures of the Horae, were now stamped upon the Moerae, as though men had only perceived the full seriousness of natural law when they had to submit their own selves to it.

The names of the three spinners, too, have been significantly explained by mythologists. Lachesis, the name of the second, seems to denote 'the accidental that is included in the regularity of destiny'[2] – or, as we should say, 'experience'; just as Atropos stands for 'the ineluctable' – Death. Clotho would then be left to mean the innate disposition with its fateful implications.

But now it is time to return to the theme which we are trying to interpret – the theme of the choice between three sisters. We shall be deeply disappointed to discover how unintelligible the situations under review become and what contradictions of their apparent content result, if we

1 [Their names may be rendered: 'What was', 'What is', 'What shall be'.]

2 Roscher [ibid.], quoting Preller, ed. Robert (1894).

apply to them the interpretation that we have found. On our supposition the third of the sisters is the Goddess of Death, Death itself. But in the Judgement of Paris she is the Goddess of Love, in the tale of Apuleius she is someone comparable to the goddess for her beauty, in *The Merchant of Venice* she is the fairest and wisest of women, in *King Lear* she is the one loyal daughter. We may ask whether there can be a more complete contradiction. Perhaps, improbable though it may seem, there is a still more complete one lying close at hand. Indeed, there certainly is; since, whenever our theme occurs, the choice between the women is free, and yet it falls on death. For, after all, no-one chooses death, and it is only by a fatality that one falls victim to it.

However, contradictions of a certain kind – replacements by the precise opposite – offer no serious difficulty to the work of analytic interpretation. We shall not appeal here to the fact that contraries are so often represented by one and the same element in the modes of expression used by the unconscious, as for instance in dreams.[1] But we shall [299] remember that there are motive forces [*Motive*][T] in mental life which bring about replacement by the opposite in the form of what is known as reaction-formation [*Reaktionsbildung*]; and it is precisely in the revelation of such hidden forces as these that we look for the reward of this enquiry. The Moerae were created as a result of a discovery that warned man that he too is a part of nature and therefore subject to the immutable law of death. Something in man was bound to struggle against this subjection, for it is only with extreme unwillingness that he gives up his claim to an exceptional position. Man, as we know, makes use of his imaginative activity in order to satisfy the wishes that reality does not satisfy. So his imagination rebelled against the recognition of the truth embodied in the myth of the Moerae, and constructed instead the myth derived from it, in which the Goddess of Death was replaced by the Goddess of Love and by what was equivalent to her in human shape. The third of the sisters was no longer Death; she was the fairest, best, most desirable and most lovable of women. Nor was this substitution in any way technically difficult: it was prepared for by an ancient ambivalence, it was carried out along a primaeval line of connection which could not long have been forgotten. The Goddess of Love herself, who now took the place of the Goddess of Death, had once been identical to her. Even the Greek Aphrodite had not wholly relinquished her connection with the underworld, although she had long surrendered her chthonic role to other divine figures, to Persephone, or to the tri-form

1 [Cf. *The Interpretation of Dreams* (1900*a*), *RSE*, **4**, 283 f.]

Artemis-Hecate. The great mother goddesses of the oriental peoples, however, all seem to have been both creators and destroyers – both goddesses of life and fertility and goddesses of death. Thus the replacement by a wishful opposite in our theme harks back to a primaeval identity.

The same consideration answers the question how the feature of a choice came into the myth of the three sisters. Here again there has been a wishful reversal. Choice stands in the place of necessity, of destiny. In this way man overcomes death, which he has recognized intellectually. No greater triumph of wish fulfilment is conceivable. A choice is made where in reality there is obedience to a compulsion; and what is chosen is not a figure of terror, but the fairest and most desirable of women.

On closer inspection we observe, to be sure, that the original myth is [300] not so thoroughly distorted that traces of it do not show through and betray its presence. The free choice between the three sisters is, properly speaking, no free choice, for it must necessarily fall on the third if every kind of evil is not to come about, as it does in *King Lear*. The fairest and best of women, who has taken the place of the Death goddess, has kept certain characteristics that border on the uncanny, so that from them we have been able to guess at what lies beneath.[1]

So far we have been following out the myth and its transformation, and it is to be hoped that we have correctly indicated the hidden causes of the transformation. We may now turn our interest to the way in which the dramatist has made use of the theme. We get an impression that a reduction of the theme to the original myth is being carried out in his work, so that we once more have a sense of the moving significance which had been weakened by the distortion. It is by means of this reduction of the distortion, this partial return to the original, that the dramatist achieves his more profound effect upon us.

To avoid misunderstandings, I should like to say that it is not my purpose to deny that King Lear's dramatic story is intended to inculcate two wise lessons: that one should not give up one's possessions and rights during one's lifetime, and that one must guard against accepting flattery at its face value. These and similar warnings are undoubtedly brought

1 The Psyche of Apuleius's story has kept many traits that remind us of her relation with death. Her wedding is celebrated like a funeral, she has to descend into the underworld, and afterwards she sinks into a death-like sleep (Otto Rank). – On the significance of Psyche as goddess of the spring and as 'Bride of Death', cf. Zinzow (1881). – In another of Grimm's Tales ('The Goose-girl at the Fountain' ['Die Gänsehirtin am Brunnen', 1918, **2**, 300], No. 179) there is, as in 'Cinderella', an alternation between the beautiful and the ugly aspect of the third sister, in which one may no doubt see an indication of her double nature – before and after the substitution. This third daughter is repudiated by her father, after a test which is almost the same as the one in *King Lear*. Like her sisters, she has to declare how fond she is of their father, but can find no expression for her love but a comparison with salt. (Kindly communicated by Dr Hanns Sachs.)

out by the play; but it seems to me quite impossible to explain the overpowering effect of *King Lear* from the impression that such a train of thought would produce, or to suppose that the dramatist's personal motives did not go beyond the intention of teaching these lessons. It is
[301] suggested, too, that his purpose was to present the tragedy of ingratitude, the sting of which he may well have felt in his own heart, and that the effect of the play rests on the purely formal element of its artistic presentation; but this cannot, so it seems to me, take the place of the understanding brought to us by the explanation we have reached of the theme of the choice between the three sisters.

Lear is an old man. It is for this reason, as we have already said, that the three sisters appear as his daughters. The relationship of a father to his children, which might be a fruitful source of many dramatic situations, is not turned to further account in the play. But Lear is not only an old man: he is a dying man. In this way the extraordinary premise of the division of his inheritance loses all its strangeness. But the doomed man is not willing to renounce the love of women; he insists on hearing how much he is loved. Let us now recall the moving final scene, one of the culminating points of tragedy in modern drama. Lear carries Cordelia's dead body on to the stage. Cordelia is Death. If we reverse the situation it becomes intelligible and familiar to us. She is the Death goddess who, like the Valkyrie in German mythology, carries away the dead hero from the battlefield. Eternal wisdom, clothed in the primaeval myth, bids the old man renounce love, choose death and make friends with the necessity of dying.

The dramatist brings us nearer to the ancient theme by representing the man who makes the choice between the three sisters as aged and dying. The regressive revision which he has thus applied to the myth, distorted as it was by wishful transformation, allows us enough glimpses of its original meaning to enable us perhaps to reach as well a superficial allegorical interpretation of the three female figures in the theme. We might argue that what is represented here are the three inevitable relations that a man has with a woman – the woman who bears him, the woman who is his mate and the woman who destroys him; or that they are the three forms taken by the figure of the mother in the course of a man's life – the mother herself, the beloved one who is chosen after her pattern, and lastly the Mother Earth who receives him once more. But it is in vain that an old man yearns for the love of woman as he had it first from his mother; the third of the Fates alone, the silent Goddess of Death, will take him into her arms.

TWO LIES TOLD BY CHILDREN

The present translation is a revised and corrected reprint of the *SE* version.

On its first appearance in the *Zeitschrift* (in the summer of 1913) this paper was the first of several by various writers included under a general caption 'Aus dem infantilen Seelenleben'. This caption was incorporated in the 1918 reprint of the paper and was also inserted in the title of the English translation of 1924; thereafter it was dropped.

TWO LIES TOLD BY CHILDREN

We can understand children telling lies, when in doing so, they are imitating the lies told by grown-up people. But a number of lies told by well-brought-up children have a particular significance and should cause those in charge of them to reflect rather than be angry. These lies occur under the influence of excessive feelings of love, and become momentous when they lead to a misunderstanding between the child and the person it loves. [305]

I

A girl of seven (in her second year at school) had asked her father for some money to buy colours for painting Easter eggs. Her father had refused, saying he had no money. Shortly afterwards the girl asked her father for some money for a contribution towards a wreath for the funeral of their reigning princess, who had recently died. Each of the schoolchildren was to bring fifty pfennigs. Her father gave her ten marks; she paid her contribution, put nine marks on her father's writing table, and with the remaining fifty pfennigs bought some paints, which she hid in her toy cupboard. At dinner her father asked suspiciously what she had done with the missing fifty pfennigs, and whether she had not bought paints with them after all. She denied it; but her brother, who was two years her elder and with whom she had planned to paint the eggs, betrayed her; the paints were found in the cupboard. The angry father handed the culprit over to her mother for punishment, and it was severely administered. Afterwards her mother was herself much shaken, when she saw how great the child's despair was. She caressed the little girl after the punishment, and took her for a walk to console her. But the effects of the experience, which were described by the patient herself as the 'turning point in her life', proved to be ineradicable. Up to then she had been a wild, self-confident child, afterwards she became shy and timid. When she was engaged to be married and her mother undertook

the purchase of her furniture and her trousseau, she flew into a rage which was incomprehensible even to herself. She had a feeling that after
[306] all it was *her* money, and no-one else ought to buy anything with it. As a young wife she was shy of asking her husband for any expenditure on her personal needs, and made an uncalled-for distinction between 'her' money and his. During the treatment it happened now and again that her husband's remittances to her were delayed, so that she was left without resources in a foreign city. After she had told me this once, I made her promise that if it happened again she would borrow the small sum necessary from me. She promised to do so; but on the next occasion of financial embarrassment she did not keep her promise, but preferred to pawn her jewellery. She explained that she could not take money from me.

The appropriation of the fifty pfennigs in her childhood had had a significance which her father could not guess. Some time before she began going to school she had played a singular prank with money. A neighbour with whom they were friendly had sent the girl out with a small sum of money, in the company of her own little boy who was even younger, to buy something in a shop. Being the elder of the two, she was bringing the change back home. But, meeting the neighbour's servant in the street, she threw the money down on the pavement. In the analysis of this action, which she herself found inexplicable, the thought of Judas occurred to her, who threw down the thirty pieces of silver which he had been given for betraying his Master. She said she was certainly acquainted with the story of the Passion before she went to school. But in what way could she identify herself with Judas?

When she was three and a half[1] she had a nursemaid of whom she was extremely fond. This girl became involved in a love affair with a doctor whose surgery she visited with the child. It appears that at that time the child witnessed various sexual proceedings. It is not certain whether she saw the doctor give the girl money; but there is no doubt that, to make sure of the child's keeping silence, the girl gave her some small coins, with which purchases were made (probably of sweets) on the way home. It is possible too that the doctor himself occasionally gave the child money. Nevertheless, the child betrayed the girl to her mother out of jealousy. She played so ostentatiously with the coins she had brought home that her mother could not help asking: 'Where did you get that money?' The girl was dismissed.

[307] To take money from anyone had thus early come to mean to her a physical surrender, an erotic relation. To take money from her father was

1 [In 1913 only, 'three and a quarter'.]

equivalent to a declaration of love. The phantasy that her father was her lover was so seductive that with its help her childish wish for paints for the Easter eggs easily put itself into effect in spite of the prohibition. She could not admit, however, that she had appropriated the money; she was obliged to deny it [*leugnen*]^{T}, because her motive for the deed, which was unconscious to herself, could not be admitted. Her father's punishment was thus a rejection of the tenderness she was offering him – a humiliation – and so it broke her spirit. During the treatment a period of severe depression occurred (whose explanation led to her remembering the events described here) when on one occasion I was obliged to reproduce this humiliation by asking her not to bring me any more flowers. *Verleugnung*

For psychoanalysts I need hardly emphasize the fact that in this little experience of the child's we have before us one of those extremely common cases in which early anal erotism persists into later erotic life. Even her desire to paint the eggs with colours derived from the same source.

II

A woman[1] who is now seriously ill in consequence of a frustration [*Versagung*]^{T} in life was in her earlier years a particularly capable, truth-loving, serious and virtuous girl, and became an affectionate[2] wife. But still earlier, in the first years of her life, she had been a wilful and discontented child, and, though she had changed fairly quickly into an excessively good and conscientious one, there were occurrences in her schooldays, which, when she fell ill, caused her deep self-reproaches, and were regarded by her as proofs of fundamental depravity. Her memory told her that in those days she had often bragged and lied. Once on the way to school a schoolfellow had said boastfully: 'Yesterday we had ice at dinner.' She replied: 'Oh we have ice every day.' In reality she did not know what ice at dinner could mean; she only knew ice in the long blocks in which it is carted about, but she assumed that there must be something grand in having it for dinner, so she refused to be outdone by her schoolfellow. [308]

When she was ten years old, they were set the task in the drawing lesson of making a free-hand drawing of a circle. But she used a pair of compasses, thus easily producing a perfect circle, and showed her

1 [This case is discussed in more detail in Freud (1941*d*), *RSE*, **18**, 175 ff. See also the Editors' Note to Freud (1913*a*), p. 265 above.]

2 [In 1913 only, the words 'and happy' appeared at this point.]

achievement in triumph to her neighbour in class. The mistress came up, heard her boasting, discovered the marks of the compasses in the circle, and questioned the girl. But she stubbornly denied [*leugnete*] what she had done, would not give way to any evidence, and took refuge in sullen silence. The mistress consulted with her father about it. They were both influenced by the girl's usually good behaviour into deciding not to take any further steps about the matter.

Both the child's lies were instigated by the same complex. As the eldest of five children, the little girl early developed an unusually strong attachment to her father, which was destined when she was grown up to wreck her happiness in life. But she could not long escape the discovery that her beloved father was not so great a personage as she was inclined to think him. He had to struggle against money difficulties; he was not so powerful or so distinguished as she had imagined. But she could not put up with this departure from her ideal. Since, as women do, she based all her ambition on the man she loved, she became too strongly dominated by the motive of supporting her father against the world. So she boasted to her schoolfellows, in order not to have to belittle her father. When, later on, she learnt to translate ice for dinner by '*glace*', her self-reproaches about this reminiscence led her by an easy path into a pathological dread of pieces or splinters of glass.[1]

Her father was an excellent draughtsman, and had often enough excited the delight and admiration of the children by exhibitions of his skill. It was as an identification of herself with her father that she had drawn the circle at school – which she could only do successfully by deceitful methods. It was as though she wanted to boast: 'Look at what my father can do!' The sense of guilt that was attached to her excessive fondness for her father found its expression in connection with her attempted deception; an admission was impossible for the same reason
[309] that was given in the first of these observations [p. 304 f. above]: it would inevitably have been an admission of her hidden incestuous love.

We should not think lightly of such episodes in the life of children. It would be a serious mistake to read into childish misdemeanours like these a prognosis of the development of a bad character. Nevertheless, they are intimately connected with the most powerful motive forces [*Motiven*] in children's minds, and give notice of dispositions that will lead to later eventualities in their lives or to future neuroses.

1 [The German '*Glas*', like its English equivalent 'glass', has a sound similar to that of the French '*glace*' ('ice').]

THE DISPOSITION TO OBSESSIONAL NEUROSIS

A Contribution to the Problem of Choice of Neurosis

The present translation is a revised and corrected reprint of the *SE* version.

This paper was read by Freud before the Fourth International Psychoanalytical Congress, held at Munich on September 7 and 8, 1913, and was published at the end of that year.

Two topics of special importance are discussed in it. First, there is the problem of 'choice of neurosis',[1] which gives the work its subheading. It was a problem that had vexed Freud from very early times. Three long discussions of it can be found among the Fliess papers, dating from January 1, 1896 (Freud, 1950*a*, Draft K), May 30, 1896 (ibid., Letter 46, where the phrase itself appears), and December 6, 1896 (ibid., Letter 52).[2] At about the same time as the first two of these, references to the subject appeared in three of Freud's published papers, in his French paper on heredity and

1 In all this, of course, only the *psychoneuroses* are concerned.

2 References to the Fliess correspondence are enumerated in the *RSE* in accordance with the original 1950*a* edition. See the Editor's Preface to the Revised Edition (*RSE*, **1**, xxx).

the aetiology of the neuroses (1896*a*), in the second of his two on the neuropsychoses of defence (1896*b*), and in that on 'The Aetiology of Hysteria' (1896*c*), *RSE*, **3**.

[314] In these early discussions of the problem two different solutions may be distinguished, which were alike, however, in postulating a traumatic aetiology for the neuroses. First there was the passive and active theory mentioned in the present paper (below, p. 314 f.), the theory that passive sexual experiences in early childhood predisposed to hysteria and active ones to obsessional neurosis. Ten years later, in a discussion of the part played by sexuality in the neuroses (1906*a*), Freud repudiated this theory entirely (*RSE*, **7**, 284 f.).

The second of these early theories, which was not kept completely distinct from the first one, attributed the decisive factor to chronological considerations. The form taken by a neurosis was supposed to depend on the period of life at which the traumatic experience occurred or, in another version, on the period of life at which defensive action was taken against the revival of the traumatic experience. In a letter to Fliess of January 24, 1897 (Freud, 1950*a*, Letter 57), he wrote: 'Meanwhile the notion I have hitherto entertained, that choice of neurosis was determined by the time of its genesis, is becoming less secure; the choice seems rather to be fixed in earliest childhood. But the decision still oscillates between the time of genesis and the time of repression, though I now prefer the latter.' And a few months later, on November 14, 1897 (ibid., Letter 75): 'Choice of neurosis – the decision whether hysteria, obsessional neurosis or paranoia is generated – probably depends on the nature of the wave [of development] (that is, on its chronological situation) which makes repression possible (that is, which transforms a source of internal pleasure into one of internal disgust).'

But after another two years, on December 9, 1899 (ibid., Letter 125), there comes a passage which seems to foreshadow Freud's later views: 'Not long ago I had what may have been a first glimpse of something new. I have before me the problem of "choice of neurosis". When does a person become hysterical instead of paranoic? A first crude attempt, made at a time when I was trying to storm the citadel by force, put forward the view that it depended on the age at which the sexual traumas occurred – on the subject's age at the time of the experience. I gave that up long ago and was left without a clue till a few days ago, when a link with the theory of sexuality dawned on me.

'The lowest sexual stratum is auto-erotism, which does without any psychosexual aim and demands only local feelings of satisfaction. It is succeeded by
[315] allo-erotism (homo- and hetero-erotism); but it certainly also continues to exist as a separate current. Hysteria (and its variant, obsessional neurosis) is allo-erotic: its main path is identification with the person loved. Paranoia dissolves the identification once more; it re-establishes all the figures loved in childhood which have been abandoned (cf. my discussion of exhibitionist dreams),[1] and it dissolves the ego itself into extraneous figures.[2] Thus I have come to regard paranoia as a forward surge of the auto-erotic current, as a return to the standpoint prevailing then. The perversion corresponding to it would be what is known as "idiopathic paranoia".[3] The special relations of

1 *The Interpretation of Dreams* (1900*a*) had already been published. The passage in question, which occupies Section D (*α*) of Chapter V; *RSE*, **4**, 215–20, traces back exhibitionist dreams to situations in very early childhood.

2 This seems to foreshadow a remark about hysteria and paranoia in the Schreber analysis (p. 43 above).

3 '*Originäre Verrücktheit*.' A concept current in German psychiatry in the latter half of the nineteenth century.

auto-erotism to the original "ego" would throw a clear light on the nature of this neurosis. At this point the thread breaks off.'

Here Freud was approaching the position outlined in the closing pages of his *Three Essays* (1905*d*), *RSE*, **7**, 208 ff. The complicated process of sexual development had suggested a new version of the chronological theory: the notion of a succession of possible 'fixation points', at which that process is liable to be held up, and to which a regression may take place if difficulties are met with in later life. It was not for several years, however, that any explicit statement was made of the relation between this succession of fixation points and the choice of neurosis. This was in the paper on the two principles of mental functioning (1911*b*), p. 220 f. above, and (at much greater length) in the almost contemporary Schreber analysis (1911*c*), p. 59, etc. above. (It seems probable that this last discussion was what Freud had in mind in speaking here (p. 314) of an earlier approach to the problem.) But the whole question is examined in more general terms in the present paper.

This leads us to the second topic of special importance which it discusses – the topic, namely, of pregenital 'organizations' of the libido. The notion is now such a familiar one that we are surprised to learn that it made its first appearance here; but the whole section of the *Three Essays* dealing with it (*RSE*, **7**, 174–7) was in fact only added in 1915, [316]
two years after this paper was published. The knowledge of there being non-genital component sexual drives goes back, of course, very much further. It is prominent in the first edition of the *Three Essays* (1905*d*) and implied, in the Fliess letters, earlier still. (See, for instance, Letter 75 of November 14, 1897.) What is new is the idea of there being regular stages in sexual development at which one or other of the component drives dominates the whole picture.

Only one such stage, the anal-sadistic one, is discussed in the present paper. Freud had, however, already distinguished two earlier stages of sexual development; but these were not characterized by the dominance of any one component drive. The very earliest of all, that of auto-erotism, before any object choice has been made, appears in the first edition of the *Three Essays* (ibid., **7**, 161), but had already been specified in the letter to Fliess of 1899 quoted above (p. 310 f.).[1] The next stage, the first in which object choice occurs but where the object is the person's own self, had been brought forward by Freud, under the name of narcissism, some three or four years before the present paper (see above, p. 52 *n*. 3). Two other organized stages in the development of the libido remained to be described – one earlier and one later than the anal-sadistic one. The earlier one, the oral stage, once again showed the dominance of a component drive; it was first mentioned in the section of the 1915 edition of the *Three Essays* already alluded to (*RSE*, **7**, 175). The later stage, no longer pregenital but not yet fully genital in the adult sense, the 'phallic' stage, only appeared on the scene many years later, in Freud's paper on 'The Infantile Genital Organization' (1923*e*), ibid., **19**.

Thus, the order of publication of Freud's findings on the successive early organizations of the sexual drive may be summarized as follows: auto-erotic stage, 1905 (already described in private, 1899); narcissistic stage, 1910 (in private, 1909); anal-sadistic stage, 1913; oral stage, 1915; phallic stage, 1923.

1 Freud borrowed the actual term 'auto-erotism' from Havelock Ellis, who introduced it in a paper published in the previous year, 1898.

THE DISPOSITION TO OBSESSIONAL NEUROSIS

A Contribution to the Problem of Choice of Neurosis

The problem of why and how a person may fall ill of a neurosis is [317]
certainly among those to which psychoanalysis should offer a solution. But it will probably be necessary to find a solution first to another and narrower problem – namely, why it is that this or that person must fall ill of a particular neurosis and of none other. This is the problem of 'choice of neurosis'.

What do we know so far about this problem? Strictly speaking, only one single general proposition can be asserted on the subject with certainty. It will be recalled that we divide the pathogenic determinants concerned in the neuroses into those which a person brings along with him into his life and those which life brings to him – the constitutional and the accidental – by whose combined operation alone the pathogenic determinant is as a rule established. The general proposition, then, which I have alluded to above, lays it down that the grounds for determining the choice of neurosis are entirely of the former kind – that is, that they are in the nature of dispositions[1] and are independent of experiences which operate pathogenically.

Where are we to look for the source of these dispositions? We have become aware that the psychical functions concerned – above all, the sexual function, but various important ego functions [*Ichfunktionen*][T] *Ich* too – have to undergo a long and complicated development before reaching the state characteristic of the normal adult. We can assume that these developments are not always so smoothly carried out that the total function passes through this regular progressive modification. Wherever a portion of it clings to a previous stage, what is known as a 'point of [318]

1 [In this paper Freud seems always to use the word 'disposition' in the sense of something purely constitutional or hereditary. In later writings he gives the word a wider meaning, and includes under it the effects of experience in infancy. This is made perfectly clear in Lecture XXIII of his *Introductory Lectures* (1916–17*a*), *RSE*, **16**, 319 f. – The 'general proposition' quoted in the text had already been asserted by Freud in his paper on sexuality in the neuroses (1906*a*), ibid., **7**, 284 f.]

Fixierung fixation' [*Fixierungsstelle*][T] results, to which the function may regress if the subject falls ill through some external disturbance.

Thus our dispositions are inhibitions in development [*Entwicklungshemmungen*][T]. We are confirmed in this view by the analogy of the facts of general pathology of other illnesses. But before the question as to what factors can bring about such disturbances of development the work of psychoanalysis comes to a stop: it leaves that problem to biological research.[1]

Hemmung

Already a few years back we ventured, with the help of these hypotheses, to approach the problem of choice of neurosis.[2] Our method of work, which aims at discovering normal conditions by studying their disturbances, led us to adopt a very singular and unexpected line of attack. The order in which the main forms of psychoneurosis are usually enumerated – hysteria, obsessional neurosis, paranoia, dementia praecox – corresponds (even though not quite exactly) to the order of the ages at which the onset of these disorders occurs. Hysterical forms of illness can be observed even in earliest childhood; obsessional neurosis usually shows its first symptoms in the second period of childhood (between the ages of six and eight); while the two other psychoneuroses, which I have brought together under the heading of 'paraphrenia',[3] do not appear until after puberty and during adult life. It is these disorders – the last to emerge – which were the first to show themselves accessible to our enquiry into the dispositions that result in the choice of neurosis. The characteristics peculiar to both of them – megalomania, turning away from the world of objects, increased difficulty in transference – have obliged us to conclude that their dispositional fixation is to be looked for in a stage of libidinal developmental *before* object choice has been established – that is, in the phase of auto-erotism and of narcissism. Thus these forms of illness, which make their appearance so late, go back to very early inhibitions and fixations.

[319] This would accordingly lead us to suppose that the disposition to hysteria and obsessional neurosis, the two transference neuroses proper, which produce their symptoms [*Symptombildung*] at an early age, lies in later phases of libidinal development. But at what point in them should we find a developmental inhibition? and, above all, what would be the

1 Since Wilhelm Fliess's writings have revealed the biological significance of certain periods of time it has become conceivable that disturbances of development may be traceable to temporal changes in the successive waves of development.

2 [See Editors' Note, p. 311 above.]

3 [In the first edition only this clause ran 'which are termed by me paraphrenia and paranoia'. See the Editors' footnote, p. 66 above.]

difference in phases that would determine a disposition to obsessional neurosis as contrasted with hysteria? For a long time nothing was to be learnt about this; and my earlier attempts at discovering these two dispositions – the notion, for instance, that hysteria might be determined by passivity and obsessional neurosis by activity in infantile experience – had soon to be abandoned as incorrect.[1]

I shall now take my footing once more on the clinical observation of an individual case. Over a long period I studied a woman patient whose neurosis underwent an unusual change. It began, after a traumatic experience, as a straightforward anxiety hysteria and retained that character for a few years. One day, however, it suddenly changed into an obsessional neurosis of the severest type. A case of this kind could not fail to become significant in more than one direction. On the one hand, it might perhaps claim to be looked upon like a bilingual document and to show how an identical content could be expressed by the two neuroses in different languages. On the other hand, it threatened to contradict completely our theory that disposition arises from developmental inhibition, unless we were prepared to accept the supposition that a person could innately possess more than one weak spot in his libidinal development.[2] I told myself that we had no right to dismiss this latter possibility; but I was greatly interested to arrive at an understanding of the case.

When in the course of the analysis this came about, I was forced to see that the situation was quite different from what I had imagined. The obsessional neurosis was not a further reaction to the same trauma which had first provoked the anxiety hysteria; it was a reaction to a second experience, which had completely wiped out the first. (Here, then, we have an exception – though, it is true, a not indisputable one – to our proposition affirming that choice of neurosis is independent of experience [p. 313 above].)

Unfortunately I am unable, for familiar reasons [*Motiven*]^{T}, to enter into [320]
the history of the case as far as I should like, and I must restrict myself to the account which follows.[3] Up to the time of her falling ill the patient had been a happy and almost completely satisfied wife. She wanted to have children, from motives [*Motiven*] based on an infantile fixation of her wishes, and she fell ill when she learnt that it was impossible for her to have any by the husband who was the only object of her love. The anxiety

1 [See Editors' Note, p. 310 above.]

2 [Cf. some remarks on this in the Schreber case history (1911*c*), p. 67 f. above.]

3 [The case is discussed further, from a different point of view, in Freud, 1941*d*; *RSE*, **18**, 175 ff.]

hysteria with which she reacted to this frustration [*Versagung*][T] corresponded, as she herself soon learnt to understand, to the repudiation of phantasies of seduction in which her firmly implanted wish for a child found expression. She now did all she could to prevent her husband from guessing that she had fallen ill owing to the frustration of which he was the cause. But I have had good reason for asserting that everyone possesses in his own unconscious an instrument with which he can interpret [*deuten*][T] the utterances of the unconscious in other people.[1] Her husband understood, without any admission or explanation on her part, what his wife's anxiety meant; he felt hurt, without showing it, and in his turn reacted neurotically by – for the first time – failing in sexual intercourse with her. Immediately afterwards he started on a journey. His wife believed that he had become permanently impotent, and produced her first obsessional symptoms on the day before his expected return.

The content of her obsessional neurosis was a compulsion for scrupulous washing and cleanliness and extremely energetic protective measures against severe injuries which she thought other people had reason to fear from her – that is to say, reaction-formations against her own *anal-erotic* and *sadistic* impulses. Her sexual need was obliged to find expression in these shapes after her genital life had lost all its value owing to the impotence of the only man of whom there could be any question for her.

This is the starting point of the small new fragment of theory which I have formulated. It is of course only in appearance that it is based on this one observation; actually it brings together a large number of earlier impressions, though an understanding of them was only made possible by this last experience. I told myself that my schematic picture of the development of the libidinal function called for an extra insertion in it.
[321] To begin with, I had only distinguished, first the phase of auto-erotism,
Trieb during which the subject's component drives [*Partialtriebe*][T], each on its own account, seek the satisfaction of their desires in his own body, and then the combination of all the component drives for the choice of an object, under the primacy of the genitals acting on behalf of reproduction. The analysis of the paraphrenias has, as we know, necessitated the insertion between them of a stage of narcissism, during which the choice of an object has already taken place but that object coincides with the subject's own ego.[2] And now we see the need for yet another stage to be

1 [Cf. 'The Unconscious' (1915*e*), *RSE*, **14**, 171.]

2 [See Freud's later paper on narcissism (1914*c*), ibid., **14**; he had already put forward the idea in several places, particularly in the Schreber analysis (1911*c*), see above, p. 52 ff.]

inserted before the final shape is reached – a stage in which the component drives have already come together for the choice of an object and that object is already something extraneous in contrast to the subject's own self, but in which *the primacy of the genital zones has not yet been established*. On the contrary, the component drives which dominate this *pregenital organization*[1] of sexual life are the anal-erotic and sadistic ones.

I am aware that any such hypotheses sound strange at first. It is only by discovering their relations to our former knowledge that they become familiar to us; and in the end it is often their fate to be regarded as minor and long-foreseen innovations. Let us therefore turn with anticipations such as these to a discussion of the 'pregenital sexual organization'.

(*a*) The extraordinary part played by impulses [*Regungen*][T] of hatred and anal erotism in the symptomatology of obsessional neurosis has already struck many observers and has recently been emphasized with particular clarity by Ernest Jones (1913*b*). This follows directly from our hypothesis if we suppose that in that neurosis the component drives in question have once more taken over the representation of the genital drives, whose forerunners they were in the process of development.

At this point a portion of our case history fits in, which I have so far kept back. The patient's sexual life began in her earliest childhood with beating phantasies. After they were suppressed, an unusually long period of latency set in, during which the girl passed through a period of exalted [322]
moral growth, without any awakening of female sexual feelings [*Sexualempfinden*][T]. Her marriage, which took place at an early age, *Sex*
opened a time of normal sexual activity. This period, during which she was a happy wife, continued for a number of years, until her first great frustration brought on the hysterical neurosis. When this was followed by her genital life losing all its value, her sexual life, as I have said, returned to the infantile stage of sadism.

It is not difficult to determine the characteristic which distinguishes this case of obsessional neurosis from those more frequent ones which start at an early age and thereafter run a chronic course with exacerbations of a more or less striking kind. In these other cases, once the sexual organization which contains the disposition to obsessional neurosis is established it is never afterwards completely surmounted; in our case it was replaced to begin with by the higher stage of development, and was then reactivated by regression from the latter.

1 [The term is here used for the first time.]

(*b*) If we wish to bring our hypothesis into contact with biological lines of thought, we must not forget that the antithesis between male and female, which is introduced by the reproductive function, cannot be present as yet at the stage of pregenital object choice. We find in its place the antithesis between trends with an active and with a passive aim, an antithesis which later becomes firmly attached to that between the sexes. Activity is supplied by the common drive to mastery [*Bemächtigungstrieb*], which we call sadism when we find it in the service of the sexual function; and even in fully developed normal sexual life it has important subsidiary services to perform. The passive trend is fed by anal erotism, whose erotogenic zone corresponds to the old, undifferentiated cloaca. A stressing of this anal erotism in the pregenital stage of organization leaves behind a significant predisposition to homosexuality in men when the next stage of the sexual function, the primacy of the genitals, is reached. The way in which this last phase is erected upon the preceding one and the accompanying remoulding of the libidinal cathexes [*Libidobesetzungen*][T] present analytic research with the most interesting problems.

Besetzung

The view may be taken that all the difficulties and complications involved in this can be avoided by denying [*verleugnet*][T] that there is any pregenital organization of sexual life and by holding that sexual life coincides with the genital and reproductive function and begins with it. It would then be asserted, having regard to the unmistakable findings of analytic research, that the neuroses are compelled by the process of sexual repression [*Sexualverdrängung*][T] to give expression to sexual trends through other, nonsexual drives, and thus to sexualize the latter by way of compensation. But this line of argument would place us outside psychoanalysis. It would place us where we were before psychoanalysis and would mean abandoning the understanding which psychoanalysis has given us of the relations between health, perversion and neurosis. Psychoanalysis stands or falls with the recognition of the sexual component drives, of the erotogenic zones and of the extension thus made possible of the concept of a 'sexual function' in contrast to the narrower 'genital function'. Moreover, the observation of the normal development of children is in itself enough to make us reject any such temptation.

Verleugnung

[323]

Verdrängung

(*c*) In the field of the development of *character* we are bound to meet with the same drive forces [*Triebkräften*][T] which we have found at work in the neuroses. But a sharp theoretical distinction between the two is necessitated by the single fact that the failure of repression and the return

of the repressed – which are peculiar to the mechanism of neurosis – are absent in the formation of character. In the latter, repression either does not come into action or smoothly achieves its aim of replacing the repressed with reaction-formations and sublimations. Hence the processes of the formation of character are more obscure and less accessible to analysis than neurotic ones.[1]

But it is precisely in the field of character development that we come across a good analogy with the case we have been describing – a confirmation, that is, of the occurrence of the pregenital sadistic anal-erotic sexual organization. It is a well-known fact, and one that has given much ground for complaint, that after women have lost their genital function their character often undergoes a peculiar alteration. They become quarrelsome, vexatious and overbearing, petty and stingy; that is to say, they exhibit typically sadistic and anal-erotic traits which they did not possess earlier, during their period of womanliness. Writers of comedy and satirists have in all ages directed their invectives against the 'old dragon' into which the charming girl, the loving wife and the tender mother have been transformed. We can see that this alteration of character corresponds to a regression of sexual life to the pregenital sadistic and anal-erotic stage, in which we have discovered the disposition to obsessional neurosis. It seems, then, to be not only the precursor to the genital phase but often enough its successor as well, its termination after the genitals have fulfilled their function. [324]

A comparison between such a change of character and obsessional neurosis is very impressive. In both cases the work of regression is apparent. But whereas in the former we find complete regression following repression (or suppression) that has occurred smoothly, in the neurosis there are conflict, an effort to prevent regression from occurring, reaction-formations against it and symptom-formations produced by compromises between the two opposing sides, and a splitting of the psychical activities into some that are admissible to consciousness and others that are unconscious.

(*d*) Our hypothesis of a pregenital sexual organization is incomplete in two respects. In the first place, it takes no account of the behaviour of other component drives, in regard to which there is plenty that would repay examination and discussion, and it is content with stressing the

1 [Cf. Freud's earlier paper on 'Character and Anal Erotism' (1908*b*), *RSE*, **9**, 149 ff., and, for some general remarks on character formation, a passage in the *Three Essays* (1905*d*), ibid., **7**, 211, and a longer and later discussion at the beginning of Chapter III of *The Ego and the Id* (1923*b*), ibid., **19**, 24 ff.]

striking primacy of sadism and anal erotism.[1] In particular we often gain an impression that the drive to knowledge can actually take the place of sadism in the mechanism of obsessional neurosis. Indeed it is at bottom a sublimated offshoot of the drive to mastery exalted into something intellectual, and its repudiation in the form of doubt plays a large part in the picture of obsessional neurosis.[2]

The second gap in our hypothesis is far more important. As we know, the developmental disposition to a neurosis is only complete if the phase of the development of the ego at which fixation occurs is taken into account as well as that of the libido. But our hypothesis has only related
[325] to the latter, and therefore does not include all the knowledge that we should demand. The stages of development of the ego drives are at present very little known to us; I know of only one attempt – the highly promising one made by Ferenczi (1913*c*) – to approach these questions. I cannot tell if it may seem too rash if, on the basis of such indications as we possess, I suggest the possibility that a chronological outstripping of libidinal development by ego development should be included in the disposition to obsessional neurosis. A precocity of this kind would necessitate the choice of an object under the influence of the ego drives, at a time at which the sexual drives had not yet assumed their final shape, and a fixation at the stage of the pregenital sexual organization would thus be left. If we consider that obsessional neurotics have to develop a super-morality in order to protect their object love from the hostility lurking behind it, we shall be inclined to regard some degree of this precocity of ego development as typical of human nature and to derive the capacity for the origin of morality from the fact that in the order of development hate is the precursor of love. This is perhaps the meaning of an assertion by Stekel (1911*a*, 536), which at the time I found incomprehensible, to the effect that hate and not love is the primary emotional relation between men.[3]

(*e*) It follows from what has been said that there remains for hysteria an intimate relation to the final phase of libidinal development, which is characterized by the primacy of the genitals and the introduction of the reproductive function. In hysterical neurosis this acquisition is subjected to repression, which does not involve regression to the pregenital stage.

1 [The existence of an earlier pregenital organization, characterized by the primacy of the oral zone, was not pointed out by Freud until some years later. See Editors' Note, p. 311 above.]

2 [See the 'Rat Man' case history (1909*d*), *RSE*, **10**, 182–4.]

3 [This was elaborated by Freud at the end of his metapsychological paper on 'Drives and their Vicissitudes' (1915*c*), ibid., **14**, 120 ff.]

The gap in determining the disposition owing to our ignorance of ego development is even more obvious here than with obsessional neurosis.

On the other hand, it is not hard to show that another regression to an earlier level occurs in hysteria too. The sexuality of female children is, as we know, dominated and directed by a masculine organ (the clitoris) and often behaves like the sexuality of boys. This masculine sexuality has to be got rid of by a last wave of development at puberty, and the vagina, an [326]
organ derived from the cloaca, has to be raised into the dominant erotogenic zone. Now, it is very common in hysterical neurosis for this repressed masculine sexuality to be reactivated and then for the defensive struggle on the part of the ego-syntonic [*ichgerechten*]^{T} drives to be directed *Ichgerecht*
against it. But it seems to me too early to enter here into a discussion of the problems of the disposition to hysteria.

INTRODUCTION TO PFISTER'S *THE PSYCHOANALYTIC METHOD* (1913)

Introduction to Pfister's *The Psychoanalytic Method*
1917 In Pfister, *The Psychoanalytic Method*, New York: Moffat, Yard; London: Kegan Paul, v–viii. (Tr. C. R. Payne.)
1958 *SE*, **12**, 329–31. (Tr. James Strachey.)

The present translation is a revised and corrected reprint of the *SE* version.

Dr Oskar Pfister, a Zürich pastor and educationalist and the author of the work to which this is an introduction, was for thirty years a close friend of Freud's and an unswerving supporter of his views. He was one of the very first laymen to practise psychoanalysis, and the later part of Freud's Introduction is perhaps his earliest published plea in favour of the recognition of non-medical psychoanalysts. He developed his argument at much greater length a decade later in *The Question of Lay Analysis* (1926*e*), *RSE*, **20**.

The date at the end of the Introduction (which appears here by arrangement with Messrs Routledge & Kegan Paul) is omitted in the German reprints.

INTRODUCTION TO PFISTER'S *THE PSYCHOANALYTIC METHOD*

Psychoanalysis had its origin on medical soil, as a therapeutic procedure [329]
for the treatment of certain nervous illnesses which were termed 'functional' and which were considered with increasing certainty to be consequences of disturbances in emotional life. It attains its end – of removing the manifestations of these disturbances, the symptoms – by assuming that they are not the only possible and final outcome of particular psychical processes. It therefore uncovers the history of the development of these symptoms in the patient's memory, it revivifies the processes underlying them, and then conducts them, under the doctor's guidance, to a more favourable outlet. Psychoanalysis has set itself the same therapeutic aims as treatment by hypnotism, which was introduced by Liébeault and Bernheim and after lengthy and severe struggles achieved a place in the technique of nerve specialists. But it goes far deeper into the structure of the mechanism of the mind [*seelischen*][T], and *Seele*
seeks to bring about permanent results and viable changes in its subjects.

In its time, hypnotic treatment by suggestion very soon passed beyond the sphere of medical application and entered the service of the education[1] of young people. If we are to believe the reports, it proved to be an effective means for getting rid of childish faults, of inconvenient physical habits and of character traits that were otherwise irreducible. No-one at that time objected to, or was surprised at, this extension of its uses, which, incidentally, has only been made fully understandable by the researches of psychoanalysis. For we know today that pathological symptoms are often nothing but substitutes for bad (that is, unserviceable) inclinations, and that the determinants of these symptoms are laid down in the years of childhood and youth – during the same period in which human beings are the subject of education – whether the illnesses themselves already emerge in youth or only at a later time of life.

1 [The German words '*Erziehung*' and '*Erzieher*', which are here translated throughout by 'education' and 'educator', have in fact a wider application and include the general notion of the 'upbringing' of children. See *RSE*, **24**, 66.]

[330] Education and therapeutics stand in an assignable relation to each other. Education seeks to ensure that certain of a child's [innate] dispositions and inclinations shall not cause any damage either to the individual or to society. Therapeutics come into action if these same dispositions have already led to the unwished-for result of pathological symptoms. The alternative outcome – of the child's unserviceable dispositions leading, not to substitutes in the form of symptoms, but to direct perversions of character – is almost inaccessible to therapeutics and as a rule beyond the influence of an educator. Education is a prophylaxis, which is intended to obviate both outcomes – neurosis and perversion alike; psychotherapy seeks to undo the less stable of the two outcomes and to institute a kind of after-education.

In view of this position of affairs, the question automatically arises whether psychoanalysis should not be used for educative purposes just as hypnotic suggestion was in the past. The advantages would be obvious. The educator would, on the one hand, be prepared by his knowledge of the general human dispositions of childhood to judge which of those dispositions are threatening to lead to an undesirable outcome; and, if psychoanalysis can influence the course taken by such developments, he could bring it into use *before* the signs of an unfavourable development set in. Thus, with the help of analysis, he could have a prophylactic influence on the child while it was still healthy. On the other hand, he could detect the *first* indications of a development in the direction of neurosis and could guard the child against its further development at a time at which, for various reasons, a child is never taken to see a doctor. One cannot but think that a psychoanalytic activity such as this on the part of the educator – and of the similarly placed pastoral worker in Protestant countries – would inevitably be of inestimable value and might often make the intervention of a doctor unnecessary.

The only question is whether the practice of psychoanalysis may not have as its prerequisite a medical training, from which the educator and the pastoral worker must remain debarred, or whether there may be other considerations which are opposed to the suggestion that the technique of psychoanalysis should be confided to any but a doctor's hands. I confess that I can see no ground for any such reservations. The practice
[331] of psychoanalysis calls much less for medical training than for psychological instruction and a free human outlook. The majority of doctors are not equipped to practise psychoanalysis and have completely failed to grasp the value of that therapeutic procedure. The educator and the pastoral worker are bound by the standards of their profession

to exercise the same consideration, care and restraint as are usually practised by the doctor, and apart from this their association with young people perhaps makes them better fitted to an understanding of [*Einfühlung in*][T] these young people's mental life. But in both cases the only guarantee of the harmless application of the analytic procedure must depend on the personality of the analyst.

Where a case borders upon mental abnormality, the analytic educator will be bound to make himself familiar with the most necessary psychiatric knowledge, and furthermore to call a doctor into consultation when the diagnosis and prognosis of the disturbance appear doubtful. In a number of cases it will only be possible to achieve success if there is collaboration between the educator and the doctor.

In one single respect an educator's responsibility may perhaps exceed that of a doctor. The doctor has as a rule to deal with psychical structures [*Formationen*] which have already become rigid and he will find in the patient's established individuality a limit to his own achievement but at the same time a guarantee of the patient's capacity to stand alone. The educator, however, works upon material which is plastic and open to every impression, and he must keep before himself an obligation not to mould the young mind in accordance with his own personal ideals but rather according to his subject's dispositions and possibilities.

Let us hope that the application of psychoanalysis to the service of education will quickly fulfil the hopes which educators and doctors may rightly attach to it. A book such as this of Pfister's, which seeks to acquaint educators with analysis, will then be able to count on the gratitude of later generations.

Preface to Bourke's *Scatalogic* [sic] *Rites of All Nations*
1934 In J. G. Bourke, *Scatalogic Rites of All Nations* (New Edition), New York: American Anthropological Society, vii–ix.
1950 *CP*, **5**, 88–91. (Under the title 'The Excretory Functions in Psycho-Analysis and Folklore'.) (Tr. J. Strachey.)
1958 *SE*, **12**, 335–7. (Reprint of the 1950 translation, slightly revised.)

The present translation is a revised and corrected reprint of the *SE* version.

The work by Captain John Gregory Bourke (Third Cavalry, USA), to the translation of which Freud contributed this Preface, was originally published in 1891 (Washington: Lowdermilk) with the words 'Not for General Perusal' on the title page. Freud's attention was drawn to the book (no doubt by Ernest Jones) early in 1912, and it seems likely that the German translation was made on his recommendation. It appeared as one of the supplementary volumes issued annually by the periodical *Anthropophyteia* which was edited by one of the translators, F. S. Krauss. Freud had shown his interest in the journal two or three years earlier in an open letter to its editor (1910*f*), *RSE*, **11**. Much of the material quoted in Freud & Oppenheim's paper on 'Dreams in Folklore' (1958*a* [1911]), p. 186 ff. above, was derived from *Anthropophyteia*, and deals with the topics discussed in this Preface.

PREFACE TO BOURKE'S *SCATALOGIC RITES OF ALL NATIONS*

While I was living in Paris in 1885 as a pupil of Charcot, what chiefly attracted me, apart from the great man's own lectures, were the demonstrations and addresses given by Brouardel.[1] He used to show us from post-mortem material at the morgue how much there was which deserved to be known by doctors but of which science preferred to take no notice. On one occasion he was discussing the indications which enabled one to judge the social rank, character and origin of an unidentified body, and I heard him say: '*Les genoux sales sont le signe d'une fille honnête*.' He was using a girl's dirty knees as evidence of her virtue! [335]

The lesson that bodily cleanliness is far more readily associated with vice than with virtue often occurred to me later on, when psychoanalytic work made me acquainted with the way in which civilized men [*Kulturmenschen*][T] today deal with the problem of their physical nature. *Kultur* They are clearly embarrassed by anything that reminds them too much of their animal origin. They are trying to emulate the 'more perfected angels' in the last scene of *Faust*, who complain:

> Uns bleibt ein Erdenrest
> zu tragen peinlich,
> und wär' er von Asbest,
> er ist nicht reinlich.[2]

Since, however, they must necessarily remain far removed from such perfection, men have chosen to evade the predicament by so far as possible denying [*verleugnen*][T] the very existence of this inconvenient 'trace *Verleugnung* of the Earth', by concealing it from one another, and by withholding from it the attention and care which it might claim as an integrating component of their essential being. The wiser course would [336]

1 [P. C. H. Brouardel (1837–1906) was a celebrated figure in forensic medicine. Freud wrote warmly about him in his 'Paris Report' (1956*a* [1886]), *NSW*, **4**; *RSE*, **1**, 8. He also appears in the 'History of the Psychoanalytic Movement' (1914*d*), ibid., **14**, 11.]

2 [Literally: 'We still have a trace of the Earth, which is distressing to bear; and though it were of asbestos it is not cleanly.']

undoubtedly have been to admit its existence and to dignify it as much as its nature will allow.

It is far from being a simple matter to survey or describe the consequences involved in this way of treating the 'distressing trace of the Earth', of which the sexual and excretory functions may be considered the nucleus. It will be enough to mention a single one of these consequences, the one with which we are most concerned here: the fact that science is prohibited from dealing with these proscribed aspects of human life, so that anyone who studies such things is regarded as scarcely less 'improper' than someone who actually *does* improper things.

Nevertheless, psychoanalysis and folklore have not allowed themselves to be deterred from transgressing these prohibitions and have been able as a result to teach us all kinds of things that are indispensable for an understanding of human nature. If we limit ourselves here to what has been learnt about the excretory functions, it may be said that the chief finding from psychoanalytic research has been the fact that the human infant is obliged to recapitulate during the early part of his development the changes in the attitude of the human race towards excremental matters which probably had their start when *homo sapiens* first raised himself off Mother Earth. In the earliest years of infancy there is as yet no trace of shame about the excretory functions or of disgust at excreta. Small children show great interest in these, just as they do in others of their bodily secretions; they like occupying themselves with them and can derive many kinds of pleasure [*Lust*]^{T} from doing so. Excreta, regarded as parts of a child's own body and as products of his own organism, have a share in the esteem – the narcissistic esteem, as we should call it – with which he regards everything relating to his self. Children are, indeed, proud of their own excretions and make use of them to help in asserting themselves against adults. Under the influence of its upbringing, the child's coprophilic drives [*Triebe*]^{T} and inclinations gradually succumb to repression [*Verdrängung*]^{T}; it learns to keep them secret, to be ashamed of them and to feel disgust at their objects. Strictly speaking, however, the disgust never goes so far as to apply to a child's own excretions, but is content with repudiating them when they are the products of other people. The interest which has hitherto been attached to excrement is carried over on to other objects – for instance, from
[337] faeces on to money, which is, of course, late in acquiring significance for children. Important constituents in the formation of character are developed, or strengthened, from the repression of coprophilic inclinations.

Psychoanalysis further shows that, to begin with, excremental and sexual drives are not distinct from each other in children. The divorce between them only occurs later and it remains incomplete. Their original affinity, which is established by the anatomy of the human body, still makes itself felt in many ways in normal adults. Finally, it should not be forgotten that these developments can no more be expected to yield a perfect result than any others. Some portion of the old preferences persist, some part of the coprophilic inclinations continue to operate in later life and are expressed in the neuroses, perversions and bad habits of adults.

Folklore has adopted a quite different method of research, and yet it has reached the same results as psychoanalysis. It shows us how incompletely the repression of coprophilic inclinations has been carried out among various peoples at various times and how closely at other cultural levels the treatment of excretory substances approximates to that practised by children. It also demonstrates the persistent and indeed ineradicable nature of coprophilic interests, by displaying to our astonished gaze the multiplicity of applications – in magical ritual, in tribal customs, in observances of religious cults and in the art of healing – by which the old esteem for human excretions has found new expression. The connection, too, with sexual life seems to be fully preserved.

This expansion of our knowledge clearly involves no risk to our morality. The major part of what is known of the role played by excretions in human life has been brought together in J. G. Bourke's *Scatalogic Rites of All Nations*. To make it accessible to German readers is therefore not only a courageous but also a meritorious undertaking.

Shorter Writings

(1910–13)

MORE CHILDREN[1]

(1910–11)

A prohibition of 'trade in contraceptive devices' is completely pointless. The most obvious, convenient and commonly used contraceptive device, as is well known, is premature interruption of coitus so that the fertilizing sperm is released outside of the female body. No prohibition by the police can prevent a married couple from making use of this method of limiting the number of children. Medical technology has tried to repress this simple procedure, which is detrimental for both male and female, through the supply of less objectionable hygienic devices. Should the sale of these far less harmful contraceptive aids be legally forbidden, the population will undoubtedly fall back on the more detrimental practice.

I am happy to declare myself unqualified to respond to points three and four.

1 [In response to two proposals against trading in contraceptives, contained in new German quackery laws that were then under review, the editor of *Der Sturm*, a Berlin cultural weekly, announced under the heading '*Mehr Kinder*' that he had circulated four questions to prominent personalities and their replies would be published in ensuing issues. The questions were: (1) Should the legal status quo whereby everyone is entitled to practise contraception by suitable methods be retained?; (2) Would it be cause for concern if any such method were to be prohibited?; (3) Is it not actually desirable that fewer, but more viable children are born?; (4) Would a reduction in births result in population decline or would it be balanced by a reduction in the mortality rate? Freud's response appeared three weeks later on March 25, 1911 (in *Der Sturm*, **1**, No. 56, 444). The German text was reprinted by Ulrike May (2009) in *Jb. Psychoan.*, **58**, 46. The present translation by Mark Solms is the first into English. – Freud's scattered remarks on the topic of contraception are listed in an Editors' footnote to *RSE*, **3**, 148 *n.* 2.]

THE SIGNIFICANCE OF SEQUENCES OF VOWELS[1]

(1911)

[341] Objections have no doubt often been raised to the assertion made by Stekel[2] that in dreams and associations [*Einfällen*][T] names which have to be concealed seem to be replaced by others that resemble them only in containing the same sequence of vowels. A striking analogy is, however, provided from the history of religion. Among the ancient Hebrews the name of God was taboo; it might be neither spoken aloud nor written down. (This is far from being an isolated example of the special significance of names in archaic civilizations [*Kulturen*][T].)[3] This prohibition was so implicitly obeyed that to this very day the vocalization of the four consonants in God's name (יהוה [YHVH]) remains unknown. It was, however, pronounced 'Jehovah', being supplied with the vowels of the word 'Adonai' ('Lord'), against which there was no such prohibition. (Reinach, 1905–12, **1**, 1.)

1 ['Die Bedeutung der Vokalfolge.' First published, with the signature 'Freud', under the rubric 'Varia', *Zbl. Psychoan.*, **2** (1911), 105; reprinted *GS*, **11** (1928), 301; *Neurosenlehre und Technik* (1931), 306; *GW*, **8** (1943), 348. English translation by James Strachey: *SE*, **12**, 341 – reprinted here with minor revisions.]

2 [This has not been traced.]

3 [The taboo on names is discussed at length in the second essay in *Totem and Taboo* (1912–13*a*), *RSE*, **13**, 57–60.]

'GREAT IS DIANA OF THE EPHESIANS'[1]

(1911)

The ancient Greek city of Ephesus in Asia Minor, for the exploration of [342]
whose ruins, incidentally, our Austrian archaeology has to be thanked, was especially celebrated in antiquity for its splendid temple dedicated to Artemis (Diana). Ionic invaders – perhaps in the eighth century before Christ – conquered the city, which had long been inhabited by people of Asiatic race, and found in it the cult of an ancient mother goddess who possibly bore the name of Oupis, and identified her with Artemis, a deity of their home land. The evidence of excavations shows that in the course of centuries several temples were erected on the same site in honour of the goddess. It was the fourth of these temples that was destroyed by a fire started by the crazy Herostratus in the year 356, during the night in which Alexander the Great was born. It was rebuilt, more magnificent than ever. With its concourse of priests, magicians and pilgrims, and with its shops in which amulets, mementoes and oblations were offered for sale, the commercial metropolis of Ephesus might be compared to a modern Lourdes.

In about A.D. 54, the apostle Paul spent several years at Ephesus. He preached, performed miracles, and found a large following among the people. He was persecuted and accused by the Jews; and he separated from them and founded an independent Christian community. In consequence of the spread of his doctrine, there was a falling off in the trade of the goldsmiths, who used to make mementoes of the holy place – small figures of Artemis and models of the temple – for the faithful and the pilgrims who came from all over the world.[2] Paul was much too strict a [343]
Jew to allow the old deity to survive under another name, to rebaptize

1 ['"Gross ist die Diana der Epheser."' First published, with the signature 'Freud', under the rubric 'Varia', *Zbl. Psychoan.*, **2** (1911), 158; reprinted *GW*, **8** (1943), 360. Translation by James Strachey: *SE*, **12**, 342–4 – reprinted here with minor revisions. The material (as is indicated by a note at the end of the German text) is derived from the section on Ephesus in F. Sartiaux, *Villes mortes d'Asie mineure*, Paris, 1911, 62–106.]

2 See also Goethe's poem (*Sophienausgabe*, **2**, 195). [The poem, about an old goldsmith in Ephesus who works on undisturbed by events in the city streets, bears the same title as Freud's paper.]

her, as the Ionic conquerors had done with the goddess Oupis. So it was that the pious artisans and artists of the city became uneasy about their goddess as well as about their earnings. They revolted, and, with endlessly repeated cries of 'Great is Diana of the Ephesians', streamed through the main street, called 'Arcadian', to the theatre, where their leader, Demetrius, delivered an incendiary speech against the Jews and against Paul. The authorities succeeded with difficulty in quelling the tumult by the assurance that the majesty of the goddess was unassailable and out of reach of any attack.[1]

The church founded by Paul at Ephesus did not long remain faithful to him. It came under the influence of a man named John, whose personality has set the critics some hard problems. He may have been the author of the Apocalypse, which teems with invectives against the apostle Paul. Tradition identifies him with the apostle John, to whom the fourth gospel is attributed. According to that gospel, when Jesus was on the cross He called out to His favourite disciple, pointing to Mary: 'Behold thy mother!' And from that moment John took Mary to him. So when John went to Ephesus, Mary accompanied him. Accordingly, alongside of the church of the apostle in Ephesus, there was built the first basilica in honour of the new mother goddess of the Christians. Its existence is attested as early as in the fourth century. Now once again the city had its great goddess, and, apart from her name, there was little change. The goldsmiths, too, recovered their work of making models of the temple and images of the goddess for the new pilgrims. The function of Artemis expressed by the attribute of *Κσνρστρόφσς*,[2] however, was handed over to a St Artemidorus, who took on the care of women in labour.

Then came the conquest of the city by Islam, and finally its ruin and abandonment owing to the river on which it stood becoming choked with sand. But even then the great goddess of Ephesus had not abandoned her claims. In our own days she appeared as a saintly virgin to a pious German girl, Katharina Emmerich, at Dülmen.[3] She described to
[344] her her journey to Ephesus, the furnishings of the house in which she had lived there and in which she had died, the shape of her bed, and so on. And both the house and the bed were in fact found, exactly as the virgin had described them, and they are once more the goal of the pilgrimages of the faithful.

1 *Acts*, xix.

2 ['Rearer of boys.' – The word is misspelt in the 1943 German reprint.]

3 [A town in Westphalia.]

PREFACE TO MAXIM STEINER'S *THE PSYCHICAL DISORDERS OF MALE POTENCY*[1]

(1913)

The author of this little monograph, which deals with the pathology and [345]
treatment of psychical impotence in males, is one of the small band of physicians who early recognized the importance of psychoanalysis for their special branch of medicine and who have never since ceased to perfect themselves in its theory and technique. We are aware that only a small part of neurotic ailments – which we have now come to know as the outcome of disturbances of the sexual function – are dealt with in neuropathology itself. The greater number of them find a place among the disorders of the particular organ which is the victim of a neurotic disturbance. It is therefore expedient and proper that the treatment of these symptoms or syndromes should also be the business of the specialist, who is alone capable of making a differential diagnosis between a neurotic and an organic illness, who can draw the line, in the case of mixed forms, between their organic and neurotic elements, and who can in general give us information on the way in which the two factors in the disease mutually reinforce each other. But if 'nervous' organic diseases are not to fall into neglect as being mere appendages of the material disorders of the same organ – a neglect which, from their frequency and practical importance, they are far from meriting – the specialist, whether he is concerned with the stomach, the heart or the urogenitary system, must, in addition to his general medical knowledge and his specialized attainments, also be able to make use, for his own field of work, of the lines of approach, the discoveries and the techniques of the nerve specialist.

A great therapeutic advance will have been made when specialists no [346]
longer dismiss a patient suffering from a nervous ailment in an organ with a pronouncement such as: 'There's nothing wrong with you; it's simply nerves', or with the not much better further advice: 'Go to a

1 [First published in M. Steiner's *Die psychischen Störungen der männlichen Potenz*, Leipzig and Vienna, 1913, iii–iv; reprinted *GS*, **11** (1928), 247; *Sexualtheorie und Traumlehre* (1931), 239; *GW*, **10** (1946), 451. English translation by James Strachey: *SE*, **12**, 345–6 – reprinted here with minor revisions.]

nerve specialist; he'll order you a light course of cold-water treatment.' No doubt, too, we shall require the specialist in any organ to be capable of understanding and treating nervous disorders in his field, rather than expect the nerve specialist to be trained into being a universal specialist in every organ in which neuroses produce symptoms. And it may accordingly be anticipated that only neuroses with mainly psychical symptoms will remain in the sphere of the nerve specialist.

We may hope, therefore, that the time is not far distant when it will be generally recognized that no sort of nervous disturbance can be understood and treated without the help of the line of approach and often of the technique of psychoanalysis. Such an assertion may sound today like a piece of presumptuous exaggeration; but I venture to prophesy that it is destined to become a platitude. It will, however, always be to the credit of the author of the present work that he has not waited for this to happen before admitting psychoanalysis as a treatment of the nervous ailments within his own specialized branch of medicine.

Vienna, March, 1913

BIBLIOGRAPHY

[Titles of books and periodicals are in italics; titles of papers are in inverted commas. Abbreviations are in accordance with the *World List of Scientific Periodicals* (London, 1963–5). Further abbreviations used in this volume can be found in the List at the end of this bibliography. Numerals in bold type refer to volumes; ordinary numerals refer to pages. In the case of the Freud entries, the letters attached to the dates of publication are in accordance with the corresponding entries in the complete bibliography of Freud's writings in the last volume of the *Revised Standard Edition*.

NOTE ON THE REVISED TRANSLATION

The translations in this *Revised Standard Edition* are supplemented by four sets of notes:

(1) Lengthy commentaries on the English renditions of technical terms that are considered controversial are provided in Volume 24. Usually at the first appearance of each such technical term in each text, but sometimes in other places where the issue seems relevant, the original German word is interpolated in square brackets and a superscript upper-case [T] indicates that the term is discussed in the 24th volume. There (on pp. 55–99) the commentaries appear, in alphabetical order, under the heading 'Notes on the Translation of Some Technical Terms'. If the technical term appears in a derivate form in the text, the root word (as it appears in Volume 24) is provided in the margin. For example, if the interpolated word is the derivative [*überträgt*], the root technical term *Übertragung* appears in the margin.

(2) Shorter commentaries on the English rendition of specific words or phrases appearing in particular places (as opposed to general technical terms) that have attracted comment in the secondary literature are also provided in Volume 24. These minor commentaries are distinguished from those concerning general technical terms by the use of a superscript lower-case [t] in the place where the controversial translation appears. The corresponding set of annotations appears on pp. 105–33 of Volume 24, in chronological order, under the heading 'Annotations to Individual Translations'.

(3) Further interpolations in the translations of German words in square brackets are provided *ad hoc*, without superscript letters, for reasons that should be self-explanatory in each instance. For example, if a technical term which was referenced and discussed in a Note in Volume 24 appears again shortly afterwards in a way that illuminates the points discussed there, then it is silently referenced again. Some of these interpolations might seem odd to German-speaking readers, since no attempt is made to 'adjust' Freud's grammar to conform with the English translation (see the Preface to the Revised Edition, *RSE*, **1**, xxvi *n*. 1). The words in square brackets interpolated in the text are always exactly what Freud wrote.

(4) In a good few places, commentaries (of both types 1 and 2) are also provided in the Editors' introductory notes, appendices and footnotes to the text itself. These are indexed in Volume 24, on pp. 601–6, under the heading 'Notes on Terms and Their Uses'. Such commentaries are usually reserved for matters of translation that are likely to be of interest or value to the general reader, as opposed to those with a special interest in such technical matters.

The pagination of the original *Standard Edition* is provided also in the margins, in square brackets, to assist cross-referencing.

For the reasons explained in the 'Preface to the Revised Edition' (*RSE*, **1**, xxix), all differences between the *SE* and *RSE* are identified through light underscoring of the text. This device was considered necessary to make readers aware of the subtle and pervasive revisions of the translations. The same applies to the revisions of the editorial apparatus. This underscoring will hopefully be removed in later editions of the *RSE*, once the revised edition has become established as the canonical one.

The overarching policy here has been to underscore all differences between the *SE* and *RSE*, with minimal exceptions, in order to ensure transparency. The three categories of exceptions (i.e. the differences that are *not* underscored) are (a) changes that are purely typographical and/or absolutely stereotyped across Volumes 1–23, (b) changes in the location of Freud texts within or between volumes, and (c) all the changes to Volume 24.

The rationale behind (a) is that we wanted to avoid any subjective judgements by the Editor of the *RSE* as to what is and what is not 'significant'. For example, some but not all readers might consider alterations to Strachey's spelling, grammar and punctuation to be trivial, but the potential significance – however subtle – varies with context. The rationale behind (b) is that these changes are indicated in the 'List of Relocated Freud Material in the Revised Edition', which is provided in Volume 24. These changes are also mentioned in the revised (and therefore underscored) editorial notes to the texts themselves. The rationale behind (c) is that the *RSE* version of Volume 24 is so utterly different from the *SE* version that readers can safely consider the volume as a whole to be new.

The following changes were deemed purely typographical and absolutely stereotyped, and are therefore exempted from underscoring:

(1) Changes in type-size, font and spacing (since they are objectively insignificant).

(2) The marginalia – including page numbers – and the superscript ^{T}s and ^{t}s (since they always represent changes).

(3) Changed page numbers in the cross-references and indexes (this follows logically from point 2).

(4) Altered footnote numbers (since new footnotes are always identified by the fact that the notes themselves are underscored, and the knock-on effects for numbering are objectively insignificant).

(5) Changes in running headings (since they repetitively echo changes that are underscored in the main body of text).

(6) Change from the singular possessive 'Editor's' to the plural 'Editors'' (since this applies throughout and follows logically from the fact that, unlike the *SE*, the *RSE* has two editors). In the few instances where the Editor is referred to in the singular, it is always clear from the context whether this means Strachey or Solms or, in the case of Freud (1985*a* [1915]), Grubrich-Simitis.

(7) This preliminary 'Note on the Revised Translation' (since it is obviously added; it applies only to the *RSE*).

(8) Captions to the illustrations (since they always represent changes).

(9) Changes in editorial style (since they are stereotyped and therefore need only be identified once, namely here):

- The word 'and' in two-author citations becomes '&', and a comma is inserted between author name/s and the publication date (e.g. Freud & Breuer, 1895*d*).
- Abbreviations of months (e.g. 'Oct.') and chapters ('Chap.') are spelt out ('October', 'Chapter').
- '*The*' is added to all editorial references to '*Interpretation of Dreams*'.
- Title abbreviations conform to modern usage (e.g. *G.W.* becomes *GW*).
- Punctuation is positioned inside closing quotation marks (e.g. 'The Latin word slipped your memory.').

(10) Modernized hyphenation of words is underscored, but not for those terms that occur very repetitively in the text (since they are stereotyped and the list is limited enough for readers to memorize). Here is the list, which implies also the plural and other grammatical forms of these terms:

anxiety-dream	*becomes*	anxiety dream
anxiety-hysteria	*becomes*	anxiety hysteria
day-dream	*becomes*	daydream
death-wish	*becomes*	death wish
dream-content	*becomes*	dream content
dream-interpretation	*becomes*	dream interpretation
dream-thought	*becomes*	dream thought
ego-cathexis	*becomes*	ego cathexis
ego-libido	*becomes*	ego libido
love-object	*becomes*	love object
object-cathexis	*becomes*	object cathexis
object-choice	*becomes*	object choice
object-libido	*becomes*	object libido
object-love	*becomes*	object love
object-presentation	*becomes*	object presentation
object-relation	*becomes*	object relation
psycho-analysis	*becomes*	psychoanalysis
sound-presentation	*becomes*	sound presentation
super-ego	*becomes*	superego
thing-presentation	*becomes*	thing presentation
to-day	*becomes*	today
wish-fulfilment	*becomes*	wish fulfilment
word-presentation	*becomes*	word presentation

TOTEM AND TABOO

Some Points of Agreement between the Mental Lives of Savages and Neurotics

The present translation is a revised and corrected reprint of the *SE* version, with a new Appendix.

In his Preface Freud tells us that his first stimulus for writing these essays came from the works of Wundt and Jung. Actually, of course, his interest in social anthropology went back much further. In the Fliess correspondence (1950*a*), apart from general allusions to his long-standing devotion to the study of archaeology and prehistory, there are a number of specific references to anthropological topics and to the light which psychoanalysis throws upon them. For instance, in Draft N (May 31, 1897) in discussing the 'horror of incest' he touched upon the relation between the growth of civilization and the suppression of the drives – a subject to which he returned in his paper on '"Civilized" Sexual Morality' (1908*d*), *RSE*, **9**, and, much later, in *Civilization and its Discontents* (1930*a*), ibid., **21**. Again, in Letter 78 (December 12, 1897) he writes: 'Can you imagine what "endopsychic myths" are? They are the latest offspring of my mental labours. The dim inner perception of one's own psychical apparatus stimulates illusions of thought, which are naturally projected outwards and characteristically into the future and the world beyond. Immortality, retribution, life after death, are all reflections of our inner psyche . . . psycho-mythology.' And, in Letter 144 (July 4, 1901): 'Have you read that the English have excavated an old palace in Crete (Knossos) which they declare is the authentic labyrinth of Minos? Zeus seems originally to have been a bull. It seems, too, that our own old God, before
[xi] the sublimation instigated by the Persians took place, was also worshipped as a bull. That provides food for all sorts of thoughts which it is not yet time to set down on paper.' Lastly it is worth mentioning a short passage in a footnote to the first edition of *The Interpretation of Dreams* (1900*a*), near the end of Section B of Chapter V; *RSE*, **4**, 192 *n*. 2, which adumbrates the derivation of the monarchy from the social position of the father of the family.

But the major elements of Freud's contribution to social anthropology made their first appearance in this work, and more especially in the fourth essay, which contains his hypothesis of the primal horde and the killing of the primal father and elaborates his theory tracing from them the origins of almost the whole of later social and cultural institutions. Freud himself had a very high opinion of this last essay both as regards its content and its form. He told James Strachey, probably in 1921, that he regarded it as his best-written work. Nevertheless, Ernest Jones informs us that as late as the middle of June, 1913, when the essay was already in proof and after he had presented it before the Vienna Psychoanalytical Society, he was still expressing doubts and hesitations about publishing it. These doubts were soon removed, however, and the book remained a favourite all through his life and he constantly returned to it. For instance, he summarized and discussed it with particular care in the sixth chapter of his *Autobiographical Study* (1925*d*), ibid., **20**, and he quoted it many times in his last published volume, *Moses and Monotheism* (1939*a*), ibid., **23**.

Freud's own high opinion was shared by Thomas Mann, who wrote in 1929 that *Totem and Taboo* is 'without doubt the one of Freud's productions which has the greatest artistic merit; both in conception and literary form, it is a literary

masterpiece allied to, and comparable with, the greatest examples of literary essays'. Later opinions on the merits of Freud's anthropological arguments themselves, however, have been guarded to say the least (Erdheim, 1991; see also Wallace, 1983).

About the actual composition of the essays which make up this work we have a good deal of information, details of which can be found in the second volume of Ernest Jones's (1955) biography of Freud. Further details can be found in Grubrich-Simitis (1993, 156–66; trans., 117–25) based on her close study of Freud's manuscripts in the Library of Congress, Washington. The large bundle of papers concerning this work is particularly enlightening regarding the genesis and development of the fourth essay. Freud had begun his preparations for the work, and in particular his reading of a large amount of literature on the subject, as early as in 1910. The title 'Totem and Taboo' was evidently already in his mind in August, 1911, though he did not finally adopt it till the essays were collected in volume form. The first essay was finished in mid-January, 1912. It was published in *Imago* in the following March, and was shortly afterwards reprinted, with some small omissions, in the Vienna weekly journal *Pan* (April 11 and 18, 1912) and in the Vienna daily paper *Neues Wiener Journal* (April 18). The second essay was given before the Vienna Psychoanalytical Society on [xii]
May 15, 1912, in a talk which lasted for three hours. The third was prepared during the autumn of 1912 and given before the Vienna Society on January 15, 1913. The fourth was finished on May 12, 1913, and given before the Vienna Society on June 4, 1913.

Totem and Taboo was translated into several languages besides English during Freud's lifetime: into Hungarian (1919), Spanish (1923), Portuguese (n.d.), French (1924), Italian (1930), Japanese (twice, 1930 and 1934) and Hebrew (1939). For the last of these, as can be seen below (p. 9), he wrote a special Preface.

We are indebted to William McGuire for drawing attention to the opening passages of the *Imago* edition (1912) which Freud replaced with a new 'Preface' when *Totem and Taboo* appeared in book form in 1913. These five paragraphs were omitted from all subsequent editions – both German and English. They were republished separately in *GW*, **Nachtr.** in 1987. The first English translation (by Mark Solms) appears below as Appendix A. There are interesting differences between the original opening paragraphs and the subsequent Preface, especially regarding Jung, whose publication in 1911 of the first part of 'Wandlungen und Symbole der Libido' (Jung, 1911–12) was no doubt the main reason why Freud felt forced, as he put it, to publish this work 'prematurely' (p. 149 below). As Freud points out in his 1913 Preface, whereas Jung and his school endeavoured 'to solve the problems of individual psychology with the help of material derived from social psychology', Freud's own intention was just the opposite: 'to dare to try to illuminate what has remained obscure and doubtful in social psychology by means of the insights of psychoanalysis' (p. 148 below).

PREFACE[1]

The four essays that follow were originally published (under a heading which serves as the present book's subtitle) in the first two volumes of *Imago*, a periodical issued under my direction. They represent a first attempt on my part at applying the point of view and the findings of psychoanalysis to some unsolved problems of social psychology [*Völkerpsychologie*]. Thus they offer a methodological contrast on the one hand to Wilhelm Wundt's extensive work, which applies the hypotheses and working methods of *non*-analytic psychology to the same purposes, and on the other hand to the writings of the Zürich school of psychoanalysis, which endeavour, on the contrary, to solve the problems of individual psychology with the help of material derived from social psychology. (Cf. Jung, 1911–12 and 1913.) I readily confess that it was from these two sources that I received the first stimulus for my own essays. [xiii]

I am fully conscious of the deficiencies of these studies. I need not mention those which are necessarily characteristic of pioneering work; but others require a word of explanation. The four essays collected in these pages aim at arousing the interest of a fairly wide circle of educated readers, but they cannot, in fact, be understood and appreciated except by those few who are no longer strangers to the essential nature of psychoanalysis. They seek to bridge the gap between students of such subjects as social anthropology, philology and folklore on the one hand, and psychoanalysts on the other. Yet they cannot offer to either side what each lacks – to the former an adequate initiation into the new psychological technique or to the latter a sufficient grasp of the material that awaits treatment. They must therefore rest content with attracting the attention of the two parties and with encouraging a belief that occasional cooperation between them could not fail to be of benefit to research.

It will be found that the two principal themes from which the title of

1 [This Preface was added in 1913, when the four essays comprising *Totem and Taboo* were published together in book form. The Preface replaces the opening paragraphs of the first essay, which appear here as Appendix A. See Editors' Note, p. 5 above.]

this little book is derived – totems and taboos – have not received the
[xiv] same treatment. The analysis of taboos is put forward as an assured and exhaustive attempt at the solution to the problem. The investigation of totemism does no more than declare that 'here is what psychoanalysis can at the moment contribute towards elucidating the problem of the totem'. The difference is related to the fact that taboos still exist among us. Though expressed in a negative form and directed towards another subject matter, they do not differ in their psychological nature from Kant's 'categorical imperative', which operates in a compulsive fashion and rejects any conscious motives. Totemism, on the contrary, is something alien to our contemporary feelings – a religio-social institution which has been long abandoned as an actuality and replaced with newer forms. It has left only the slightest traces behind it in the religions, man-
Kultur ners and customs of the civilized peoples [*Kulturvölker*][T] of today and has been subject to far-reaching modifications even among the races over which it still holds sway. The social and technical advances in human history have affected taboos far less than the totem.

An attempt is made in this volume to deduce the original meaning of totemism from the vestiges remaining of it in childhood – from the hints of it which emerge in the course of the growth of our own children. The close connection between totems and taboos carries us a step further along the path towards the hypothesis presented in these pages; and if in the end that hypothesis bears a highly improbable appearance, that need be no argument against the possibility of its approximating more or less closely to the reality which it is so hard to reconstruct.

Rome, *September*, 1913

PREFACE TO THE HEBREW TRANSLATION[1]

No reader of [the Hebrew version of] this book will find it easy to put himself in the emotional position of an author who is ignorant of the language of holy writ, who is completely estranged from the religion of his fathers – as well as from every other religion – and who cannot take a share in nationalist ideals, but who has yet never repudiated his people, who feels that he is in his essential nature a Jew and who has no desire to alter that nature. If the question were put to him: 'Since you have abandoned all these common characteristics of your countrymen, what is there left to you that is Jewish?' he would reply: 'A very great deal, and probably its very essence.' He could not now express that essence clearly in words; but some day, no doubt, it will become accessible to the scientific mind. [xv]

Thus it is an experience of a quite special kind for such an author when a book of his is translated into the Hebrew language and put into the hands of readers for whom that historic idiom is a living tongue: a book, moreover, which deals with the origin of religion and morality, though it adopts no Jewish standpoint and makes no exceptions in favour of Jewry. The author hopes, however, that he will be at one with his readers in the conviction that unprejudiced science cannot remain a stranger to the spirit of the new Jewry.

Vienna, *December*, 1930

1 [This Preface was first published in German in *GS*, **12** (1934), 385. It was then stated that a Hebrew translation was about to be published in Jerusalem by Stybel. Actually it was not published there until 1939, by Kirjeith Zefer.]

TOTEM AND TABOO

I
THE HORROR OF INCEST

Prehistoric man, in the various stages of his development, is known to us [1]
through the inanimate monuments and implements which he has left behind, through the information about his art, his religion and his attitude towards life which has come to us either directly or by way of tradition handed down in legends, myths and fairy tales, and through the relics of his mode of thought which survive in our own manners and customs. But apart from this, in a certain sense he is still our contemporary. There are men still living who, as we believe, stand very near to primitive man, far nearer than we do, and whom we therefore regard as his direct heirs and representatives. Such is our view of those whom we describe as savages or half-savages; and their mental life must have a peculiar interest for us if we are right in seeing in it a well-preserved picture of an early stage of our own development.

If that supposition is correct, a comparison between the psychology of primitive peoples, as it is taught by social anthropology, and the psychology of neurotics, as it has been revealed by psychoanalysis, will be bound to show numerous points of agreement and will throw new light upon familiar facts in both sciences.

For external as well as for internal reasons, I shall select as the basis of this comparison the tribes which have been described by anthropologists as the most backward and miserable of savages, the aborigines of Australia, the youngest continent, in whose fauna, too, we can still observe much that is archaic and that has perished elsewhere.

The Australian aborigines are regarded as a distinct race, showing neither physical nor linguistic relationship with their nearest neighbours, the Melanesian, Polynesian and Malayan peoples. They do not build [2]
houses or permanent shelters; they do not cultivate the soil; they keep no

domesticated animals except the dog; they are not even acquainted with the art of making pottery. They live entirely upon the flesh of all kinds of animals which they hunt, and upon roots which they dig. Kings or chiefs are unknown among them; communal affairs are decided by a council of elders. It is highly doubtful whether any religion, in the shape of a worship of higher beings, can be attributed to them. The tribes in the interior of the continent, who have to struggle against the hardest conditions of existence as a result of the scarcity of water, appear to be more primitive in all respects than those living near the coast.

Geschlecht

We should certainly not expect that the sexual life [*Geschlechtsleben*]T of these poor naked cannibals would be moral in our sense or that their sexual drives [*Trieben*]T would be subjected to any great degree of restriction. Yet we find that they set before themselves with the most scrupulous care and the most painful severity the aim of avoiding incestuous sexual relations. Indeed, their whole social organization seems to serve that purpose or to have been brought into relation with its attainment.

Among the Australians the place of all the religious and social institutions which they lack is taken by the system of 'totemism'. Australian tribes fall into smaller divisions, or clans, each of which is named after its totem. What is a totem? It is as a rule an animal (whether edible and harmless or dangerous and feared) and more rarely a plant or a natural phenomenon (such as rain or water), which stands in a peculiar relation to the whole clan. In the first place, the totem is the common ancestor of the clan; at the same time it is their guardian spirit and helper, which sends them oracles and, if dangerous to others, recognizes and spares its own children. Conversely, the clansmen are under a sacred obligation (subject to automatic sanctions) not to kill or destroy their totem and to avoid eating its flesh (or deriving benefit from it in other ways). The totemic character is inherent, not in some individual animal or entity, but in all the individuals of a given class. From time to time festivals are celebrated at which the clansmen represent or imitate the motions and attributes of their totem in ceremonial dances.

[3]

The totem may be inherited either through the female or through the male line. It is possible that originally the former method of descent prevailed everywhere and was only subsequently replaced with the latter. An Australian's relation to his totem is the basis of all his social obligations: it overrides, on the one hand, his tribal membership and, on the other hand, his blood relationships.[1]

1 'The Totem bond is stronger than the bond of blood or family in the modern sense.' (Frazer, 1910, **1**, 53.)

The totem is not attached to one particular place. The clansmen are distributed in different localities and live peacefully side by side with members of other totem clans.[1]

And now we come at last to the characteristic of the totemic system which has attracted the interest of psychoanalysts. In almost every place [4] where we find totems we also find *a law against persons of the same totem having sexual relations with one another and consequently against their marrying*. This, then, is 'exogamy', an institution related to totemism.

Strictly enforced as it is, this prohibition is a remarkable one. There is nothing in the concept or attributes of the totem which I have so far mentioned to lead us to anticipate it; so that it is hard to understand how it has become involved in the totemic system. We cannot, therefore, feel surprised that some investigators actually suppose that exogamy had originally – in the earliest times and in its true meaning – nothing to do with totemism, but became attached to it (without there being any underlying connection) at some time when marriage restrictions became

1 This highly condensed summary of the totemic system must necessarily be subject to further comments and qualifications. The word 'totem' was first introduced in 1791 (in the form 'totam') from the North American Indians by an Englishman, J. Long. The subject itself has gradually attracted great scientific interest and has produced a copious literature, from which I may select as works of capital importance J. G. Frazer's four-volume *Totemism and Exogamy* (1910) and the writings of Andrew Lang, e.g. *The Secret of the Totem* (1905). The merit of having been the first to recognize the importance of totemism for human prehistory lies with a Scotsman, John Ferguson McLennan (1869–70). Totemic institutions were, or still are, to be observed in operation, not only among the Australians, but also among the North American Indians, among the peoples of Oceania, in the East Indies and in a large part of Africa. It may also be inferred from certain vestigial remains, for which it is otherwise hard to account, that totemism existed at one time among the Aryan and Semitic aboriginal races of Europe and Asia. Many investigators are therefore inclined to regard it as a necessary phase of human development which has been passed through universally.

How did prehistoric men come to adopt totems? How, that is, did they come to make the fact of their being descended from one animal or another the basis of their social obligations and, as we shall see presently, of their sexual restrictions? There are numerous theories on the subject – of which Wundt (1906, [264 ff.]) has given an epitome for German readers – but no agreement. It is my intention to devote a special study before long to the problem of totemism, in which I shall attempt to solve it by the help of a psychoanalytic line of approach. (See the fourth essay in this work.)

Not only, however, is the *theory* of totemism a matter of dispute; the facts themselves are scarcely capable of being expressed in general terms as I have tried to do in the text above. There is scarcely a statement which does not call for exceptions or contradictions. But it must not be forgotten that even the most primitive and conservative races are in some sense *ancient* races and have a long past history behind them during which their original conditions of life have been subject to much development and distortion. So it comes about that in those races in which totemism exists today, we may find it in various stages of decay and disintegration or in the process of transition to other social and religious institutions, or again in a stationary condition which may differ greatly from the original one. The difficulty in this last case is to decide whether we should regard the present state of things as a true picture of the significant features of the past or as a secondary distortion of them.

necessary. However this may be, the bond between totemism and exogamy exists and is clearly a very firm one.

Some further considerations will make the significance of this prohibition clearer:

(*a*) The violation of the prohibition is not left to what might be called the 'automatic' punishment of the guilty parties, as in the case of other totem prohibitions, such as that against killing the totem animal. It is avenged in the most energetic fashion by the whole clan, as though it were a question of averting some danger that threatened the whole community or some guilt that was pressing upon it. A few sentences from Frazer (1910, **1**, 54) will show how severely such misdeeds are treated by savages who are otherwise far from being moral by our standards:

[5] 'In Australia the regular penalty for sexual intercourse with a person of a forbidden clan is death. It matters not whether the woman be of the same local group or has been captured in war from another tribe; a man of the wrong clan who uses her as his wife is hunted down and killed by his clansmen, and so is the woman; though in some cases, if they succeed in eluding capture for a certain time, the offence may be condoned. In the Ta-ta-thi tribe, New South Wales, in the rare cases which occur, the man is killed but the woman is only beaten or speared, or both, till she is nearly dead; the reason given for not actually killing her being that she was probably coerced. Even in casual amours the clan prohibitions are strictly observed; any violations of these prohibitions "are regarded with the utmost abhorrence and are punished by death".' [Quoted from Cameron (1885, 351).]

(*b*) Since the same severe punishment is inflicted in the case of passing love affairs which have not resulted in any children, it seems unlikely that the reasons [*Motive*]^{T} for the prohibition are of a practical nature.

(*c*) Since totems are hereditary and not changed by marriage, it is easy to follow the consequences of the prohibition. Where, for instance, descent is through the female line, if a man of the Kangaroo totem marries a woman of the Emu totem, all the children, both boys and girls, belong to the Emu clan. The totem regulation will therefore make it impossible for a son of this marriage to have incestuous intercourse with his mother or sisters, who are Emus like himself.[1]

1 On the other hand, at all events so far as this prohibition is concerned, the father, who is a Kangaroo, is free to commit incest with his daughters, who are Emus. If the totem descended through the *male* line, however, the Kangaroo father would be prohibited from incest with his daughters (since all his children would be Kangaroos), whereas the son would be free to commit incest with his mother. These implications of totem prohibitions suggest that descent through the female line is older than that through the male, since there are grounds for thinking that totem prohibitions were principally directed against the incestuous desires of the son.

(*d*) But a little more reflection will show that exogamy linked with the totem effects more (and therefore *aims* at more) than the prevention of incest with a man's mother and sisters. It makes sexual intercourse impossible for a man with all the women of his own clan (that is to say [6] with a number of women who are not his blood relatives) by treating them all as though they *were* his blood relatives. It is difficult at first sight to see the psychological justification for this very extensive restriction, which goes far beyond anything comparable among civilized peoples. It may be gathered from this, however, that the part played by the totem as common ancestor is taken very seriously. All those who are descended from the same totem are blood relations. They form a single family, and within that family even the most distant degree of kinship is regarded as an absolute hindrance to sexual intercourse.

We see, then, that these savages have an unusually great horror of incest, or are sensitive on the subject to an unusual degree, and that they combine this with a peculiarity which remains obscure to us – of replacing real blood relationship with totem kinship. This latter contrast must not, however, be too much exaggerated, and we must remember that the totem prohibitions include that against real incest as a special case.

The riddle of how it came about that the real family was replaced with the totem clan must perhaps remain unsolved till the nature of the totem itself can be explained. At the same time, it is to be observed that if there were a certain degree of freedom of sexual intercourse outside marriage, blood relationship, and consequently the prevention of incest, would become so uncertain that the prohibition would stand in need of a wider basis. It is therefore worth remarking that Australian customs permit the occurrence, in certain social situations and during certain festivals, of breaches in a man's exclusive conjugal rights over a woman.

Linguistic usage in these Australian tribes[1] exhibits a peculiarity which is no doubt relevant here. For the terms used by them to express the various degrees of kinship do not denote a relation between two individuals but between an individual and a group [*Gruppe*][T]. This is what L. H. Morgan [1877] named the 'classificatory' system of relationship. Thus a man uses the term 'father' not only for his actual procreator but also for all the other men whom his mother might have married according to tribal law and who therefore might have procreated him; he uses the [7] term 'mother' not only for the woman who actually bore him but also for all the other women who might have borne him without transgressing the tribal law; he uses the terms 'brother' and 'sister' not only for the

1 As well as in most other totemic communities.

children of his actual parents but also for the children of all those persons who stand in the relation of parents to him in the classificatory sense; and so on. Thus the kinship terms which two Australians apply to each other do not necessarily indicate any consanguinity, as ours would do: they represent social rather than physical relationships. Something approaching the classificatory system is to be found among us when, for instance, children are encouraged to refer to all their parents' friends as 'Uncle' or 'Aunt', or when we speak in a metaphorical sense of 'brothers in Apollo' or 'sisters in Christ'.

Though this use of words strikes us as so puzzling, it is easily explained if we look on it as a survival of the marriage institution which the Rev. L. Fison has called 'group marriage' and which consists in a certain number of men exercising conjugal rights over a certain number of women. The children of such a group marriage would then justly regard one another as brothers and sisters (though they were not all born of the same mother) and would regard all the men in the group as their fathers.

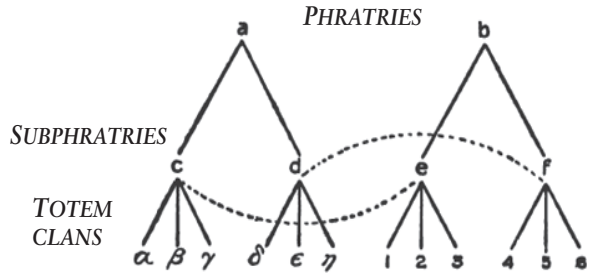
Though some authors, such as Westermarck (1901), have disputed the conclusions which others have drawn from the existence of the classificatory system of relationship, those who have the closest acquaintance with the Australian natives are agreed in regarding that system as a survival from the days of group marriage. Indeed, according to Spencer & Gillen (1899, [64]), a certain form of group marriage exists to this day in the Urabunna and Dieri tribes. Group marriage thus preceded individual marriage among these peoples, and after its disappearance left definite traces behind both in language and customs.

But when once we have put group marriage in the place of individual marriage, the apparently excessive degree of avoidance of incest which we have come across among the same peoples becomes intelligible. Totemic exogamy, the prohibition of sexual intercourse between members of the same clan, appears to have been the appropriate means for
[8] preventing group incest; it thus became established and persisted long after its raison d'être had ceased.

It may seem that we have thus discovered the motives that led the Australian natives to set up their marriage restrictions; but we have now to learn that the actual state of affairs reveals a far greater, and at first sight a bewildering, complexity. For there are few races in Australia in which the totem barrier is the sole prohibition. Most of them are organized in such a way as to fall into two divisions, known as marriage classes or 'phratries'. Each of these phratries is exogamous and comprises a number of totem clans. As a rule each phratry is further subdivided into

two 'subphratries', the whole tribe being thus divided into four, with the subphratries intermediate between the phratries and the totem clans.

The following diagram represents the typical organization of an Australian tribe and corresponds to the actual situation in a very large number of cases:



Here the twelve totem clans are divided into four subphratries and two phratries. All the divisions are exogamous.[1] Subphratries c and e form an exogamous unit; and so also do subphratries d and f. The result (and therefore the purpose) of these arrangements cannot be doubted: they bring about a still further restriction on the choice of marriage and on sexual liberty. Let us suppose that each clan contains an equal number of members. Then, if only the twelve totem clans existed, each member of a clan would have his choice among $^{11}/_{12}$ of all the women in the tribe. The existence of the two phratries reduces his choice to $^{6}/_{12}$ or $^{1}/_{2}$, for then a man of totem α can only marry a woman of totems 1 to 6. With the introduction of the four subphratries his choice is still further reduced to $^{3}/_{12}$ or $^{1}/_{4}$, for in that case a man of totem α is restricted in his choice of a [9]
wife to a woman of totems 4, 5 or 6.

The historical relation between the marriage classes (of which in some tribes there are as many as eight) and the totem clans is completely obscure. It is merely evident that these arrangements are directed towards the same aim as totemic exogamy and pursue it still further. While, however, totemic exogamy gives one the impression of being a sacred ordinance of unknown origin – in short, of being a custom – the complicated institution of the marriage classes, with their subdivisions and the regulations attaching to them, look more like the result of deliberate legislation, which may perhaps have taken up the task of preventing incest afresh because the influence of the totem was waning. And, while the totemic system is, as we know, the basis of all the other social obligations and moral restrictions of the tribe, the significance of the phratries seems in general not to extend beyond the regulation of marriage choice which is its aim.

1 The number of totems is chosen arbitrarily.

The system of marriage classes in its furthest developments bears witness to an endeavour to go beyond the prevention of natural and group incest and to forbid marriage between still more distant groups of relatives. In this it resembles the Catholic Church, which extended the ancient prohibition against marriage between brothers and sisters to marriage between cousins and even to marriage between those who were merely spiritual relatives [godfathers, godmothers and godchildren]. (Cf. Lang, 1910–11, [87].)

It would be little to our purpose if we were to follow in detail the extraordinarily involved and obscure discussions on the origin and significance of the marriage classes and on their relation to the totem. For our purpose it is enough to draw attention to the great care which is devoted by the Australians, as well as by other savage peoples, to the prevention of incest.[1] It must be admitted that these savages are even more sensitive on the subject of incest than we are. They are probably liable to a greater temptation to it and for that reason stand in need of fuller protection.

[10] But the horror of incest shown by these peoples is not satisfied by the erection of the institutions which I have described and which seem to be directed principally against group incest. We must add to them a number of 'customs' which regulate the dealings of individuals with their near relatives in our sense of the term, customs which are enforced literally with religious strictness and the purpose of which can scarcely be doubted. These customs or customary prohibitions have been termed 'avoidances'. They extend far beyond the totemic races of Australia; but once again I must ask my readers to be content with a fragmentary extract from the copious material.

In Melanesia restrictive prohibitions of this sort govern a boy's intercourse with his mother and sisters. Thus, for instance, in Lepers' Island, one of the New Hebrides, when a boy has reached a certain age he no longer lives at home, but takes up his quarters in the 'clubhouse', where he now regularly eats and sleeps. It is true that he may still go to his father's house to ask for food, but if his sister is at home he must go away before eating; if no sister is there he may sit down near the door and eat. If by chance a brother and sister meet in the open, she must run away or hide. If a boy knows that certain footprints in the road are his sister's, he will not follow them, nor will she follow his. Indeed, he will not even utter her name, and will avoid the use of a common word if it forms part of her name. This avoidance begins with the puberty ceremonies and is

1 Storfer (1911, [16]) has quite recently insisted on this point.

maintained throughout life. The reserve between a son and his mother increases as the boy grows up and is much more on her side than on his. If his mother brings him food, she does not give it him but puts it down for him to take. In speaking to him she does not *tutoyer* him, but uses the more distant plural forms.[1]

Similar customs prevail in New Caledonia. If a brother and sister happen to meet on a path, the sister will throw herself into the bushes and he will pass on without turning his head.[2]

Among the natives of the Gazelle Peninsula in New Britain a sister, after her marriage, is not allowed to converse with her brother; she never utters his name, but designates him by a circumlocution.[3]

In New Mecklenburg cousins of one kind are subject to similar restrictions, as are brothers and sisters. They may not come near each other, may not shake hands and may not give each other presents; but they are allowed to speak to each other at a distance of some paces. The penalty for incest with a sister is death by hanging.[4] [11]

In Fiji these avoidance rules are particularly strict; they affect not only blood sisters but tribal sisters as well. It must strike us as all the more puzzling to hear that these same savages practise sacred orgies, in which precisely these forbidden degrees of kinship seek sexual intercourse – puzzling, that is, unless we prefer to regard the contrast as an explanation of the prohibition.[5]

Among the Battas of Sumatra the rules of avoidance apply to all near relations. 'A Batta, for example, would think it shocking were a brother to escort his sister to an evening party. Even in the presence of others a Batta brother and sister feel embarrassed. If one of them comes into the house, the other will go away. Further, a father may never be alone in the house with his daughter, nor a mother with her son. . . . The Dutch missionary who reports these customs adds that he is sorry to say that from what he knows of the Battas he believes the maintenance of most of these rules to be very necessary.' These people assume as a matter of course that a solitary meeting between a man and a woman will lead to an improper intimacy between them. And since they believe that intercourse between near relations will lead to punishments and calamities of all sorts, they are right to avoid any temptation to transgress these prohibitions.[6]

1 Frazer (1910, **2**, 77 f.), quoting Codrington (1891, [232]).

2 [Frazer (1910, **2**, 78), quoting Lambert (1900, 114).]

3 Frazer (1910, **2**, 124) [quoting Parkinson (1907, 67 f.)].

4 Frazer (1910, **2**, 130 f.), quoting Peckel (1908, [467]).

5 Frazer (1910, **2**, 146 ff.), quoting Fison [1885, 27 ff.].

6 Frazer (1910, **2**, 189) [quoting Joustra (1902, 391 f.)].

Curiously enough, among the Barongo of Delagoa Bay, in South Africa, the strictest rules affect a man's relations with his sister-in-law, the wife of his wife's brother. If he meets this formidable person anywhere, he carefully avoids her. He does not eat out of the same dish with her, he speaks to her with embarrassment, does not venture into her hut and greets her in a trembling voice.[1]

[12] A rule of avoidance with which one would have expected to meet more frequently operates among the A-kamba (or Wa-kamba) of British East Africa. A girl has to avoid her father between the age of puberty and the time of her marriage. If they meet in the road, she hides while he passes, and she may never go and sit near him. This holds good until the moment of her betrothal. After her marriage she does not avoid her father in any way.[2]

By far the most widespread and strictest avoidance (and the most interesting from the point of view of civilized races) is that which restricts a man's intercourse with his mother-in-law. It is quite general in Australia and also extends over Melanesia, Polynesia and the Negro races of Africa, wherever traces of totemism and the classificatory system of relationship are found and probably still further. In some of these places there are similar prohibitions against a woman having innocent intercourse with her father-in-law; but they are far less usual and severe. In a few isolated cases both parents-in-law are subject to avoidance. Since we are less concerned with the ethnographical extent of this avoidance than with its substance and purpose, I shall once again restrict myself to quoting a few examples.

Among the Melanesians of the Banks' Islands 'these rules of avoidance are very strict and minute. A man will not come near his wife's mother and she will not come near him. If the two chance to meet in a path, the woman will step out of it and stand with her back turned till he has gone by, or perhaps, if it be more convenient, he will move out of the way. At Vanua Lava, in Port Patteson, a man would not even follow his mother-in-law along the beach until the rising tide had washed her footprints from the sand. Yet a man and his mother-in-law may talk to each other at a distance; but a woman will on no account mention the name of her daughter's husband, nor will he name hers.'[3]

In the Solomon Islands, after his marriage a man may neither see nor

1 Frazer (1910, **2**, 388), quoting Junod [1898, 73 ff.].

2 Frazer (1910, **2**, 424) [quoting C. W. Hobley (unpublished MS.)].

3 Frazer (1910, **2**, 76) [quoting Codrington (1891, 42 ff.)].

converse with his mother-in-law. If he meets her, he may not recognize her, but must make off and hide himself as fast as he can.[1]

Among the Zulu Bantu 'custom requires that a man should "be [13] ashamed of" his wife's mother, that is to say, he must studiously shun her society. He may not enter the same hut with her, and if by chance they meet on a path, one or other turns aside, she perhaps hiding behind a bush, while he screens his face with a shield. If they cannot thus avoid each other, and the mother-in-law has nothing else to cover herself with, she will tie a wisp of grass round her head as a token of ceremonial avoidance. All correspondence between the two has to be carried on either through a third party or by shouting to each other at a distance with some barrier, such as the kraal fence, interposed between them. They may not even pronounce each other's proper name.' (Frazer, 1910, **2**, 385.)

Among the Basoga, a Bantu people who live in the region of the sources of the Nile, a man may only speak to his mother-in-law when she is in another room and out of sight. Incidentally, these people have such a horror of incest that they punish it even when it occurs among their domestic animals. (Frazer, 1910, **2**, 461.)

While there can be no doubt as to the purpose and significance of the other avoidances between near relations, and they are universally regarded as protective measures against incest, the prohibitions affecting a man's intercourse with his mother-in-law have received another interpretation in some quarters. It was with justice regarded as incomprehensible that all these different peoples should feel such great fear of the temptation presented to a man by an elderly woman, who might have been, but in fact was not, his mother. (Crawley, 1902, 405.)

This objection was also raised against the view put forward by Fison [Fison & Howitt, 1880, 104]. He pointed out that certain systems of marriage classes had gaps in them, as a result of which marriage between a man and his mother-in-law was not theoretically impossible. For that reason, he suggested, a special guarantee against that possibility became necessary.

Sir John Lubbock (1870, [84 f.]) traced back the attitude of a mother-in-law to her son-in-law to the institution of 'marriage by capture'. 'When the capture was a reality', he writes, 'the indignation of the parents would also be real; when it became a mere symbol, the parental anger would be symbolized also, and would be continued even after its origin was [14]

1 Frazer (1910, **2**, 117), quoting Ribbe (1903, [140 f.]).

forgotten.' Crawley [1902, 406] has no difficulty in showing how insufficiently this attempted explanation covers the details of the observed facts.

Tylor [1889, 246 f.] believes that the treatment given to a son-in-law by his mother-in-law is merely a form of 'cutting' or non-recognition by the wife's family: the man is regarded as an 'outsider' until the first child is born. In the first place, however, the prohibition is not always brought to an end when this occurs. But, apart from this, it may be objected that this explanation throws no light on the fact that the prohibition centres particularly on the *mother*-in-law – that the explanation overlooks the factor of sex. Moreover, it takes no account of the attitude of religious horror expressed in the prohibition. (Crawley, 1902, 407.)

A Zulu woman, questioned as to the basis of the prohibition, gave the sensitive reply: 'It is not right that he should see the breasts which suckled his wife.'[1]

As we know, the relation between son-in-law and mother-in-law is also one of the delicate points of family organization in *civilized* communities. That relation is no longer subject to rules of avoidance in the social system of the white peoples of Europe and America; but many disputes and much unpleasantness could often be eliminated if the avoidance still existed as a custom and did not have to be re-erected by individuals. It may be regarded by some Europeans as an act of high wisdom on the part of these savage races that by their rules of avoidance they entirely precluded any contact between two persons brought into this close relationship to each other. There is scarcely room for doubt that something in the psychological relation of a mother-in-law to a son-in-law breeds hostility between them and makes it hard for them to live together. But the fact that in civilized societies mothers-in-law are such a favourite subject for jokes seems to me to suggest that the emotional relation involved includes sharply contrasted components. I believe, that is, that this relation is, in fact, an 'ambivalent' one, composed of conflicting affectionate and hostile impulses [*Regungen*][T].

Some of those impulses are obvious enough. On the side of the mother-
[15] in-law there is reluctance to give up the possession of her daughter, distrust of the stranger to whom she is to be handed over, an impulse to retain the dominating position which she has occupied in her own house. On the man's side there is a determination not to submit any longer to someone else's will, jealousy of anyone who possessed his

1 Crawley (1902, 401), quoting Leslie (1875, [141]).

wife's affection before he did, and, last but not least,[1] an unwillingness to allow anything to interfere with the illusory overvaluation bred of his sexual feelings. The figure of his mother-in-law usually causes such an interference, for she has many features which remind him of her daughter and yet lacks all the charms of youth, beauty and spiritual freshness which endear his wife to him.

But we are able to bring forward other motives than these, thanks to the knowledge of concealed mental impulses [*Seelenregungen*][T] which we have acquired from the psychoanalytic examination of individual human beings. A woman whose psychosexual needs should find satisfaction in her marriage and her family life is often threatened with the danger of being left unsatisfied, because her marriage relation has come to a premature end and because of the uneventfulness of her emotional life. A mother, as she grows older, saves herself from this by putting herself in her children's place, by identifying herself with them; and this she does by making their emotional experiences her own. Parents are said to stay young with their children, and that is indeed one of the most precious psychological gains that parents derive from their children. Where a marriage is childless, the wife has lost one of the things which might be of most help to her in tolerating the resignation that her own marriage demands from her. A mother's sympathetic identification [*Einfühlung*][T] with her daughter can easily go so far that she herself falls in love with the man her daughter loves; and in glaring instances this may lead to severe forms of neurotic illness as a result of her violent mental struggles against this emotional situation. In any case, it very frequently happens that a mother-in-law is subject to an *impulse* to fall in love in this way, and this impulse itself or an opposing trend are added to the tumult of conflicting forces [*Kräfte*][T] in her mind. And very often the unkind, sadistic components of her love are directed on to her son-in-law in order that the forbidden, affectionate ones may be the more severely suppressed. *Seele*

A man's relation to his mother-in-law is complicated by similar impulses, though they have another source. It is regularly found that he chose his mother as the object of his love, and perhaps his sister as well, before passing on to his final choice. Because of the barrier that exists against incest, his love is deflected from the two figures on whom his affection was centred in his childhood on to an outside object that is modelled upon them. The place of his own and his sister's mother is taken by his mother-in-law. He has an impulse to fall [16]

1 [This phrase is in English in the original.]

back upon his original choice, though everything in him fights against it. His horror of incest insists that the genealogical history of his choice of an object for his love shall not be recalled. His repudiation of this impulse is also facilitated by the fact that his mother-in-law is only a contemporary figure; he has not known her all his life, so that there is no unchangeable picture of her preserved in his unconscious. A streak of irritability and malevolence that is apt to be present in the medley of his feelings leads us to suspect that she does, in fact, offer him a temptation to incest; and this is confirmed by the not uncommon event of a man openly falling in love with the woman who is later to be his mother-in-law before transferring his love to her daughter.

I can see nothing against the presumption that it is precisely this incestuous factor in the relation that provides savages with the motive for their rules of avoidance between son-in-law and mother-in-law. Thus the explanation which we should adopt for these strictly enforced avoidances among primitive peoples is that put forward by Fison [see p. 21 above], which regards them merely as a further protection against possible incest. The same explanation holds good of all other avoidances, between both blood and tribal relations. The only difference would be that in the case of blood relations the possibility of incest is an immediate one and the intention to prevent it may be conscious; in the other cases, including that of a man's relation to his mother-in-law, the possibility of incest would seem to be a temptation in phantasy
Phantasie [*Phantasieversuchung*][T] set in motion through the agency of unconscious connecting links.

There has been little opportunity in the preceding pages for showing how new light can be thrown upon the facts of social psychology by the
[17] adoption of a psychoanalytic method of approach: for the horror of incest displayed by savages has long been recognized as such and stands in need of no further interpretation. All that I have been able to add to our understanding of it is to emphasize the fact that it is essentially an *infantile* feature and that it reveals a striking agreement with the mental life of neurotic patients. Psychoanalysis has taught us that a boy's earliest choice of objects for his love is incestuous and that those objects are forbidden ones – his mother and his sister.[1] We have learnt, too, the manner in which, as he grows up, he liberates himself from this incestuous

1 [This topic was first discussed at length by Freud in the third of his *Three Essays* (*RSE*, 7, 198 ff.).]

attraction. A neurotic, on the other hand, invariably exhibits some degree of psychical infantilism. He has either failed to get free from the psychosexual conditions that prevailed in his childhood or he has returned to them – two possibilities which may be summed up as developmental inhibition and regression. Thus incestuous fixations of libido continue to play (or begin once more to play) the principal part in his unconscious mental life. We have arrived at the point of regarding a child's relation to his parents, dominated as it is by incestuous longings, as the *nuclear complex* of neurosis. This revelation of the importance of incest in neurosis is naturally received with universal scepticism by adults and normal people. Similar expressions of disbelief, for instance, inevitably greet the writings of Otto Rank [e.g. 1907 and 1912*c*], which have brought more and more evidence to show the extent to which the interest of creative writers centres round the theme of incest and how the same theme, in countless variations and distortions, provides the subject matter of poetry. We are driven to believe that this rejection is principally a product of the distaste which human beings feel for their early incestuous wishes, now overtaken by repression [*Verdrängung*][T]. It is therefore of no small importance that we are able to show that these same incestuous wishes, which are later destined to become unconscious, are still regarded by savage peoples as immediate perils against which the most severe measures of defence [*Abwehrmassregeln*] must be enforced. *Abwehr*

II
TABOO AND EMOTIONAL AMBIVALENCE

(1)

[18] 'Taboo' is a Polynesian word. It is difficult for us to find a translation for it, since the concept connoted by it is one which we no longer possess. It was still current among the ancient Romans, whose '*sacer*' was the same as the Polynesian 'taboo'. So, too, the '*ἅγος*' of the Greeks and the '*kadesh*' of the Hebrews must have had the same meaning as is expressed in 'taboo' by the Polynesians and in analogous terms by many other races in America, Africa (Madagascar) and North and Central Asia.

The meaning of 'taboo', as we see it, diverges in two contrary directions. To us it means, on the one hand, 'sacred', 'consecrated', and on the other 'uncanny' [*unheimlich*], 'dangerous', 'forbidden', 'unclean'. The converse of 'taboo' in Polynesian is '*noa*', which means 'common' or 'generally accessible'. Thus 'taboo' has about it a sense of something unapproachable, and it is principally expressed in prohibitions and restrictions. Our collocation 'holy dread' would often coincide in meaning with 'taboo'.

Taboo restrictions are distinct from religious or moral prohibitions. They are not based upon any divine ordinance, but may be said to impose themselves on their own account. They differ from moral prohibitions in that they fall into no system that declares quite generally that certain abstinences must be observed and gives reasons for that necessity. Taboo prohibitions have no grounds and are of unknown origin. Though they are unintelligible to *us*, to those who are dominated by them they are taken as a matter of course.

Wundt (1906, 308) describes taboo as the oldest human unwritten code of laws. It is generally supposed that taboo is older than gods and dates back to a period before any kind of religion existed.

[19] Since we need an impartial account of taboo to submit to psychoanalytic examination, I shall now give some extracts and summaries of portions of the article 'Taboo' in the *Encyclopaedia Britannica* (1910–11),[1] the author of which was Northcote W. Thomas, the anthropologist.

1 This includes a bibliography of the chief literature on the subject.

'Properly speaking taboo includes only (*a*) the sacred (or unclean) character of person or things, (*b*) the kind of prohibition which results from this character, and (*c*) the sanctity (or uncleanness) which results from a violation of the prohibition. The converse of taboo in Polynesia is *noa* and allied forms, which mean "general" or "common". . . .

'Various classes of taboo in the wider sense may be distinguished: (i) natural or direct, the result of *mana* (mysterious power) inherent in a person or thing; (ii) communicated or indirect, equally the result of *mana*, but (*a*) acquired or (*b*) imposed [*übertragen*] by a priest, chief or other person; (iii) intermediate, where both factors are present, as in the appropriation of a wife to her husband. . . .' The term is also applied to other ritual restrictions, but what is better described as a 'religious interdiction' should not be referred to as taboo.

'The objects of taboo are many: (i) direct taboos aim at (*a*) the protection of important persons – chiefs, priests, etc. – and things against harm; (*b*) the safeguarding of the weak – women, children and common people generally – from the powerful *mana* (magical influence) of chiefs and priests; (*c*) the provision against the dangers incurred by handling or coming in contact with corpses, by eating certain foods, etc.; (*d*) the guarding of the chief acts of life – birth, initiation, marriage and sexual functions, etc., against interference; (*e*) the securing of human beings against the wrath or power of gods and spirits;[I] (*f*) the securing of unborn infants and young children, who stand in a specially sympathetic relation with one or both parents, from the consequences of certain actions, and more especially from the communication of qualities supposed to be derived from certain foods. (ii) Taboos are imposed in order to secure against thieves the property of an individual, his fields, tools, etc. . . .' [20]

The punishment for the violation of a taboo was no doubt originally left to an internal, automatic agency: the violated taboo itself took vengeance. When, at a later stage, ideas [*Vorstellungen*][T] of gods and spirits arose, with whom taboo became associated, the penalty was expected to follow automatically from the divine power. In other cases, probably as a result of a further evolution of the concept, society itself took over the punishment of offenders, whose conduct had brought their fellows into danger. Thus the earliest human penal systems may be traced back to taboo.

'The violation of a taboo makes the offender himself taboo. . . .' Certain of the dangers brought into existence by the violation may be averted by acts of atonement and purification.

1 In the present context this use of the term 'taboo' may be disregarded as not being a primary one.

The source of taboo is attributed to a peculiar magical power which is inherent in persons and spirits and can be conveyed by them through the medium of inanimate objects. 'Persons or things which are regarded as taboo may be compared to objects charged with electricity; they are the seat of a tremendous power which is transmissible by contact, and may be liberated with destructive effect if the organisms which provoke its discharge [*Entladung*][T] are too weak to resist it; the result of a violation of a taboo depends partly on the strength of the magical influence inherent in the taboo object or person, partly on the strength of the opposing *mana* of the violator of the taboo. Thus, kings and chiefs are possessed of great power, and it is death for their subjects to address them directly; but a minister or other person of greater *mana* than common can approach them unharmed, and can in turn be approached by their inferiors without risk. . . . So too indirect taboos depend for their strength on the *mana* of him who imposes them; if it is a chief or a priest, they are more powerful than those imposed by a common person. . . .'

entladen

It is no doubt the transmissibility of taboo which accounts for the attempts to throw it off by suitable purificatory ceremonies.

Taboos may be permanent or temporary. Among the former are those attaching to priests and chiefs, as well as to dead persons and anything belonging to them. Temporary taboos may be attached to certain particular states, such as menstruation and childbirth, to warriors before and after an expedition, or to special activities such as fishing and hunting. A general taboo may (like a Papal Interdict) be imposed upon a whole region and may then last for many years.

[21]

If I judge my readers' feelings aright, I think it is safe to say that in spite of all that they have now heard about taboo they still have very little idea of the meaning of the term or of what place to give it in their thoughts. This is no doubt due to the insufficiency of the information I have given them and to my having omitted to discuss the relation between taboo and superstition, the belief in spirits [*Seelenglauben*], and religion. On the other hand, I am afraid a more detailed account of what is known about taboo would have been even more confusing, and I can assure them that in fact the whole subject is highly obscure.

What we are concerned with, then, is a number of prohibitions to which these primitive races are subjected. Every sort of thing is forbidden; but they have no idea why, and it does not occur to them to raise the question. On the contrary, they submit to the prohibitions as though they were a matter of course and feel convinced that any violation of them will be

automatically met with the direst punishment. We have trustworthy stories of how any unwitting violation of one of these prohibitions is in fact automatically punished. An innocent wrongdoer, who may, for instance, have eaten a forbidden animal, falls into a deep depression, anticipates death and then dies in real earnest. These prohibitions are mainly directed against liberty of enjoyment and against freedom of movement and communication. In some cases they have an intelligible meaning and are clearly aimed at abstinences and renunciations. But in other cases their subject matter is quite incomprehensible; they are concerned with trivial details and seem to be of a purely ceremonial nature.

Behind all these prohibitions there seems to be something in the nature of a theory that they are necessary because certain persons and things are charged with a dangerous power, which can be transferred through contact with them, almost like an infection. The *quantity* of this dangerous attribute also plays a part. Some people or things have more of it than others and the danger is actually proportional to the difference of potential of the charges. The strangest fact seems to be that anyone [22] who has transgressed one of these prohibitions himself acquires the characteristic of being prohibited – as though the whole of the dangerous charge had been transferred over to him. This power is attached to all *special* individuals, such as kings, priests or newborn babies, to all *exceptional* states, such as the physical states of menstruation, puberty or birth, and to all *uncanny* things, such as sickness and death and what is associated with them through their power of infection or contagion.

The word 'taboo' denotes everything, whether a person or a place or a thing or a transitory condition, which is the vehicle or source of this mysterious attribute. It also denotes the prohibitions arising from the same attribute. And, finally, it has a connotation which includes alike 'sacred' and 'above the ordinary', as well as 'dangerous', 'unclean' and 'uncanny'.

This word and the system denoted by it give expression to a group of mental attitudes and ideas which seem remote indeed from our understanding. In particular, there would seem to be no possibility of our coming into closer contact with them without examining the belief in ghosts and spirits which is characteristic of these low levels of culture.

Why, it may be asked at this point, should we concern ourselves at all with this riddle of taboo? Not only, I think, because it is worthwhile trying to solve *any* psychological problem for its own sake, but for other reasons as well. It may begin to dawn on us that the taboos of the savage Polynesians are after all not so remote from us as we were inclined to

think at first, that the moral and conventional prohibitions by which we ourselves are governed may have some essential relationship with these primitive taboos and that an explanation of taboo might throw a light upon the obscure origin of our own 'categorical imperative'.

Accordingly, we shall be particularly interested to hear the views [*Auffassung*][T] of so notable an investigator as Wilhelm Wundt on the subject of taboo, especially as he promises 'to trace back the concept of taboo to its earliest roots' (1906, 301).

[23] Wundt writes of that concept that 'it comprises all of the usages in which is expressed a dread of certain objects related to cult ideas or of actions connected with them'. (Ibid., 237.) And, in another passage: 'If we understand by it [taboo], in accordance with the general meaning of the word, every prohibition (whether laid down in usage or custom or in explicitly formulated laws) against touching an object or making use of it for one's own purposes or against using certain proscribed words . . .' then, he goes on, there can be no race and no level of culture which has escaped the ill-effects of taboo. [Ibid., 301.]

Wundt next proceeds to explain why it seems to him advisable to study the nature of taboo in the primitive conditions of the Australian savages rather than in the higher culture of the Polynesian peoples. [Ibid., 302.] He divides the taboo prohibitions among the Australians into three classes, according as they affect animals, human beings or other objects. The taboos on animals, which consist essentially of prohibitions against killing and eating them, constitute the nucleus of *Totemism*. [Ibid., 303.][1] The second class of taboos, those directed towards human beings, are of an entirely different kind. They are restricted in the first instance to circumstances in which the person on whom the taboo is imposed finds himself in an unusual situation. Thus young men are taboo at their initiation ceremonies, women are taboo during menstruation and immediately after giving birth; so too newborn babies, sick persons and, above all, the dead are taboo. A man's property which is in his constant use is permanently taboo to all other men: his clothing, for instance, his tools and weapons. Included in a man's most personal property, in Australia, is the new name which he received when he was a boy at his initiation. It is taboo and must be kept secret. The third class of taboos, which are imposed on trees, plants, houses and localities, are less stable. They appear to follow a rule that anything that is uncanny or provokes dread for any reason becomes subject to taboo. [Ibid., 304.]

1 Cf. the first and fourth essays in this work.

The modifications shown by taboo in the richer culture of Polynesia and the Malay Archipelago are, as Wundt himself is obliged to admit, not very profound. The more marked social differences among these peoples find expression in the fact that chiefs, kings and priests exercise a specially effective taboo and are themselves subject to a taboo of the [24]
greatest force. [Ibid., 305–6.]

But, adds Wundt, the true sources of taboo lie deeper than in the interests of the privileged classes: 'they have their origin in the source of the most primitive and at the same time most lasting of human drives – in fear of "demonic" powers'. (Ibid., 307.) 'Taboo is originally nothing other than the objectified fear of the "demonic" power which is believed to lie hidden in a tabooed object. The taboo prohibits anything that may provoke that power and commands that, if it has been injured, whether wittingly or unwittingly, the demon's vengeance must be averted.' [Ibid., 308.]

Little by little, we are told, taboo then grows into a force with a basis of its own, independent of the belief in demons. It develops into the rule of custom and tradition and finally of law. 'But the unspoken command underlying all the prohibitions of taboo, with their numberless variations according to the time and place, is originally one and one only: "Beware of the wrath of demons!"' [Loc. cit.]

Wundt informs us, then, that taboo is an expression and derivative of the belief of primitive peoples in 'demonic' power. Later, he tells us, it freed itself from this root and remained a power simply because it *was* a power – from a kind of mental conservatism. And thereafter it itself became the root of our moral precepts and of our laws. Though the first of these assertions may provoke little contradiction, I believe I shall be expressing the thoughts of many readers when I say that Wundt's explanation comes as something of a disappointment. This is surely not tracing back the concept of taboo to its sources or revealing its earliest roots. Neither fear nor demons can be regarded by psychology as 'earliest' things, impervious to any attempt at discovering their antecedents. It would be another matter if demons really existed. But we know that, like gods, they are creations of the human mind [*Seelenkräfte*]: they were made by something and out of something.

Wundt has important views on the double significance of taboo, though these are not very clearly expressed. According to him, the distinction between 'sacred' and 'unclean' did not exist in the primitive beginnings of taboo. For that very reason those concepts were at that [25]
stage without the peculiar significance which they could only acquire

when they became opposed to each other. Animals, human beings or localities on which a taboo was imposed were 'demonic', not 'sacred', nor, therefore, in the sense which was later acquired, 'unclean'. It is precisely this neutral and intermediate meaning – 'demonic' or 'what may not be touched' – that is appropriately expressed by the word 'taboo', since it stresses a characteristic which remains common for all time both to what is sacred and to what is unclean: the dread of contact with it. The persistence, however, of this important common characteristic is at the same time evidence that the ground covered by the two was originally one and that it was only as a result of further influences that it became differentiated and eventually developed into opposites. [Ibid., 309.]

According to Wundt, this original characteristic of taboo – the belief in a 'demonic' power which lies hidden in an object and which, if the object is touched or used unlawfully, takes its vengeance by casting a spell over the wrongdoer – is still wholly and solely 'objectified fear'. That fear has not yet split up into the two forms into which it later develops: *veneration* and *horror*. [Ibid., 310.]

But how did this split take place? Through the transplanting, so Wundt tells us, of the taboo ordinances from the sphere of demons into the sphere of belief in gods. [Ibid., 311.] The contrast between 'sacred' and 'unclean' coincides with a succession of two stages of mythology. The earlier of these stages did not completely disappear when the second one was reached but persisted in what was regarded as an inferior and eventually a contemptible form. [Ibid., 312.] It is, he says, a general law of mythology that a stage which has been passed, for the very reason that it has been overcome and driven under by a superior stage, persists in an inferior form alongside the later one, so that the objects of its veneration turn into objects of horror. (Ibid., 313.)

The remainder of Wundt's discussion deals with the relation of the concept of taboo to purification and sacrifice.

(2)

[26] Anyone approaching the problem of taboo from the angle of psychoanalysis, that is to say, of the investigation of the unconscious portion of the individual mind, will recognize, after a moment's reflection, that these phenomena are far from unfamiliar to him. He has come across people who have created for themselves individual taboo prohibitions of this very kind and who obey them just as strictly as savages obey the

communal taboos of their tribe or society. If he were not already accustomed to describing such people as 'obsessional' patients ['*Zwangskranke*'][T], he would find 'taboo sickness' a most appropriate name for their condition. Having learnt so much, however, about this obsessional sickness from psychoanalytic examination – its clinical aetiology and the essence of its psychical mechanism – he can scarcely refrain from applying the knowledge he has thus acquired to the parallel sociological phenomenon. *Zwang*

A warning must be uttered at this point. The similarity between taboo and obsessional sickness may be no more than a matter of externals; it may apply only to the *forms* in which they are manifested and not extend to their essential character. Nature delights in making use of the same forms in the most various biological connections: as it does, for instance, in the appearance of branch-like structures both in coral and in plants, and indeed in some forms of crystal and in certain chemical precipitates. It would obviously be hasty and unprofitable to infer the existence of any internal relationship from such points of agreement as these, which merely derive from the operation of the same mechanical causes. We shall bear this warning in mind, but we need not be deterred by it from proceeding with our comparison.

The most obvious and striking point of agreement between the obsessional prohibitions of neurotics and taboos is that these prohibitions are equally lacking in motive and equally puzzling in their origin. Having made their appearance at some unspecified moment, they are forcibly maintained by an irresistible fear [*Angst*][T]. No external threat of punishment is required, for there is an internal certainty, a moral conviction, that any violation will lead to intolerable disaster. The most that an [27]
obsessional patient can say on this point is that he has an undefined feeling that some particular person in his environment will be injured as a result of the violation. Nothing is known of the nature of the injury; and indeed even this wretchedly small amount of information is more often obtained in connection with the expiatory and defensive actions which we shall have to discuss later than with the prohibitions themselves.

As in the case of taboo, the principal prohibition, the nucleus of the neurosis, is against touching; and thence it is sometimes known as 'touching phobia' [*Berührungsangst*] or '*délire du toucher*'. The prohibition does not merely apply to immediate physical contact but has an extent as wide as the metaphorical use of the phrase 'to come in contact with'. Anything that directs the patient's thoughts to the

forbidden object, anything that brings him into intellectual contact with it, is just as much prohibited as direct physical contact. This same extension also occurs in the case of taboo.

The purpose of some of the prohibitions is immediately obvious. Others, on the contrary, strike us as incomprehensible, senseless and silly, and prohibitions of this latter sort are described as 'ceremonial'. This distinction, too, is found in the observances of taboo. [See p. 28 f. above.]

Verschiebung

Obsessional prohibitions are extremely liable to displacement [*Verschiebbarkeit*][T]. They extend from one object to another along whatever paths the context may provide, and this new object then becomes, to use the apt expression of one of my women patients, 'impossible' – till at last the whole world lies under an embargo of 'impossibility'. Obsessional patients behave as though the 'impossible' persons and things were carriers of a dangerous infection liable to be spread [*übertragen*] by contact on to everything in their neighbourhood. I have already [p. 28 f.] drawn attention to the same characteristic capacity for contagion and transference [*Übertragbarkeit*] in my description of taboo. We know, too, that anyone who violates a taboo by coming into contact with something that is taboo becomes taboo himself and that then no-one may come into contact with *him*.

I will now put side by side two instances of the transference [*Übertragung*] (or, as it is better to say, the *displacement* [*Verschiebung*]) of a prohibition. One of these is taken from the life of the Maoris and the other from an observation of my own on a female obsessional patient.

[28]

'A Maori chief would not blow a fire with his mouth; for his sacred breath would communicate its sanctity to the fire, which would pass it on to the pot on the fire, which would pass it on to the meat in the pot, which would pass it on to the man who ate the meat, which was in the pot, which stood on the fire, which was breathed on by the chief; so that the eater, infected by the chief's breath conveyed through these intermediaries, would surely die.'[1]

My patient's husband purchased a household article of some kind and brought it home with him. She insisted that it should be removed or it would make the room she lived in 'impossible'. For she had heard that the article had been bought in a shop situated in, let us say, 'Smith' Street.[2] 'Smith', however, was the married name of a woman friend of hers who lived in a distant town and whom she had known in her youth under her maiden name. This friend of hers was at the moment

1 Frazer (1911*b*, 136) [quoting Taylor (1870, 165)].

2 ['*Hirschengasse*' and '*Hirsch*' in the original.]

'impossible' or taboo. Consequently the article that had been purchased here in Vienna was as taboo as the friend herself with whom she must not come into contact.

Obsessional prohibitions involve just as extensive renunciations and restrictions in the lives of those who are subject to them as do taboo prohibitions; but some of them can be lifted if certain actions are performed. Thereafter, these actions *must* be performed: they become compulsive or obsessive acts, and there can be no doubt that they are in the nature of expiation, penance, defensive measures and purification. The commonest of these obsessive acts is washing in water ('washing mania' [*Waschzwang*]). Some taboo prohibitions can be replaced in just the same way; or rather their violation can be made good by a similar 'ceremonial'; and here again lustration with water is the preferred method.

Let us now summarize the points in which agreement between taboo usages and obsessional symptoms is most clearly shown: (1) the fact that the prohibitions lack any assignable motive; (2) the fact that they are maintained by an internal necessity; (3) the fact that they are easily displaceable and that there is a risk of infection from the prohibited object; and (4) the fact that they give rise to injunctions for the performance of ceremonial acts. [29]

Now both the clinical history and the psychical mechanism of obsessional neurosis have become known to us through psychoanalysis. The clinical history of a typical case of 'touching phobia' is as follows. Right at the beginning, in very early childhood, the patient shows a strong *desire* to touch [*Berührungslust*][T], the aim of which is of a far more specialized kind than one would have been inclined to expect. This desire is promptly met with an *external* prohibition against carrying out that particular kind of touching.[1] The prohibition is accepted, since it finds support from powerful *internal* forces,[2] and proves stronger than the drive which is seeking to express itself in the touching. In consequence, however, of the child's primitive psychical constitution, the prohibition does not succeed in *abolishing* the drive. Its only result is to *repress* the drive (the desire to touch) and banish it into the unconscious. Both the prohibition and the drive persist: the drive because it has only been repressed and not abolished, and the prohibition because, if it ceased, the drive would force its way through into consciousness and into actual operation. A situation is created which remains undealt with – a

Lust

1 Both the desire and the prohibition relate to the child's touching his own genitals.

2 That is, from the child's loving relation to the authors of the prohibition.

psychical fixation – and everything else follows from the continuing conflict between the prohibition and the drive.

The principal characteristic of the psychological constellation which becomes fixed in this way is what might be described as the subject's *ambivalent*[1] attitude towards a single object, or rather towards one act in connection with that object. He is constantly wishing to perform this act (the touching), [and looks on it as his supreme enjoyment, but he must not perform it] and detests it as well.[2] The conflict between these two currents cannot be promptly settled because – there is no other way of putting it – they are localized in the subject's mind in such a manner
[30] that they cannot come up against each other. The prohibition is noisily conscious, while the persistent desire to touch is unconscious and the subject knows nothing of it. If it were not for this psychological factor, an ambivalence like this could neither last so long nor lead to such consequences.

In our clinical history of a case we have insisted that the imposition of the prohibition in very early childhood is the determining point; a similar importance attaches in the subsequent developments to the mechanism of repression at the same early age. As a result of the repression which has been enforced and which involves a loss of memory – an amnesia – the motives for the prohibition (which is conscious) remain unknown; and all attempts at disposing of it by intellectual processes must fail, since they cannot find any base of attack. The prohibition owes its strength and its obsessive character precisely to its unconscious opponent, the concealed and undiminished desire – that is to say, to an internal necessity inaccessible to conscious inspection. The ease with which the prohibition can be transferred and extended reflects a process which falls in with the unconscious desire and is greatly facilitated by the psychological conditions that prevail in the unconscious. The desire from the drive [*Trieblust*] is constantly shifting [*verschiebt sich*] in order to escape from the impasse and endeavours to find substitutes – substitute objects and substitute acts – in place of the prohibited ones. In consequence of this, the prohibition itself shifts about as well, and extends to any new aims which the forbidden impulse may adopt. Any fresh advance made by the repressed libido is answered by a fresh sharpening of the prohibition. The mutual inhibition [*Hemmung*][T] of

1 To borrow the apt term coined by Bleuler [1910*b*].

2 [From the second edition (1920) onwards, the words in square brackets were, perhaps accidentally, omitted.]

the two conflicting forces produces a need for discharge [*Abfuhr*], for reducing the prevailing tension; and to this may be attributed the reason for the performance of obsessive acts. In the case of a neurosis these are clearly compromise actions: from one point of view they are evidences of remorse, efforts at expiation, and so on, while on the other hand they are at the same time substitutive acts to compensate the drive for what has been prohibited. It is a law of neurotic illness that these obsessive acts fall more and more under the sway of the drive and approach nearer and nearer to the activity which was originally prohibited.

Let us now make the experiment of treating taboo as though it were [31]
of the same nature as an obsessional prohibition in one of our patients. We must make it clear beforehand, however, that many of the taboo prohibitions that come under our notice are of a secondary, displaced and distorted kind, and that we shall have to be satisfied if we can throw only a little light on the most fundamental and significant taboos. Moreover, the differences between the situation of a savage and of a neurotic are no doubt of sufficient importance to make any exact agreement impossible and to prevent our carrying the comparison to the point of identity in every detail.

In the first place, then, it must be said that there is no sense in asking savages to tell us the real reason [*Motivierung*] for their prohibitions – the origin of taboo. It follows from our postulates that they cannot answer, since their real reason must be 'unconscious'. We can, however, reconstruct the history of taboo as follows on the model of obsessional prohibitions. Taboos, we must suppose, are prohibitions of primaeval antiquity which were at some time externally imposed upon a generation of primitive men; they must, that is to say, no doubt have been impressed on them violently by the previous generation. These prohibitions must have concerned activities towards which there was a strong inclination. They must then have persisted from generation to generation, perhaps merely as a result of tradition transmitted through parental and social authority. Possibly, however, in later generations they may have become 'organized' as an inherited psychical endowment. Who can decide whether such things as 'innate ideas' [*angeborene Ideen*] exist, or whether in the present instance they have operated, either alone or in conjunction with education, to bring about the permanent fixing of taboos? But one thing would certainly follow from the persistence of the taboo, namely that the original desire [*Lust*] to do the prohibited

thing must also still persist among the tribes concerned. They must therefore have an *ambivalent attitude* towards their taboos. In their unconscious there is nothing they would like more than to violate them, but they are afraid to do so; they are afraid precisely because they would like to, and the fear is stronger than the desire. The desire is unconscious, however, in every individual member of the tribe just as it is in neurotics.

[32] The most ancient and important taboo prohibitions are the two basic laws of *totemism*: not to kill the totem animal and to avoid sexual intercourse with members of the totem clan of the opposite sex.

These, then, must be the oldest and most powerful of human desires. We cannot hope to understand this or test our hypothesis on these two examples so long as we are totally ignorant of the meaning and origin of the totemic system. But the wording of these two taboos and the fact of their concurrence will remind anyone acquainted with the findings of psychoanalytic investigations on individuals of something quite definite, which psychoanalysts regard as the centre point of childhood wishes and as the nucleus of neuroses.[1]

The multiplicity of the manifestations of taboo, which have led to the attempts at classification that I have already mentioned, are reduced to a single unity by our thesis: the basis of taboo is a prohibited action, for performing which a strong inclination exists in the unconscious.

We have heard [see p. 27 f. above], though without understanding it, that anyone who does what is forbidden, that is, who violates a taboo, becomes taboo himself. How is this to be brought into line with the fact that taboo attaches not only to a person who has done what is forbidden but also to persons in particular states, to the states themselves, as well as to impersonal objects? What can the dangerous attribute be which remains the same under all these different conditions? There is only one thing it can be: the quality of exciting men's ambivalence and *tempting* them to transgress the prohibition.

Anyone who has violated a taboo becomes taboo himself because he possesses the dangerous quality of tempting others to follow his example: why should *he* be allowed to do what is forbidden to others? Thus he is truly *contagious* in that every example encourages imitation, and for that reason he himself must be shunned.

But a person who has not violated any taboo may yet be permanently or temporarily taboo because he is in a state which possesses the quality

1 Cf. my forthcoming study upon totemism, to which I have referred more than once in these pages (the fourth essay in this work).

of arousing forbidden desires in others and of awakening a conflict of ambivalence in them. The majority of exceptional positions and exceptional states [see p. 29 above] are of this kind and possess this dangerous power. The king or chief arouses envy on account of his privileges: everyone, perhaps, would like to be a king. Dead men, newborn babies and women menstruating or in labour stimulate desires by their special helplessness; a man who has just reached maturity stimulates them by the promise of new enjoyment. For that reason all of these persons and all of these states are taboo, since temptation must be resisted. [33]

Now, too, we can understand why the amounts of *mana* possessed by different persons can be subtracted from one another and can to some extent cancel one another out [see p. 28]. A king's taboo is too strong for one of his subjects because the social difference between them is too great. But a minister may without any harm serve as an intermediary between them. If we translate this from the language of taboo into that of normal psychology, it means something like this. A subject, who dreads the great temptation presented to him by contact with the king, can perhaps tolerate dealings with an official whom he does not need to envy so much and whose position may even seem attainable to him. A minister, again, can mitigate his envy of the king by reflecting on the power which he himself wields. So it comes about that smaller differences between the amounts of the tempting magical force possessed by two people are less to be feared than greater ones.

It is equally clear why it is that the violation of certain taboo prohibitions constitutes a social danger which must be punished or atoned for by *all* the members of the community if they are not all to suffer injury [see p. 27]. If we replace the unconscious desires with conscious impulses we shall see that the danger is a real one. It lies in the risk of imitation, which would quickly lead to the dissolution of the community. If the violation were not avenged by the other members they would become aware that they wanted to act in the same way as the transgressor.

We cannot be surprised at the fact that, in the restrictions of taboo, touching plays a part similar to the one which it plays in 'touching phobias', though the secret meaning of the prohibition cannot be of such a specialized nature in taboo as it is in the neurosis. Touching is the first step towards obtaining any sort of control over, or attempting to make use of, a person or object. [34]

We have translated the contagious power inherent in taboo into the possession of some attribute likely to produce temptation or encourage

imitation. This does not appear to tally with the fact that the contagious character of taboo is shown chiefly by its transmissibility on to material objects, which then themselves become carriers of taboo.

This transmissibility of taboo is a reflection of the tendency, on which we have already remarked, for the unconscious drive in the neurosis to shift constantly along associative paths on to new objects. Our attention is thus directed to the fact that the dangerous magical force of *mana* corresponds to two powers of a more realistic sort: the power of reminding a man of his own prohibited wishes and the apparently more important one of inducing him to transgress the prohibition in obedience to those wishes. These two functions can be reduced to one, however, if we suppose that in a primitive mind the awakening of the memory of a forbidden action is naturally linked with the awakening of an impulse to put that action into effect. Thus recollection and temptation come together again. It must be admitted, too, that, insofar as the example of a man transgressing a prohibition tempts another man to do the same, disobedience to prohibitions spreads like a contagion, in just the same way as a taboo is transferred from a person to a material object and from one material object to another.

If the violation of a taboo can be made good by atonement or expiation, which involve the renunciation of some possession or some freedom, this proves that obedience to the taboo injunction meant in itself the *renunciation* of something desirable. Emancipation from one renunciation is made up for by the imposition of another one elsewhere. This leads us to conclude that atonement is a more fundamental factor than purification in the ceremonials of taboo.

I will now sum up the respects in which light has been thrown on the nature of taboo by comparing it with the obsessional prohibitions of neurotics. Taboo is a primaeval prohibition forcibly imposed (by some
[35] authority) from outside, and directed against the most powerful longings to which human beings are subject. The desire to violate it persists in their unconscious; those who obey the taboo have an ambivalent attitude to what the taboo prohibits. The magical power that is attributed to taboo is based on the capacity for arousing temptation; and it acts like a contagion because examples are contagious and because the prohibited desire in the unconscious shifts from one thing to another. The fact that the violation of a taboo can be atoned for by a renunciation shows that renunciation lies at the basis of obedience to taboo.

(3)

What we now want to discover is how much value is to be attributed to the parallel we have drawn between taboo and obsessional neurosis and to the view of taboo which we have based on that parallel. Their value must clearly depend on whether the view we have put forward has any advantages over others, and whether it gives us a clearer understanding of taboo than we could otherwise reach. We may be inclined to feel that we have given sufficient evidence of the applicability of our view in what has already been said; yet we must attempt to strengthen the evidence by entering into our explanation of taboo prohibitions and usages in greater detail.

There is also another path open to us. We can start an inquiry as to whether some of the hypotheses which we have carried over from neuroses to taboo or some of the results to which that procedure has led us may not be directly verifiable in the phenomena of taboo. But we must decide what we are to look for. Our assertion that taboo originated in a primaeval prohibition imposed at one time or other by some external authority is obviously incapable of demonstration. What we shall rather endeavour to confirm, therefore, are the psychological determinants of taboo, which we have learnt to know from obsessional neurosis. How did we arrive at our knowledge of these psychological factors in the case of the neurosis? Through the analytical study of its symptoms, and particularly of obsessional acts, defensive measures and obsessional commands. We found that they showed every sign of being derived from *ambivalent* impulses, either [36] corresponding simultaneously to *both* a wish and a counterwish or operating predominantly on behalf of *one* of the two opposing trends. If, now, we could succeed in demonstrating that ambivalence, that is, the dominance of opposing trends, is also to be found in the observances of taboo, or if we could point to some of them which, like obsessional acts, give simultaneous expression to both currents, we should have established the psychological agreement between taboo and obsessional neurosis in what is perhaps their most important feature.

The two fundamental prohibitions of taboo are, as I have already remarked, inaccessible to our analysis owing to their connection with totemism; while certain others of its injunctions are of a secondary nature and consequently useless for our purpose. For taboo has become the ordinary method of legislation in the communities affected by it and

it has come to serve social purposes which are certainly more recent than taboo itself: such, for instance, are the taboos imposed by chiefs and priests for the protection of their own property and privileges. There nevertheless remain a large group of observances on which our investigation can be made. From these I shall select the taboos attaching (*a*) to enemies, (*b*) to chiefs and (*c*) to the dead; and I shall take the material for our examination from the excellent collection included by Frazer in *Taboo and the Perils of the Soul* (1911*b*), the second part of his great work *The Golden Bough*.

(*a*) *The Treatment of Enemies*

We may be inclined to suppose that savage and half-savage races are guilty of uninhibited and ruthless cruelty towards their enemies. We shall be greatly interested to learn, then, that even in their case the killing of a man is governed by a number of observances which are included among the usages of taboo. These observances fall easily into four groups. They demand (1) the appeasement of the slain enemy, (2) restrictions upon the slayer, (3) acts of expiation and purification by him and (4) certain ceremonial observances. Our incomplete information on the subject does not enable us to determine with certainty how general or the reverse
[37] these usages may be among the peoples concerned; but for our purposes this is a matter of indifference. It may safely be assumed, in any case, that what we have before us are not isolated peculiarities but widespread usages.

The rites of *appeasement* performed in the island of Timor, when a warlike expedition has returned in triumph bringing the heads of the vanquished foe, are particularly remarkable, since in addition to them the leader of the expedition is submitted to severe restrictions (see below [p. 44 f.]). On the occasion of the expedition's return, sacrifices are offered to appease the souls of the men whose heads have been taken. 'The people think that some misfortune would befall the victor were such offerings omitted. Moreover, a part of the ceremony consists of a dance accompanied by a song, in which the death of the slain man is lamented and his forgiveness is entreated. "Be not angry", they say, "because your head is here with us; had we been less lucky, our heads might now have been exposed in your village. We have offered the sacrifice to appease you. Your spirit may now rest and leave us in peace. Why were you our enemy? Would it not have been better that we should

remain friends? Then your blood would not have been spilt and your head would not have been cut off.'"[1] The same is true of the people of Paloo, in Celebes. So, too, 'the Gallas [of East Africa] returning from war sacrifice to the jinn or guardian spirits of their slain foes before they will re-enter their own houses'.[2]

Other peoples have found a means for changing their former enemies after their death into guardians, friends and benefactors. This method lies in treating their severed heads with affection, as some of the savage races of Borneo boast of doing. When the Sea Dyaks of Sarawak bring home a head from a successful head-hunting expedition, for months after its arrival it is treated with the greatest consideration and addressed with all the names of endearment of which their language is capable. The most dainty morsels of food are thrust into its mouth, delicacies of all kinds and even cigars. The head is repeatedly implored to hate its former friends and to love its new hosts since it has now become one of them. It would be a great mistake to suppose that these observances, which strike [38] us as so horrible, are performed with any intention of ridicule.[3]

In several of the savage tribes of North America observers have been struck by the mourning over enemies who have been killed and scalped. When a Choctaw had killed an enemy, he went into mourning for a month during which he was subjected to severe restrictions; and the Dacotas had similar practices. When the Osages, reports a witness, have mourned over their own dead, 'they will mourn for the foe just as if he was a friend'.[4]

Before considering the remaining classes of taboo usages in connection with enemies, we must deal with an obvious objection. It will be argued against us, with Frazer and others, that the grounds for such rites of appeasement are simple enough and have nothing to do with any such thing as 'ambivalence'. These peoples are dominated by a superstitious fear of the ghosts of the slain – a fear which was not unknown in classical antiquity and which was put upon the stage by the great English dramatist in the hallucinations of Macbeth and Richard III. All the rites of appeasement follow logically from this superstition, as well as the restrictions and acts of expiation which will be discussed presently. This view is also supported by the fourth group of these observances, which

1 Frazer (1911*b*, 166) [quoting Gramberg (1872, 216)].

2 Frazer (loc. cit.), quoting Paulitschke (1893–6, [**2**, 50, 136]).

3 Frazer (1914, **1**, 295), quoting Low (1848, [206]).

4 Frazer (1911*b*, 181), quoting Dorsey (1884, [126]).

can only be explained as attempts at driving away the ghosts of the victims that are pursuing their murderers.[1] In addition to this, the savages openly admit their fear of the ghosts of dead enemies and themselves attribute to it the taboo usages which we are discussing.

This objection is indeed an obvious one, and if it covered the whole ground we could save ourselves the trouble of any further attempt at an explanation. I shall put off dealing with it until later, and for the moment I will merely state the alternative view which is derived from the hypothesis based upon our earlier discussions of taboo. The conclusion that we
[39] must draw from all these observances is that the impulses which they express towards an enemy are not solely hostile ones. They are also manifestations of remorse, of admiration for the enemy, and of a bad conscience for having killed him. It is difficult to resist the notion that, long before a table of laws was handed down by any god, these savages were in possession of a living commandment: 'Thou shalt not kill', a violation of which would not go unpunished.

Let us now return to the other three groups of taboo observances. *Restrictions* placed upon a victorious slayer are unusually frequent and as a rule severe. In Timor (cf. the rites of appeasement described above [on p. 42 f.]) the leader of the expedition is forbidden 'to return at once to his own house. A special hut is prepared for him, in which he has to reside for two months, undergoing bodily and spiritual purification. During this time he may not go to his wife nor feed himself; the food must be put into his mouth by another person.'[2] In some Dyak tribes men returning from a successful expedition are obliged to keep to themselves for several days and abstain from various kinds of food; they may not touch iron nor have any intercourse with women. In Logea, an island in the neighbourhood of New Guinea, 'men who have killed or assisted in killing enemies shut themselves up for about a week in their houses. They must avoid all intercourse with their wives and friends, and they may not touch food with their hands. They may eat vegetable food only, which is brought to them cooked in special pots. The intention of these restrictions is to guard the men against the smell of the blood of the slain; for it is believed that if they smelt the blood they would fall ill and die. In the Toaripi or Motumotu tribe of south-eastern New Guinea a man who

1 Frazer (1911*b*, 169–74). These ceremonies consist of beating on shields, shouting and screaming, making noises with musical instruments, etc.

2 Frazer (1911*b*, 166), quoting Müller (1857, [**2**, 252]).

has killed another may not go near his wife, and may not touch food with his fingers. He is fed by others, and only with certain kinds of food. These observances last till the new moon.' [Frazer, 1911*b*, 167.]

I shall not attempt to give a complete catalogue of the instances quoted by Frazer of restrictions imposed upon victorious manslayers. I will only remark upon a few more such cases in which their taboo character is [40] particularly marked or in which the restrictions are accompanied by expiation, purification and other ceremonials.

'Among the Monumbos of German New Guinea anyone who has slain a foe in war becomes thereby "unclean"' – the same term being applied to women who are menstruating or in child-bed. He 'must remain a long time in the men's club-house, while the villagers gather round him and celebrate his victory with dance and song. He may touch nobody, not even his own wife and children; if he were to touch them it is believed that they would be covered with sores. He becomes clean again by washing and using other modes of purification.' [Ibid., 169.]

'Among the Natchez of North America young braves who had taken their first scalps were obliged to observe certain rules of abstinence for six months. They might not sleep with their wives nor eat flesh; their only food was fish and hasty-pudding. . . . When a Choctaw had killed an enemy and taken his scalp, he went into mourning for a month, during which he might not comb his hair, and if his head itched he might not scratch it except with a little stick which he wore fastened to his wrist for the purpose.' [Ibid., 181.]

'When a Pima Indian had killed an Apache, he had to go through severe ceremonies of purification and atonement. During a sixteen-day fast he might not touch meat nor salt, nor look on a blazing fire, nor speak to a human being. He lived alone in the woods, waited on by an old woman, who brought him his scanty dole of food. He bathed often in the river and (as a sign of mourning) kept his head covered with a plaster of mud. On the seventeenth day there was a public ceremony of solemn purification of the man and his weapons. Since the Pima Indians took the taboo on killing much more seriously than their enemies and did not, like them, postpone the expiation and purification till the end of the expedition, their warlike efficiency suffered greatly from their moral strictness, or piety, if that term is preferred. Despite their extreme courage, the Americans found them unsatisfactory allies in their operations against the Apaches.' [Ibid., 182–4.]

However much the details and variations of the ceremonies of
[41] expiation and purification after the slaying of enemies might be of interest for deeper research into the subject, I shall break off at this point, since for our present purpose they have nothing more to tell us. I may perhaps suggest that the temporary or permanent isolation of professional executioners, which has persisted to the present day, may belong in this connection. The position of the public hangman in mediaeval society offers a good picture of the workings of 'taboo' among savages.[1]

In the accepted explanation of all these observances of appeasement, restriction, expiation and purification, two principles are combined: the extension of the taboo from the slain man on to everything that has come in contact with him, and the fear of the slain man's ghost. How these two factors are to be combined with each other to explain the ceremonials, whether they are to be regarded as of equal weight, whether one is primary and the other secondary, and if so which – none of these questions receives an answer, and indeed it would be hard to find one. We, on the other hand, can lay stress on the *unity* of our view, which derives all of these observances from emotional ambivalence towards the enemy.

(*b*) *The Taboo upon Rulers*

The attitude of primitive peoples to their chiefs, kings and priests is governed by two basic principles which seem to be complementary rather than contradictory. A ruler 'must not only be guarded, he must also be guarded against'. (Frazer, 1911*b*, 132.) Both of these ends are secured by innumerable taboo observances. We know already why it is that rulers must be guarded against. It is because they are vehicles of the mysterious and dangerous magical power which is transmitted by contact like an electric charge and which brings death and ruin to anyone who is not protected by a similar charge. Any immediate or indirect contact with this dangerous sacred entity is therefore avoided; and, if it cannot be avoided, some ceremonial is devised to avert the dreaded consequences. The Nubas of East Africa, for
[42] instance, 'believe that they would die if they entered the house of their priestly king; however they can evade the penalty of their intrusion by baring the left shoulder and getting the king to lay his hand on it'. [Loc. cit.] Here we are met with the remarkable fact that contact

1 Further examples of these practices can be found in Frazer (1911*b*, 165–90) in the section upon 'Manslayers tabooed'.

with the king is a remedy and protection against the dangers provoked by contact with the king. No doubt, however, there is a contrast to be drawn between the remedial power of a touch made deliberately by the king and the danger which arises if he is touched – a contrast between a passive and an active relation to the king.

For examples of the healing power of the royal touch there is no need to resort to savages. The kings of England, in times that are not yet remote, enjoyed the power of curing scrofula, which was known accordingly as 'the King's Evil'. Queen Elizabeth I exercised this royal prerogative no less than her successors. Charles I is said to have cured a hundred patients at a stroke in 1633. But it was after the Restoration of the monarchy under his dissolute son, Charles II, that the royal cures of scrofula reached their climax. In the course of his reign he is reputed to have touched close upon a hundred thousand persons. The crowd of those in search of cure used to be so great that on one occasion six or seven of those who came to be healed were trampled to death. The sceptical William of Orange, who became King of England after the dismissal of the Stuarts, refused to lend himself to these magical practices. On the only occasion on which he was persuaded into laying his hands on a patient, he said to him: 'God give you better health and more sense.' (Frazer, 1911*a*, **1**, 368–70.)

The stories which follow are evidence of the fearful effects of active contact made, even unintentionally, with a king or anything belonging to him. 'It once happened that a New Zealand chief of high rank and great sanctity had left the remains of his dinner by the wayside. A slave, a stout, hungry fellow, coming up after the chief had gone, saw the unfinished dinner, and ate it up without asking questions. Hardly had he finished when he was informed by a horror-stricken spectator that the food of which he had eaten was the chief's.' He was a strong, courageous man, but 'no sooner did he hear the fatal news than he was seized with the most extraordinary convulsions and cramp in the stomach, which never ceased till he died, about sundown the same day'.[1] 'A Maori [43]
woman having eaten of some fruit, and being afterwards told that the fruit had been taken from a tabooed place, exclaimed that the spirit of the chief, whose sanctity had been thus profaned, would kill her. This was in the afternoon, and next day by twelve o'clock she was dead.'[2] 'A Maori chief's tinder-box was once the means of killing several persons; for, having been lost by him, and found by some men who used it to

1 Frazer (1911*b*, 134–5), quoting a Pakeha Maori (1884, [96 f.]).

2 Frazer (loc. cit.), quoting Brown (1845, [76]).

light their pipes, they died of fright on learning to whom it had belonged.'[1]

It is not to be wondered at that a need was felt for isolating such dangerous persons as chiefs and priests from the rest of the community – to build a barrier round them which would make them inaccessible. It may begin to dawn on us that this barrier, originally erected for the observance of taboo, exists to this day in the form of court ceremonial.

But perhaps the major part of this taboo upon rulers is not derived from the need for protection *against* them. The second reason for the special treatment of privileged persons – the need to provide protection *for* them against the threat of danger – has had an obvious part in creating taboos and so of giving rise to court etiquette.

The need to protect the king from every possible form of danger follows from his immense importance to his subjects, whether for weal or woe. It is his person which, strictly speaking, regulates the whole course of existence. 'The people have to thank him for the rain and sunshine which foster the fruits of the earth, for the wind which brings ships to their coasts, and even for the solid ground beneath their feet.' (Frazer, 1911*b*, 7.)

These rulers among savage peoples possess a degree of power and a capacity to confer benefits which are an attribute only of gods, and with which at later stages of civilization only the most servile of courtiers would pretend to credit them.

It must strike us as self-contradictory that persons of such unlimited power should need to be protected so carefully from the threat of
[44] danger; but that is not the only contradiction shown in the treatment of royal personages among savage peoples. For these peoples also think it necessary to keep a watch on their king to see that he makes a proper use of his powers; they feel by no means convinced of his good intentions or conscientiousness. Thus an element of distrust may be traced among the reasons for the taboo observances that surround the king. 'The idea', writes Frazer (1911*b*, 7 f.), 'that early kingdoms are despotisms in which the people exist only for the sovereign, is wholly inapplicable to the monarchies we are considering. On the contrary, the sovereign in them exists only for his subjects; his life is only valuable so long as he discharges the duties of his position by ordering the course of nature for his people's benefit. So soon as he fails to do so, the care, the devotion, the religious homage which they had hitherto lavished on

1 Frazer (loc. cit.) [quoting Taylor (1870, 164)].

him cease and are changed into hatred and contempt; he is dismissed ignominiously, and may be thankful if he escapes with his life. Worshipped as a god one day, he is killed as a criminal the next. But in this changed behaviour of the people there is nothing capricious or inconstant. On the contrary, their conduct is entirely of a piece. If their king is their god, he is or should be also their preserver; and if he will not preserve them, he must make room for another who will. So long, however, as he answers their expectations, there is no limit to the care which they take of him, and which they compel him to take of himself. A king of this sort lives hedged in by a ceremonious etiquette, a network of prohibitions and observances, of which the intention is not to contribute to his dignity, much less to his comfort, but to restrain him from conduct which, by disturbing the harmony of nature, might involve himself, his people, and the universe in one common catastrophe. Far from adding to his comfort, these observances, by trammelling his every act, annihilate his freedom and often render the very life, which it is their object to preserve, a burden and sorrow to him.'

One of the most glaring instances of a sacred ruler being fettered and paralysed in this way by taboo ceremonials is to be found in the mode of life of the Mikado of Japan in earlier centuries. An account written more than two hundred years ago reports that the Mikado 'thinks it would be very prejudicial to his dignity and holiness to touch the ground with his feet; for this reason, when he intends to go [45]
anywhere, he must be carried thither on men's shoulders. Much less will they suffer that he should expose his sacred person to the open air, and the sun is not thought worthy to shine on his head. There is such a holiness ascribed to all parts of his body that he dares to cut off neither his hair, nor his beard, nor his nails. However, lest he should grow too dirty, they may clean him in the night when he is asleep; because, they say, that which is taken from his body at that time hath been stolen from him and that such a theft doth not prejudice his holiness or dignity. In ancient times he was obliged to sit on the throne for some hours every morning, with the imperial crown on his head, but to sit altogether like a statue, without stirring either hands or feet, head or eyes, nor indeed any part of his body, because, by this means, it was thought that he could preserve peace and tranquillity in his empire; for if, unfortunately, he turned himself on one side or the other, or if he looked a good while towards any part of his dominions, it was apprehended that war, famine, fire, or some other great misfortune was near at hand to desolate the country.'[1]

1 Kaempfer (1727, [**1**, 150]), quoted by Frazer (1911*b*, 3 f.).

Some of the taboos laid upon barbarian kings remind one vividly of the restrictions imposed upon murderers. Thus in West Africa, 'at Shark Point near Cape Padron, in Lower Guinea, lives the priestly king Kukulu, alone in a wood. He may not touch a woman nor leave his house; indeed he may not even quit his chair, in which he is obliged to sleep sitting, for if he lay down no wind would arise and navigation would be stopped. He regulates storms, and in general maintains a wholesome and equable state of the atmosphere.' The same writer says of Loango (in the same part of the world) that the more powerful a king is, the more taboos he is bound to observe.[1] The heir to the throne is also subject to them from infancy; their number increases as he advances in life, till at the moment that he ascends the throne he is positively suffocated by them.

Our space will not allow nor does our interest require us to enter further into a description of the taboos associated with the dignity of kings
[46] and priests. I will add only that the principal part is played in them by restrictions upon freedom of movement and upon diet. Two examples of taboo ceremonials occurring in civilized communities of a far higher level of culture will serve to show, however, what a conservative effect upon ancient usages is exercised by contact with these privileged personages.

The Flamen Dialis, the high priest of Jupiter in ancient Rome, was obliged to observe an extraordinary number of taboos. He 'might not ride or even touch a horse, nor see an army under arms, nor wear a ring which was not broken, nor have a knot on any part of his garments; . . . he might not touch wheaten flour or leavened bread; he might not touch or even name a goat, a dog, raw meat, beans, and ivy; . . . his hair could be cut only by a free man and with a bronze knife, and his hair and nails when cut had to be buried under a lucky tree; . . . he might not touch a dead body; . . . he might not be uncovered in the open air', and so on. 'His wife, the Flaminica, had to observe nearly the same rules, and others of her own besides. She might not ascend more than three steps of the kind of staircase called Greek; at a certain festival she might not comb her hair; the leather of her shoes might not be made from a beast that had died a natural death, but only from one that had been slain or sacrificed; if she heard thunder she was tabooed till she had offered an expiatory sacrifice.' (Frazer, 1911*b*, 13 f.)

The ancient kings of Ireland were subject to a number of exceedingly strange restrictions. If these were obeyed, every kind of blessing would descend upon the country, but if they were violated, disasters of every kind would visit it. A complete list of these taboos is contained in the

1 Frazer (1911*b*, 5 and 8), quoting Bastian (1874–5, [**1**, 287 and 355]).

Book of Rights, the two oldest manuscript copies of which date from 1390 and 1418. The prohibitions are of the most detailed character, and refer to specific actions at specific places at specific times: the king, for instance, may not stay in a certain town on a particular day of the week; he may not cross a certain river at a particular hour of the day; he may not encamp for nine days on a certain plain, and so on. (Frazer, 1911*b*, 11 f.)

Among many savage peoples the severity of these taboo restrictions upon priestly kings has led to consequences which have been important historically and are of particular interest from our point of view. The dignity of their position ceased to be an enviable thing, and those who [47]
were offered it often took every possible means of escaping it. Thus in Cambodia, where there are kingships of Fire and Water, it is often necessary to force successors into accepting these distinctions. On Niuē or Savage Island, a coral island in the South Pacific, the monarchy actually came to an end because no-one could be induced to take over the responsible and dangerous office. 'In some parts of West Africa, when the king dies, a family council is secretly held to determine his successor. He on whom the choice falls is suddenly seized, bound, and thrown into the fetish-house, where he is kept in durance till he consents to accept the crown. Sometimes the heir finds means of evading the honour which it is thought to thrust upon him; a ferocious chief has been known to go about constantly armed, resolute to resist by force any attempt to set him on the throne.'[1] Among the natives of Sierra Leone the objection to accepting the honour of kingship became so great that most tribes were obliged to choose foreigners as their kings.

Frazer [1911*b*, 17–25] attributes to these circumstances the fact that in the course of history there eventually came about a division of the original priestly kingship into a spiritual and a temporal power. Weighed down by the burden of their sacred office, kings became unable to exert their dominance in real affairs and these were left in the hands of inferior but practical persons, who were ready to renounce the honours of kingship. These, then, became the temporal rulers, while spiritual supremacy, deprived of any practical significance, was left to the former taboo kings. It is familiar knowledge how far this hypothesis finds confirmation in the history of old Japan.

If we take a general survey of the relations of primitive men to their rulers, we are left with an expectation that we shall have no great difficulty in advancing from a description of them to a psychoanalytic

1 Frazer (1911*b*, 17 f.), quoting Bastian (1874–5, [**1**, 354, and **2**, 9]).

understanding of them. Those relations are of a complex kind and not free from contradictions. Rulers are allowed great privileges, which coincide exactly with the taboo prohibitions imposed on other people. They are privileged persons: they may do or enjoy precisely what other
[48] people are forbidden by taboo. As against this freedom, however, we find that they are restricted by other taboos from which common people are exempt. Here we have a first contrast – a contradiction, almost – the fact, that is, of the same individual being both more free and more restricted. Again, they are regarded as possessing extraordinary powers of magic, so that people are afraid of coming into contact with their persons or their property, while on the other hand the most beneficial consequences are expected from that same contact. Here there seems to be another, particularly glaring, contradiction; but, as we have already seen, it is only an apparent one. Contacts originating from the king himself are healing and protective; the dangerous contacts are those effected by common men upon the king or his belongings – probably because they may hint at aggressive impulses. Yet another contradiction, and one not so easily resolved, is to be found in the fact that the ruler is believed to exercise great authority over the forces of Nature, but that he has to be most carefully protected against the threat of danger – as though his own power, which can do so much, cannot do this. The situation is made still more difficult by the fact that the ruler cannot be trusted to make use of his immense powers in the right way, that is, for the benefit of his subjects and for his own protection. Thus people distrust him and feel justified in keeping a watch on him. The etiquette of taboos to which the king's whole life is subjected serves all these protective purposes at once: his own protection from dangers and the protection of his subjects from the dangers with which he threatens them.

It seems plausible to explain the complicated and contradictory attitude of primitive peoples to their rulers in some such way as the following. For superstitious and other reasons, a variety of different impulses find expression in relation to kings; and each of these impulses is developed to an extreme point without regard to the others. This gives rise to contradictions – by which, incidentally, a savage intellect is as little disturbed as is a highly civilized one when it comes to such matters as religion or 'loyalty'.

So far so good; but the technique of psychoanalysis allows us to go into the question further and to enter more into the details of these various impulses. If we submit the recorded facts to analysis, as though they

formed part of the symptoms presented by a neurosis, our starting point [49]
must be the excessive apprehensiveness and solicitude which is put forward as the reason for the taboo ceremonials. The occurrence of excessive solicitude of this kind is very common in neuroses, and especially in obsessional neuroses, with which our comparison is chiefly drawn. We have come to understand its origin quite clearly. It appears wherever, in addition to a predominant feeling of affection, there is also a contrary, but unconscious, current of hostility – a state of affairs which represents a typical instance of an ambivalent emotional attitude. The hostility is then shouted down, as it were, by an excessive intensification of the affection, which is expressed as solicitude and becomes compulsive, because it might otherwise be inadequate to perform its task of keeping the unconscious contrary current of feeling under repression. Every psychoanalyst knows from experience with what certainty this explanation of solicitous over-affection is found to apply even in the most unlikely circumstances – in cases, for instance, of attachments between a mother and child or between a devoted married couple. If we now apply this to the case of privileged persons, we shall realize that, alongside the veneration, and indeed idolization, felt towards them, there is in the unconscious an opposing current of intense hostility; that, in fact, as we expected, we are faced with a situation of emotional ambivalence. The distrust which provides one of the unmistakable elements in kingly taboos would thus be another, more direct, expression of the same unconscious hostility. Indeed, owing to the variety of outcomes of a conflict of this kind which are reached among different peoples, we are not at a loss for examples in which the existence of this hostility is still more obviously shown. 'The savage Timmes of Sierra Leone', we learn from Frazer,[1] 'who elect their king, reserve to themselves the right of beating him on the eve of his coronation; and they avail themselves of this constitutional privilege with such hearty goodwill that sometimes the unhappy monarch does not long survive his elevation to the throne. Hence when the leading chiefs have a spite at a man and wish to rid themselves of him, they elect him king.' Even in glaring instances like this, however, the hostility is not admitted as such, but masquerades as a ceremonial.

Another side of the attitude of primitive peoples towards their rulers [50]
recalls a procedure which is common in neuroses generally but comes into the open in what are known as delusions of persecution. The importance of one particular person is immensely exaggerated and his absolute

1 Frazer (1911*b*, 18), quoting Zweifel & Moustier (1880, [28]).

power is magnified to the most improbable degree, in order that it may be easier to make him responsible for everything disagreeable that the patient may experience. Savages are really behaving in just the same way with their kings when they ascribe to them power over rain and sunshine, wind and weather, and then depose them or kill them because Nature disappoints their hopes of a successful hunt or a rich harvest. The model upon which paranoics base their delusions of persecution is the relation of a child to his father. A son's picture of his father is habitually clothed with excessive powers of this kind, and it is found that distrust of the father is intimately linked with admiration for him. When a paranoic turns the figure of one of his associates into a 'persecutor', he is raising him to the rank of a father: he is putting him into a position in which he can blame him for all his misfortunes. Thus this second analogy between savages and neurotics gives us a glimpse of the truth that much of a savage's attitude to his ruler is derived from a child's infantile attitude to his father.

But the strongest support for our effort to equate taboo prohibitions with neurotic symptoms is to be found in the taboo ceremonials themselves, the effect of which upon the position of royalty has already been discussed. These ceremonials unmistakably reveal their double meaning and their derivation from ambivalent impulses, as soon as we are ready to allow that the results which they bring about were intended from the first. The taboo does not only pick out the king and exalt him above all common mortals, it also makes his existence a torment and an intolerable burden and reduces him to a bondage far worse than that of his subjects. Here, then, we have an exact counterpart of the obsessional act in the neurosis, in which the suppressed impulse and the impulse that suppresses it find simultaneous and common satisfaction. The obsessional act is *ostensibly* a protection against the prohibited act; but *actually*, in our view, it is a repetition of it. The 'ostensibly' applies to the *conscious* [51] part of the mind, and the 'actually' to the *unconscious* part. In exactly the same way, the ceremonial taboo of kings is *ostensibly* the highest honour and protection for them, while *actually* it is a punishment for their exaltation, a revenge taken on them by their subjects. The experiences of Sancho Panza (as described by Cervantes) when he was governor of his island convinced him that this view of court ceremonial was the only one that met the case. If we could hear the views of modern kings and rulers on the subject, we might find that there were many others who agreed with him.

The question of why the emotional attitude towards rulers includes

such a powerful unconscious element of hostility raises a very interesting problem, but one that lies outside the limits of the present study. I have already hinted at the fact that the child's complex of emotions towards his father – the father complex – has a bearing on the subject, and I may add that more information on the early history of the kingship would throw a decisive light on it. Frazer (1911*a*) has put forward impressive reasons, though, as he himself admits, not wholly conclusive ones, for supposing that the earliest kings were foreigners who, after a brief reign, were sacrificed with solemn festivities as representatives of the deity. It is possible that the course taken by the evolution of kings may also have had an influence upon the myths of Christendom.

(*c*) *The Taboo upon the Dead*

We know that the dead are powerful rulers; but we may perhaps be surprised when we learn that they are treated as enemies.

The taboo upon the dead is – if I may revert to the simile of infection – especially virulent among most primitive peoples. It is manifested, in the first instance, in the consequences that follow contact with the dead and in the treatment of mourners.

Among the Maoris anyone who had handled a corpse or taken any part in its burial was in the highest degree unclean and was almost cut off from intercourse with his fellow men, or, as we might put it, was boycotted. He could not enter any house, or come into contact with any person or thing without infecting them. He might not even touch food with his hands, which, owing to their uncleanness, had become quite [52] useless. 'Food would be set for him on the ground, and he would then sit or kneel down, and, with his hands carefully held behind his back, would gnaw at it as best he could. In some cases he would be fed by another person, who with outstretched arm contrived to do it without touching the tabooed man; but the feeder was himself subjected to many severe restrictions, little less onerous than those which were imposed upon the other. In almost every populous village there lived a degraded wretch, the lowest of the low, who earned a sorry pittance by thus waiting upon the defiled.' He alone was allowed 'to associate at arm's length with one who had paid the last offices . . . to the dead. And when, the dismal term of his seclusion being over, the mourner was about to mix with his fellows once more, all the dishes he had used in his seclusion were diligently smashed, and all the garments he had worn were carefully thrown away.' [Frazer, 1911*b*, 138 f.]

The taboo observances after bodily contact with the dead are the same over the whole of Polynesia, Melanesia and a part of Africa. Their most regular feature is the prohibition against those who have had such contact touching food themselves, and the consequent necessity for their being fed by other people. It is a remarkable fact that in Polynesia (though the report may perhaps refer only to Hawaii) priestly kings were subject to the same restriction while performing their sacred functions.[1] The case of the taboo upon the dead in Tonga offers a specially clear instance of the way in which the degree of prohibition varies according to the taboo power of the person upon whom the taboo is imposed. Thus anyone who touches a dead chief is unclean for ten months; but if he himself is a chief he is tabooed for only three, four or five months according to the rank of the dead man; but if the dead man were the 'great divine chief', even the greatest chief would be tabooed for ten months. These savages believe firmly that anyone who violates the taboo ordinances is bound to fall ill and die; indeed they believe it so firmly that, in the opinion of an observer, 'no native ever made an experiment to prove the contrary'.[2]

[53] Essentially the same prohibitions (though from our point of view they are more interesting) apply to those who have been in contact with the dead only in a metaphorical sense: the dead person's mourning relations, widowers and widows. The observances that we have so far mentioned may seem merely to give characteristic expression to the virulence of the taboo and its contagious power. But those which now follow give us a hint at the *reasons* for the taboo – both the ostensible ones and what we must regard as the deep-lying real ones.

'Among the Shuswap of British Columbia widows and widowers in mourning are secluded and forbidden to touch their own head or body; the cups and cooking vessels which they use may be used by no one else. . . . No hunter would come near such mourners, for their presence is unlucky. If their shadow were to fall on anyone, he would be taken ill at once. They employ thorn-bushes for bed and pillow . . . and thorn-bushes are also laid all around their beds.'[3] This last measure is designed to keep the dead person's ghost at a distance. The same purpose is shown still more clearly in the usage reported from another North American tribe which provides that, after her husband's death, 'a widow would wear a breech-cloth made of dry bunch-grass for several days to prevent

1 Frazer (loc. cit.) [quoting Ellis (1832–6, **4**, 388)].

2 Frazer (1911*b*, 140), quoting Mariner (1818, [**1**, 141]).

3 [Frazer (1911*b*, 142), quoting Boas (1890, 643 f.).]

her husband's ghost having intercourse with her.'[1] This suggests that contact 'in a metaphorical sense' is after all understood as being bodily contact, for the dead man's ghost does not leave his relations and does not cease to 'hover' round them during the time of mourning.

'Among the Agutainos, who inhabit Palawan, one of the Philippine Islands, a widow may not leave her hut for seven or eight days after the death; and even then she may only go out at an hour when she is not likely to meet anybody, for whoever looks upon her dies a sudden death. To prevent this fatal catastrophe, the widow knocks with a wooden peg on the trees as she goes along, thus warning people of her dangerous proximity; and the very trees on which she knocks soon die.'[2] The nature of the danger feared from a widow such as this is made plain by another example. 'In the Mekeo district of British New Guinea a widower loses [54]
all his civil rights and becomes a social outcast, an object of fear and horror, shunned by all. He may not cultivate a garden, nor show himself in public, nor walk on the roads and paths. Like a wild beast he must skulk in the long grass and the bushes; and if he sees or hears anyone coming, especially a woman, he must hide behind a tree or a thicket.'[3] This last hint makes it easy to trace the origin of the dangerous character of widowers or widows to the danger of *temptation*. A man who has lost his wife must resist a desire to find a substitute for her; a widow must fight against the same wish and is moreover liable, being without a lord and master, to arouse the desires of other men. Substitutive satisfactions of such a kind run counter to the sense of mourning and they would inevitably kindle the ghost's wrath.[4]

One of the most puzzling, but at the same time instructive, usages in connection with mourning is the prohibition against uttering the name of the dead person. This custom is extremely widespread, it is expressed in a variety of ways and has had important consequences. It is found not only among the Australians and Polynesians (who usually show us taboo observances in the best state of preservation), but also among 'peoples so widely separated from each other as the Samoyeds of Siberia and the Todas of southern India; the Mongols of Tartary and the Tuaregs of the Sahara; the Ainos of Japan and the Akamba and Nandi of central Africa;

1 [Frazer (1911*b*, 143), quoting Teit (1900, 332 f.).]

2 [Frazer (1911*b*, 144), quoting Blumentritt (1891, 182).]

3 [Frazer (1911*b*, 144), quoting Guis (1902, 208 f.).]

4 The patient whose 'impossibilities' I compared with taboos earlier in this paper (see page 34 f.) told me that whenever she met anyone dressed in mourning in the street she was filled with indignation: such people, she thought, should be forbidden to go out.

the Tinguianes of the Philippines and the inhabitants of the Nicobar Islands, of Borneo, of Madagascar, and of Tasmania.' (Frazer, 1911*b*, 353.) In some of these cases the prohibition and its consequences last only during the period of mourning, in others they are permanent; but it seems invariably to diminish in strictness with the passage of time.

The avoidance of the name of a dead person is as a rule enforced with extreme severity. Thus in some South American tribes it is regarded as a
[55] deadly insult to the survivors to mention the name of a dead relative in their presence, and the punishment for it is not less than that laid down for murder. (Ibid., 352.) It is not easy at first to see why the mention of the name should be regarded with such horror; but the dangers involved have given rise to a whole number of methods of evasion which are interesting and important in various ways. Thus the Masai in East Africa resort to the device of changing the dead man's name immediately after his death; he may then be mentioned freely under his new name while all the restrictions remain attached to the old one. This seems to presuppose that the dead man's ghost does not know and will not get to know his new name. [Ibid., 354.] The Adelaide and Encounter Bay tribes of South Australia are so consistently careful that after a death everyone bearing the same name as the dead man's, or a very similar one, changes it for another. [Ibid., 355.] In some instances, as for instance among certain tribes in Victoria and in North-West America, this is carried a step further, and after a death all the dead person's relations change their names, irrespective of any similarity in their sound. [Ibid., 357.] Indeed, among the Guaycurus in Paraguay, when a death had taken place, the chief used to change the name of every member of the tribe; and 'from that moment everybody remembered his new name just as if he had borne it all his life'.[1]

Moreover, if the name of the dead man happens to be the same as that of an animal or common object, some tribes think it necessary to give these animals or objects new names, so that the use of the former names shall not recall the dead man to memory. This usage leads to a perpetual change of vocabulary, which causes much difficulty to the missionaries, especially when such changes are permanent. In the seven years which the missionary Dobrizhoffer spent among the Abipones of Paraguay, 'the native word for jaguar was changed thrice, and the words for crocodile, thorn, and the slaughter of cattle underwent similar though less varied vicissitudes'.[2] The dread of uttering a dead person's name extends, indeed, to an avoidance of the mention of anything in which the dead

1 Frazer (1911*b*, 357), quoting an old Spanish observer [Lozano (1733, 70)].

2 Frazer (1911*b*, 360), quoting Dobrizhoffer [1784, **2**, 301].

man played a part; and an important consequence of this process of suppression is that these peoples possess no tradition and no historical memory, so that any research into their early history is faced with the greatest difficulties. [Ibid., 362 f.] A number of these primitive races have, however, adopted compensatory usages which revive the names of dead persons after a long period of mourning by giving them to children, who are thus regarded as reincarnations of the dead. [Ibid., 364 f.] [56]

This taboo upon names will seem less puzzling if we bear in mind the fact that savages regard a name as an essential part of a man's personality and as an important possession: they treat words in every sense as things. As I have pointed out elsewhere [Freud, 1905*c*, Chapter IV; *RSE*, **8**], our own children do the same. They are never ready to accept a similarity between two words as having no meaning; they consistently assume that if two things are called by similar-sounding names this must imply the existence of some deep-lying point of agreement between them. Even a civilized adult may be able to infer from certain peculiarities in his own behaviour that he is not so far removed as he may have thought from attributing importance to proper names, and that his own name has become to a very remarkable extent bound up with his personality. So, too, psychoanalytic practice comes upon frequent confirmations of this in the evidence it finds of the importance of names in unconscious mental activities.[1]

As was only to be expected, obsessional neurotics behave exactly like savages in relation to names. Like other neurotics, they show a high degree of 'complexive sensitiveness'[2] in regard to uttering or hearing particular words and names; and their attitude towards their own names imposes numerous, and often serious, inhibitions upon them. One of these taboo patients of my acquaintance had adopted a rule against writing her own name, for fear that it might fall into the hands of someone who would then be in possession of a portion of her personality. She was obliged to fight with convulsive loyalty against the temptations to which her imagination subjected her, and so forbade herself 'to surrender any part of her person'. This included in the first place her name, and later extended to her handwriting, till finally she gave up writing altogether. [57]

We shall no longer feel surprised, therefore, at savages regarding the name of a dead person as a portion of his personality and making it subject to the relevant taboo. So, too, uttering the name of a dead person is

1 Cf. Stekel [1911*c*] and Abraham [1911*a*].

2 ['*Komplexempfindlichkeit*' – a term used by Jung in connection with his word-association experiments.]

clearly a derivative of having contact with him. We may therefore turn to the wider problem of why such contact is submitted to so strict a taboo.

The most obvious explanation would point to horror roused by dead bodies and by the changes which quickly become visible in them. Some part must also be played in the matter by mourning for the dead person, since it must be a motive force [*Motiv*] in everything relating to him. But horror at the corpse clearly does not account for all the details of the taboo observances, and mourning cannot explain why the uttering of the dead man's name is an insult to his survivors. Mourning, on the contrary, tends to be preoccupied with the dead man, to dwell upon his memory and to preserve it as long as possible. Something other than mourning must be held responsible for the peculiarities of the taboo usages, something which has very different purposes in view. It is precisely the taboo upon names that gives us the clue to this unknown motive; and if the usages alone did not tell us, we should learn it from what the mourning savages say to us themselves.

For they make no disguise of the fact that they are *afraid* of the presence or of the return of the dead person's ghost; and they perform a great number of ceremonies to keep him at a distance or drive him off.[1] They feel that to utter his name is equivalent to invoking him and will quickly be followed by his presence.[2] And accordingly they do everything they can to avoid any such evocation. They disguise themselves so that the ghost shall not recognize them,[3] or they change his name or
[58] their own; they are furious with reckless strangers who by uttering the ghost's name incite him against the survivors. It is impossible to escape the conclusion that, in the words of Wundt (1906, 49), they are victims to a fear of 'the dead man's soul which has become a demon'. Here, then, we seem to have found a confirmation of Wundt's view, which, as we have already seen [p. 31 above], considers that the essence of taboo is a fear of demons.

This theory is based on a supposition so extraordinary that it seems at first sight incredible: the supposition, namely, that a dearly loved relative at the moment of his death changes into a demon, from whom his survivors can expect nothing but hostility and against whose evil desires they must protect themselves by every possible means. Nevertheless, almost

1 Frazer (1911*b*, 353) mentions the Tuaregs of the Sahara as an example of this explanation being given by the savages themselves.

2 Subject, perhaps, to the condition that some of his bodily remains are still in existence. (Ibid., 372.)

3 In the Nicobar Islands. (Ibid., 358.)

all the authorities are at one in attributing these views to primitive peoples. Westermarck, who, in my opinion, takes far too little notice of taboo in his book on *The Origin and Development of the Moral Ideas*, actually writes in his chapter on 'Regard for the Dead': 'Generally speaking, my collection of facts has led me to the conclusion that the dead are more commonly regarded as enemies than friends,[1] and that Professor Jevons and Mr. Grant Allen are mistaken in their assertion that, according to early beliefs, the malevolence of the dead is for the most part directed against strangers only, whereas they exercise a fatherly care over the lives and fortunes of their descendants and fellow clansmen.'

In an interesting volume, Rudolf Kleinpaul (1898) has used the remnants among civilized races of the ancient belief in spirits to throw [59] light on the relation between the living and the dead. He, too, reaches the final conclusion that the dead, filled with a lust for murder, sought to drag the living in their train. The dead slew; and the skeleton which we use today to picture the dead stands for the fact that they themselves were slayers. The living did not feel safe from the attacks of the dead till there was a sheet of water between them. That is why men liked to bury the dead on islands or on the farther side of rivers; and that, in turn, is the origin of such phrases as 'Here and in the Beyond'. Later, the malignity of the dead diminished and was restricted to special categories which had a particular right to feel resentment – such as murdered men, for instance, who in the form of evil spirits went in pursuit of their murderers, or brides who had died with their desires unsatisfied. But originally, says Kleinpaul, *all* of the dead were vampires, all of them had a grudge against the living and sought to injure them and rob them of their lives. It was from corpses that the concept of evil spirits first arose.

The hypothesis that after their death those most beloved were transformed into demons clearly raises further questions. What was it that induced primitive men to attribute such a change of feeling to those who had been dear to them? Why did they make them into demons? Westermarck (1906–8, **2**, 534 f.) is of the opinion that these questions can

1 Westermarck (1906–8, **2**, 532 ff.). In his footnotes and in the section of the text which follows, the author gives copious confirmatory evidence, often of an extremely pertinent sort. For instance: 'Among the Maoris the nearest and most beloved relatives were supposed to have their natures changed by death, and to become malignant, even towards those they formerly loved. [Quoting Taylor (1870, 18).] . . . Australian natives believed that a deceased person is malevolent for a long time after death, and the more nearly related the more he is feared. [Quoting Fraser (1892, 80).] . . . According to ideas prevalent among the Central Eskimo, the dead are at first malevolent spirits who frequently roam around the villages, causing sickness and mischief and killing men by their touch; but subsequently they are supposed to attain rest and are no longer feared. (Quoting Boas [1889, 591].)'

be answered easily. 'Death is commonly regarded as the gravest of all misfortunes; hence the dead are believed to be exceedingly dissatisfied with their fate. According to primitive ideas a person only dies if he is killed – by magic if not by force – and such a death naturally tends to make the soul revengeful and ill-tempered. It is envious of the living and is longing for the company of its old friends; no wonder, then, that it sends them diseases to cause their death. . . . But the notion that the disembodied soul [*Seelen*] is on the whole a malicious being . . . is also, no doubt, intimately connected with the instinctive [*instinktiven*][T] fear of the dead, which is in its turn the outcome of the fear of death.'

Instinkt

The study of psychoneurotic disorders suggests a more comprehensive explanation, which at the same time covers that put forward by Westermarck.

[60] When a wife has lost her husband or a daughter her mother, it not infrequently happens that the survivor is overwhelmed by tormenting doubts (to which we give the name of 'obsessive self-reproaches') as to whether she may not herself have been responsible for the death of this cherished being through some act of carelessness or neglect. No amount of recollection of the care she lavished on the sufferer, no amount of objective disproof of the accusation, serves to bring the torment to an end. It may be regarded as a pathological form of mourning, and with the passage of time it gradually dies away. The psychoanalytic investigation of such cases has revealed the secret motives of the disorder. We find that in a certain sense these obsessive self-reproaches are justified, and that this is why they are proof against contradictions and protests. It is not that the mourner was really responsible for the death or was really guilty of neglect, as the self-reproaches declare to be the case. Nonetheless there was something in her – a wish that was unconscious to herself – which would not have been dissatisfied by the occurrence of death and which might actually have brought it about if it had had the power. And after death *has* occurred, it is against this unconscious wish that the reproaches are a reaction. In almost every case where there is an intense emotional attachment to a particular person we find that behind the tender love there is a concealed hostility in the unconscious. This is the classical example, the prototype, of the ambivalence of human emotions. This ambivalence is present to a greater or lesser amount in the innate disposition of everyone; normally, there is not so much of it as to produce the obsessive self-reproaches we are considering. Where, however, it is copiously present in the disposition, it will manifest itself precisely in the subject's relation to those of whom he is most fond, in

the place, in fact, where one would least expect to find it. It must be supposed that the presence of a particularly large amount of this original emotional ambivalence is characteristic of the disposition of obsessional neurotics – whom I have so often brought up for comparison in this discussion upon taboo.

We have now discovered a motive which can explain the idea that the souls of those who have just died are transformed into demons and the necessity felt by survivors to protect themselves by taboos against their [61] hostility. Let us suppose that the emotional life of primitive peoples is characterized by an amount of ambivalence as great as that which we are led by the findings of psychoanalysis to attribute to obsessional patients. It then becomes easy to understand how after a painful bereavement savages should be obliged to produce a reaction against the hostility latent in their unconscious similar to that expressed as obsessive self-reproach in the case of neurotics. But this hostility, distressingly felt in the unconscious as satisfaction over the death, is differently dealt with among primitive peoples. The defence against it takes the form of displacing it on to the object of the hostility, on to the dead themselves. This defensive procedure, which is a common one both in normal and in pathological mental life, is known as a '*projection*'. The survivor thus denies that he has ever harboured any hostile feelings against the dead loved one; the soul of the dead harbours them instead and seeks to put them into action during the whole period of mourning. In spite of the successful defence which the survivor achieves by means of projection, his emotional reaction shows the characteristics of punishment and remorse, for he is the subject of fears and submits to renunciations and restrictions, though these are in part disguised as measures of protection against the hostile demon. Once again, therefore, we find that the taboo has grown up on the basis of an ambivalent emotional attitude. The taboo upon the dead arises, like the others, from the contrast between conscious pain and unconscious satisfaction over the death that has occurred. Since such is the origin of the ghost's resentment, it follows naturally that the survivors who have the most to fear will be those who were formerly its nearest and dearest.

In this respect taboo observances, like neurotic symptoms, have a double sense. On the one hand, in their restrictive character, they are expressions of mourning; but on the other hand they clearly betray – what they seek to conceal – hostility against the dead disguised as self-defence. We have already learnt that certain taboos arise out of fear of temptation. The fact that a dead man is helpless is bound to act as an encouragement

to the survivor to give free rein to his hostile passions, and that temptation must be countered by a prohibition.

[62] Westermarck is right in insisting that savages draw no distinction between violent and natural death. In the view of unconscious thinking, a man who has died a natural death is a murdered man: evil wishes have killed him.[1] Anyone who investigates the origin and significance of dreams of the death of loved relatives (of parents or brothers or sisters) will be able to convince himself that dreamers, children and savages are at one in their attitude towards the dead – an attitude based upon emotional ambivalence.[2]

At the beginning of this essay [p. 31 above] disagreement was expressed with Wundt's opinion [*Auffassung*] that the essence of taboo was a fear of demons. Yet we have now assented to an explanation that derives the taboo upon the dead from a fear of the soul [*Seele*] of the dead person transformed into a demon. The apparent contradiction can easily be resolved. It is true that we have accepted the presence of demons, but not as something ultimate and psychologically unanalysable. We have succeeded, as it were, in getting behind the demons, for we have explained them as projections of hostile feelings harboured by the survivors against the dead.

Both of the two sets of feelings (the affectionate and the hostile), which, as we have good reason to believe, exist towards the dead person, seek to take effect at the time of the bereavement, as mourning and as satisfaction. There is bound to be a conflict between these two contrary feelings; and, since one of the two, the hostility, is wholly or for the greater part unconscious, the outcome of the conflict cannot be to subtract, as it were, the feeling with the lesser intensity from that with the greater and to establish the remainder in consciousness – as occurs, for instance, when one forgives a slight that one has received from someone of whom one is fond. The process is dealt with instead by the special psychical mechanism known in psychoanalysis, as I have said, by the name of 'projection'. The hostility, of which the survivors know nothing and moreover wish to know nothing, is ejected from internal perception

[63] into the external world, and thus detached from them and pushed on to someone else. It is no longer true that they are rejoicing to be rid of the dead man; on the contrary, they are mourning for him; but, strange to say, *he* has turned into a wicked demon ready to gloat over their misfortunes and eager to kill them. It then becomes necessary for them, the

1 Cf. the next essay in this volume.

2 [Cf. Freud, *The Interpretation of Dreams* (1900*a*), *RSE*, **4**, 220 ff.]

survivors, to defend themselves against this evil enemy; they are relieved of pressure from within, but have only exchanged it for oppression from without.

It cannot be disputed that this process of projection, which turns a dead man into a malignant enemy, is able to find support in any real acts of hostility on his part that may be recollected and felt as a grudge against him: his severity, his love of power, his unfairness, or whatever else may form the background of even the tenderest of human relationships. But it cannot be such a simple matter as that. This factor alone cannot explain the creation of demons by projection. The faults of the dead no doubt provide a part of the explanation for the survivors' hostility; but they would not operate in this way unless the survivors had first developed hostility on their own account. The moment of death, moreover, would certainly seem to be a most inappropriate occasion for recalling any justifiable grounds of complaint that might exist. It is impossible to escape the fact that the true determining factor [*treibende Motiv*] is invariably *unconscious* hostility. A hostile current of feeling such as this against a person's nearest and dearest relatives may remain latent during their lifetime, that is, its existence may not be betrayed to consciousness either directly or through some substitute. But when they die this is no longer possible and the conflict becomes acute. The mourning which derives from an intensification of the affectionate feelings becomes on the one hand more impatient of the latent hostility and, on the other hand, will not allow it to give rise to any sense of satisfaction. Accordingly, there follow the repression of the unconscious hostility by the method of projection and the construction of the ceremonial which gives expression to the fear of being punished by the demons. When in course of time the mourning runs its course, the conflict grows less acute, so that the taboo upon the dead is able to diminish in severity or sink into oblivion.

(4)

Having thus explained the basis of the exceedingly instructive taboo [64]
upon the dead, we must not omit to add a few remarks that may help to increase our understanding of taboo in general.

The projection of unconscious hostility on to demons in the case of the taboo upon the dead is only a single instance of a number of processes to which the greatest influence must be attributed in the shaping of the primitive mind. In the case we have been dealing with, projection served the purpose of dealing with an emotional conflict; and it is employed in

the same way in a large number of psychical situations that lead to neuroses. But projection was not created for the purpose of defence; it also occurs where there is no conflict. The projection outwards of internal perceptions is a primitive mechanism, to which, for instance, our sense perceptions are subject, and which therefore normally plays a very large part in determining the form taken by our external world. Under conditions whose nature has not yet been sufficiently established, internal perceptions of emotional and thought processes can be projected outwards in the same way as sense perceptions; they are thus employed for building up the external world, though they should by rights remain part of the *internal* world. This may have some genetic [*genetisch*][T] connection with the fact that the function of attention was originally directed not towards the internal world but towards the stimuli that stream in from the external world, and that that function's only information upon endopsychic processes was received from feelings of pleasure and unpleasure [*Lust- und Unlustentwicklungen*]. It was not until a language of abstract thought had been developed, that is to say, not until the sensory residues of verbal presentations [*Wortvorstellungen*][T] had been linked to the internal processes, that the latter themselves gradually became capable of being perceived. Before that, owing to the projection outwards of internal perceptions, primitive men arrived at a picture of the external world which we, with our intensified conscious perception, have now to translate back into psychology. [Cf. p. 74 *n*. below.]

The projection of their own evil impulses into demons is only one
[65] portion of a system which constituted the *Weltanschauung* [view of the world] of primitive peoples, and which we shall come to know as 'animism' in the following essay. There we shall have to investigate that system's psychological characteristics, and we shall do so once again by reference to the similar systems which we find constructed by neurotics. For the moment I will say only that the prototype of all such systems is what we have termed the 'secondary revision' of the content of dreams.[1] And we must not forget that, at and after the stage at which systems are constructed, two sets of reasons can be assigned for every psychical event that is consciously judged – one set belonging to the system and the other set real but unconscious.[2]

Wundt (1906, 129) remarks that 'among the activities attributed by myths all over the world to demons, the *harmful* predominate, so that in

1 [Cf. Freud, *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 437 ff.]

2 [Further explained below, p. 91 ff.] The projected creations of primitive men resemble the personifications constructed by creative writers; for the latter externalize in the form of separate individuals the opposing drive impulses struggling within them.

popular belief bad demons are clearly older than good ones'. It is quite possible that the whole concept of demons was derived from the important relation of the living to the dead. The ambivalence inherent in that relation was expressed in the subsequent course of human development by the fact that, from the same root, it gave rise to two completely opposed psychical structures [*Bildungen*][T]: on the one hand, fear of demons and ghosts and, on the other hand, veneration of ancestors.[1] The fact that demons are always regarded as the spirits of those who have died *recently* shows better than anything the influence of mourning on the origin of the belief in demons. Mourning has a quite specific psychical task to perform: its function is to detach the survivors' memories and hopes from the dead. When this has been achieved, the pain grows less and with it the remorse and self-reproaches and consequently [66]
the fear of the demon as well. And the same spirits who to begin with were feared as demons may now expect to meet with friendlier treatment; they are revered as ancestors and appeals are made to them for help.

If we follow the changing relations between survivors and the dead through the course of ages, it becomes obvious that there has been an extraordinary diminution in ambivalence. It is now quite easy to keep down the unconscious hostility to the dead (though its existence can still be traced) without any particular expenditure of psychical energy. Where, in earlier times, satisfied hatred and pained affection fought each other, we now find that a kind of scar has been formed in the shape of piety, which declares '*de mortuis nil nisi bonum*'. It is only neurotics whose mourning for the loss of those dear to them is still troubled by obsessive self-reproaches – the secret of which is revealed by psychoanalysis as the old emotional ambivalence. We need not discuss here how this alteration came about or how much share in it is due to a constitutional modification and how much to a real improvement in family relations. But this example suggests the probability that *the psychical impulses of primitive peoples were characterized by a higher amount of ambivalence than is to be found in modern civilized man. It is to be supposed that, as this ambivalence diminished, taboo (a symptom of the ambivalence and a compromise*

1 In the course of psychoanalyses of neurotics who suffer (or who suffered in their childhood) from fear of ghosts, it is often possible to show without much difficulty that the ghosts are disguises for the patient's parents. Cf. in this connection a paper upon 'Sexual Ghosts' by Haeberlin (1912). Here the person concerned was not the subject's parent (who was dead) but someone else of erotic significance to him.

between the two conflicting impulses) slowly disappeared. Neurotics, who are obliged to reproduce the struggle and the taboo resulting from it, may be said to have inherited an archaic constitution as an atavistic vestige; the need to compensate for this at the behest of civilization is what drives them to their immense expenditure of mental energy.

And here we may recall the obscure and puzzling statement by Wundt on the double meaning of the word taboo: 'sacred' and 'unclean'. (See above [pp. 31–2].) Originally, according to him, the word did not possess these two meanings, but described 'what is demonic', 'what may not be touched', thus stressing an important characteristic common to both the extreme concepts. The persistence, however (he added), of this common characteristic was evidence that the ground covered by the two – the
[67] sacred and the unclean – was originally one and did not become differentiated until later.

Our discussions, on the contrary, lead us to the simple conclusion that the word 'taboo' had a double meaning from the very first and that it was used to designate a particular kind of ambivalence and whatever arose from it. 'Taboo' is itself an ambivalent word; and one feels on looking back [*nachträglich*] that the well-attested meaning of the word should alone have made it possible to infer – what has actually been arrived at as a result of extensive researches – that the prohibitions of taboo are to be understood as consequences of an emotional ambivalence. Study of the earliest languages has taught us that there were once many such words, which expressed contrary ideas and in a sense (though not in quite the same sense as the word 'taboo') were ambivalent.[1] Slight modifications in the pronunciation of the antithetical 'primal word' made it possible subsequently to give separate verbal expression to the two contrary ideas which were originally combined in it.

The word 'taboo' met with a different fate. As the importance of the ambivalence denoted by it diminished, the word itself, or rather the words analogous to it, fell out of use. I hope to be able, in a later connection, to make it probable that a definite historical chain of events is concealed behind the fate of this concept: that the word was at first attached to certain quite specific human relations which were characterized by great emotional ambivalence, and that its use then spread on to other analogous relations. [See p. 131 ff. below.]

1 Cf. my review of Abel's 'Antithetical Meaning of Primal Words' (1884) [Freud, 1910*e*; *RSE*, **11**, 143 ff.].

If I am not mistaken, the explanation of taboo also throws light on the nature and origin of *conscience*. It is possible, without any stretching of the sense of the terms, to speak of a taboo conscience or, after a taboo has been violated, of a taboo sense of guilt. Taboo conscience is probably the earliest form in which the phenomenon of conscience is met with.

For what is 'conscience'? On the evidence of language it is related to that of which one is 'most certainly conscious'. Indeed, in some [68] languages the words for 'conscience' and 'consciousness' can scarcely be distinguished.[1]

Conscience is the internal perception of the rejection of a particular wish operating within us. The stress, however, is upon the fact that this rejection has no need to appeal to anything else for support, that it is quite 'certain of itself'. This is even clearer in the case of consciousness of guilt – the perception of the internal condemnation of an act by which we have carried out a particular wish. To put forward any reason for this would seem superfluous: anyone who has a conscience must feel within him the justification for the condemnation, must feel the self-reproach for the act that has been carried out. This same characteristic is to be seen in the savage's attitude towards taboo. It is a command issued by conscience; any violation of it produces a fearful sense of guilt which follows as a matter of course and of which the origin is unknown.[2]

Thus it seems probable that conscience too arose, on a basis of emotional ambivalence, from quite specific human relations to which this ambivalence was attached; and that it arose under the conditions which we have shown to apply in the case of taboo and of obsessional neurosis – namely, that one of the opposing feelings involved shall be unconscious and kept under repression by the compulsive domination of the other one. This conclusion is supported by several things we have learnt from the analysis of neuroses.

In the first place, we have found that a feature in the character of obsessional neurotics is a scrupulous conscientiousness which is a symptom reacting against the temptation lurking in their unconscious. If their illness becomes more acute, they develop a sense of guilt of the most intense degree. In fact, one may venture to say that, if we cannot [69]

1 [E.g. the French '*conscience*', which has both meanings. The German word for 'conscience' is '*Gewissen*', which contains the same root as such words as '*wissen*', 'to know', and '*bewusst*', 'conscious', as well as the word actually used for comparison in this paragraph and the next, '*gewiss*', 'certain' or 'known with certainty'.]

2 The sense of guilt in the case of taboos is not in the least diminished if the violation occurs unwittingly. (Cf. the instances above [p. 47 f.].) An interesting parallel is found in Greek mythology: the guilt of Oedipus was not palliated by the fact that he incurred it without his knowledge and even against his intention.

trace the origin of the sense of guilt in obsessional neurotics, there can be no hope of our *ever* tracing it. This task can be directly achieved in the case of individual neurotic patients, and we may rely upon reaching a similar solution by inference in the case of primitive peoples.

In the second place, we cannot help being struck by the fact that a sense of guilt has about it much of the nature of anxiety: we could describe it without any misgivings as 'dread of conscience'. But the anxiety points to unconscious sources. The psychology of the neuroses has taught us that, if wishful impulses are repressed, their libido is transformed into anxiety. And this reminds us that there is something unknown and unconscious in connection with the sense of guilt, namely the reasons for the act of repudiation. The character of anxiety that is inherent in the sense of guilt corresponds to this unknown factor.[1]

Since taboos are mainly expressed in prohibitions, the underlying presence of a *positive* current of desire may occur to us as something quite obvious and calling for no lengthy proofs based on the analogy of the neuroses. For, after all, there is no need to prohibit something that no-one desires to do, and a thing that is forbidden with the greatest emphasis must be a thing that is desired. If we were to apply this plausible thesis to our primitive peoples, we should be led to the conclusion that some of their strongest temptations were to kill their kings and priests, to commit incest, to maltreat the dead, and so on – which seems scarcely probable. And we should be met with the most positive contradiction if we were to apply the same thesis to instances in which we ourselves seem most clearly to hear the voice of conscience. We should maintain with the most absolute certainty that we feel not the slightest temptation to violate any of these prohibitions – the commandment to 'do no murder', for instance – and that we feel nothing but horror at the notion of violating them.

If, however, we were to admit the claims thus asserted by our
[70] conscience, it would follow, on the one hand, that these prohibitions would be superfluous – both taboo and our own moral prohibitions – and, on the other hand, the fact of conscience would remain unexplained and no place would be left for the relations between conscience, taboo and neurosis. In other words, we should be back in the state of knowledge we were in before we approached the problem from the psychoanalytic angle.

1 [It may be remarked that Freud's views on the origin and nature both of conscience and of anxiety were greatly modified in his later writings. For these later views, see Lectures XXXI and XXXII in his *New Introductory Lectures* (1933*a*), *RSE*, **22**, 53–6 and 96 f.]

Suppose, on the other hand, that we were to take into account the finding arrived at by psychoanalysis from the dreams of normal people, to the effect that we ourselves are subject, more strongly and more often than we suspect, to a temptation to kill someone and that that temptation produces psychical effects even though it remains out of sight of our consciousness. Suppose, again, that we were to recognize the compulsive observances of certain neurotics as being guarantees against an intensified impulse to murder or as being self-punishments on account of it. In that case we should have to attach still greater importance to our thesis that where there is a prohibition there must be an underlying desire. We should have to suppose that the desire to murder is actually present in the unconscious and that neither taboos nor moral prohibitions are psychologically superfluous but that on the contrary they are explained and justified by the existence of an ambivalent attitude towards the impulse to murder.

One of the characteristics of this ambivalent relation which I have repeatedly stressed as fundamental – the fact that the positive current of desire is an unconscious one – opens the way to further considerations and to further possible explanations. Psychical processes in the unconscious are not in every respect identical to those with which our conscious mind is familiar; they enjoy some remarkable liberties that are forbidden to the latter. An unconscious impulse need not have arisen at the point where it makes its appearance; it may arise from some quite other region and have applied originally to quite other persons and connections; it may have reached the place at which it attracts our attention through the mechanism of 'displacement'. Owing, moreover, to the indestructibility and insusceptibility to correction which are attributes of unconscious processes, it may have survived from very early times to which it was [71]
appropriate into later times and circumstances in which its manifestations are bound to seem strange. These are no more than hints, but if they were attentively developed their importance for our understanding of the growth of civilization [*Kulturentwicklung*] would become apparent.

Before I conclude this discussion, a further point must not be overlooked which will pave the way for later inquiries. In maintaining the essential similarity between taboo prohibitions and moral prohibitions, I have not sought to dispute the fact that there must be a psychological difference between them. The only possible reason why the prohibitions no longer

take the form of taboos must be some change in the circumstances governing the ambivalence underlying them.

In our analytical examination of the problems of taboo we have hitherto allowed ourselves to be led by the points of agreement that we have been able to show between it and obsessional neurosis. But after all taboo is not a neurosis but a social institution. We are therefore faced with the task of explaining what difference there is in principle between a neurosis and a cultural creation [*Kulturschöpfung*] such as taboo.

Once again I will take a single fact as my starting point. It is feared among primitive peoples that the violation of a taboo will be followed by a punishment, as a rule by some serious illness or by death. The punishment threatens to fall on whoever was responsible for violating the taboo. In obsessional neuroses the case is different. What the patient fears if he performs some forbidden action is that a punishment will fall not on himself but on someone else. This person's identity is as a rule left unstated, but can usually be shown without difficulty by analysis to be one of those closest and most dear to the patient. Here, then, the neurotic seems to be behaving altruistically and the primitive man egoistically. Only if the violation of a taboo is not automatically avenged upon the wrongdoer does a collective feeling arise among savages that they are all threatened by the outrage; and they thereupon hasten to carry out the omitted punishment themselves. There is no difficulty in explaining the mechanism of this solidarity. What is in question is fear of an infec-
[72] tious example, of the temptation to imitate – that is, of the contagious character of taboo. If one person succeeds in gratifying the repressed desire, the same desire is bound to be kindled in all the other members of the community. In order to keep the temptation down, the envied transgressor must be deprived of the fruit of his enterprise; and the punishment will not infrequently give those who carry it out an opportunity of committing the same outrage under colour of an act of expiation. This is indeed one of the foundations of the human penal system and it is based, no doubt correctly, on the assumption that the prohibited impulses are present alike in the criminal and in the avenging community. In this, psychoanalysis is no more than confirming the habitual pronouncement of the pious: we are all miserable sinners.

How, then, are we to account for the unexpected nobility of mind of the neurotic, who fears nothing on his own account but everything for someone he loves? Analytical enquiry shows that this attitude is not

primary. Originally, that is to say at the beginning of the illness, the threat of punishment applied, as in the case of savages, to the patient himself; he was invariably in fear for his own life; it was not until later that the mortal fear was displaced on to another and a loved person. The process is a little complicated, but we can follow it perfectly. At the root of the prohibition there is invariably a hostile impulse against someone the patient loves – a wish that that person should die. This impulse is repressed by a prohibition and the prohibition is attached to some particular act, which, by displacement, represents, it may be, a hostile act against the loved person. There is a threat of death if this act is performed. But the process goes further, and the original *wish* that the loved person may die [*Todeswunsch*] is replaced with a *fear* that he may die [*Todesangst*]. So that when the neurosis appears to be so tenderly altruistic, it is merely *compensating* for an underlying contrary attitude of brutal egoism. We may describe as 'social' the emotions which are determined by showing consideration for another person without taking him as a sexual object. The receding into the background of these social factors may be stressed as a fundamental characteristic of the neurosis, though one which is later disguised by overcompensation.

I do not propose to linger over the origin of these social impulses and [73]
their relation to the other basic human drives but shall proceed to illustrate the second main characteristic of the neurosis by means of another example. In the forms which it assumes, taboo very closely resembles the neurotic's fear of touching, his 'touching phobia'. Now, in the case of the neurosis the prohibition invariably relates to touching of a *sexual* kind, and psychoanalysis has shown that it is in general true that the drive forces that are diverted and displaced in neuroses have a sexual origin. In the case of taboo the prohibited touching is obviously not to be understood in an exclusively sexual sense but in the more general sense of attacking, of getting control, and of asserting oneself. If there is a prohibition against touching a chief or anything that has been in contact with him, this means that an inhibition is to be laid on the same impulse which expresses itself on the other occasions in keeping a suspicious watch upon the chief or even in ill-treating him physically before his coronation. (See above [p. 53].) *Thus the fact which is characteristic of the neurosis is the preponderance of the sexual over the social drive elements*. The social drives, however, are themselves derived from a combination of egoistic and erotic components into wholes of a special kind.

This single comparison between taboo and obsessional neurosis is enough to enable us to gather the nature of the relation between the

different forms of neurosis and cultural institutions, and to see how it is that the study of the psychology of the neuroses is important for an understanding of the growth of civilization.

The neuroses exhibit on the one hand striking and far-reaching points of agreement with those great social institutions, art, religion and philosophy. But on the other hand they seem like distortions of them. It might be maintained that a case of hysteria is a caricature of a work of art, that an obsessional neurosis is a caricature of a religion and that a paranoic delusion is a caricature of a philosophical system. The divergence resolves itself ultimately into the fact that the neuroses are asocial structures; they endeavour to achieve by private means what is effected in society by collective effort. If we analyse the drives at work in the neuroses, we find that the determining influence in them is exercised by drive [74] forces of sexual origin; the corresponding cultural formations, on the other hand, are based upon social drives, originating from the combination of egoistic and erotic elements. Sexual needs are not capable of uniting men in the same way as are the demands of self-preservation. Sexual satisfaction is essentially the private affair of each individual.

The asocial nature of neuroses has its genetic origin in their most fundamental purpose, which is to take flight from an unsatisfying reality into a more pleasurable world of phantasy. The real world, which is avoided in this way by neurotics, is under the sway of human society and of the institutions collectively created by it. To turn away from reality is at the same time to withdraw from the community of man.[1]

1 [Many of the points of comparison in this essay between taboo and obsessional neurosis can be found illustrated in the case history of the 'Rat Man' (1909*d*), *RSE*, **10**, 171 f. The subject of taboo was further discussed by Freud in 'The Taboo of Virginity' (1918*a*), ibid., **11**, 183 ff. – On the question of man's attitude to death, see also 'Thoughts for the Times on War and Death' (1915*b*), ibid., **14**, 275 ff. – The remarks on attention on p. 65 f. above may be made clearer by a passage in Chapter VII (D) of *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 513 f. See also Part III, Section 1 of the 'Project' of 1895; ibid., **1**, 384 ff. – The opposition between directly sexual impulsions and social structures is elaborated in Chapter XII (D) of *Group Psychology* (1921*c*), ibid., **18**, 130–2.]

III
ANIMISM, MAGIC AND THE OMNIPOTENCE OF THOUGHTS

(1)

Writings that seek to apply the findings of psychoanalysis to topics in the [75]
field of the mental sciences [*Geisteswissenschaften*] have the inevitable defect of offering too little to readers of both classes. Such writings can only be in the nature of an instigation: they put before the specialist certain suggestions for him to take into account in his own work. This defect is bound to be extremely evident in an essay which will attempt to deal with the immense domain of what is known as '*animism*'.[1]

Animism is, in its narrower sense, the doctrine of souls [*Seelenvorstellungen*], and, in its wider sense, the doctrine of spiritual beings [*geistigen Wesen*] in general. The term 'animatism' has also been used to denote the theory of the living character of what appear to us to be inanimate objects [see below, p. 89], and the terms 'animalism' and 'manism' occur as well in this connection. The word 'animism', originally used to describe a particular philosophical system, seems to have been given its present meaning by Tylor.[2]

What led to the introduction of these terms was a realization of the highly remarkable view of nature and the world adopted by the primitive races of whom we have knowledge, whether in past history or at the [76]
present time. They people the world with innumerable spiritual beings both benevolent and malignant; and these spirits [*Geistern*] and demons they regard as the causes of natural phenomena and they believe that not only animals and plants but all the inanimate objects in the world are animated by them. A third, and perhaps the most important, article of this primitive 'philosophy of nature'[3] strikes us as less strange, since, while we have retained only a very limited belief in the existence of spirits [*Geister*] and explain natural phenomena by the agency of

1 The necessity for a concise treatment of the material involves the omission of any elaborate bibliography. Instead, I will merely refer to the standard works of Herbert Spencer, J. G. Frazer, Andrew Lang, E. B. Tylor and Wilhelm Wundt, from which all that I have to say about animism and magic is derived. My own contribution is visible only in my selection both of material and of opinions.

2 Cf. Tylor (1891, **1**, 425), Wundt (1906, [142 f. and] 173) [and Marett (1900, 171)].

3 ['*Naturphilosophie*', the pantheistic philosophy of Schelling.]

impersonal physical forces, we ourselves are not very far removed from this third belief. For primitive peoples believe that human individuals are inhabited by similar spirits [*Beseelung*]. These souls [*Seelen*] which live in human beings can leave their habitations and migrate into other human beings; they are the vehicle of mental activities [*geistigen Tätigkeiten*] and are to a certain extent independent of their bodies. Originally souls [*Seelen*] were pictured as very similar to persons and only in the course of a long development have they lost their material characteristics and become to a high degree 'spiritualized' [*Vergeistigung*].[1]

Most authorities incline to the view that these ideas of a soul are the original nucleus of the animistic system, that spirits are only souls that have made themselves independent, and that the souls of animals, plants and objects were constructed on the analogy of human souls.

How did primitive man arrive at the peculiar dualistic views on which the animistic system is based? It is supposed that he did so by observing the phenomena of sleep (including dreams) and of death which so much resembles it, and by attempting to explain those states, which are of such close concern to everyone. The chief starting point of this theorizing must have been the problem of death. What primitive man regarded as the natural thing was the indefinite prolongation of life – immortality. The idea [*Vorstellung*] of death was only accepted late, and with hesitancy. Even for us it is lacking in content and has no clear connotation. There have been very lively but inconclusive discussions upon the part that may have been played in the formation of the basic doctrines of
[77] animism by such other observed or experienced facts as dream pictures, shadows, mirror images, and so on.[2]

It has been regarded as perfectly natural and not in the least puzzling that primitive man should have reacted to the phenomena which aroused his speculations by forming [*Bildung*] the idea of the soul and then of extending it to objects in the external world. In discussing the fact that the same animistic ideas have emerged among the most various races and at every period, Wundt (1906, 154) declares that 'they are the necessary psychological product of a mythopoeic consciousness . . . and in this sense, therefore, primitive animism must be regarded as the spiritual expression of the natural state of man, so far as it is accessible to our observation'. The justification for attributing life to inanimate objects was already stated by Hume in his *Natural History of Religion* [Section III]: 'There is an universal tendency among mankind to

1 Wundt (1906), Chapter IV, 'Die Seelenvorstellungen'.

2 Cf. Wundt [loc. cit.], Herbert Spencer [1893, Part I], as well as the general articles in the *Encyclopaedia Britannica* (1910–11) on 'Animism', 'Mythology', etc.

conceive all beings like themselves, and to transfer to every object those qualities with which they are familiarly acquainted, and of which they are intimately conscious.'[1]

Animism is a system of thought. It does not merely give an explanation of a particular phenomenon, but allows us to grasp the whole world as a single unity from a single point of view. The human race, if we are to follow the authorities, have in the course of ages developed three such systems of thought – three great pictures of the world: animistic (or mythological), religious and scientific. Of these, animism, the first to be created, is perhaps the one which is most consistent and exhaustive and which gives a truly complete explanation of the nature of the world. This first human *Weltanschauung* is a *psychological* theory. It would go beyond our present purpose to show how much of it still persists in modern life, either in the debased form of superstition or as the living basis of our language [*Sprechens*], our beliefs and our philosophies.

With these three stages in mind, it may be said that animism itself is not yet a religion but contains the foundations on which religions are later built. It is obvious, too, that myths are based on animistic premises, [78] though the details of the relation between myths and animism seem to be unexplained in some essential respects.

(2)

Our psychoanalytic approach to the subject, however, is from another side. It is not to be supposed that men were inspired to create their first system of the world by pure speculative curiosity. The practical need for controlling the world around them must have played its part. So we are not surprised to learn that, hand in hand with the animistic system, there went a body of instructions upon how to obtain mastery over men, beasts and things – or rather, over their spirits. These instructions go by the names of 'sorcery' and 'magic'.[2] Reinach (1905–12, **2**, xv) describes them as the 'strategy of animism'; I should prefer, following Hubert & Mauss (1904, [142 ff.]), to regard them as its technique.

Can the concepts of sorcery and magic be distinguished? Perhaps – if we are prepared to show a somewhat arbitrary disregard for the fluctuations of linguistic usage. Sorcery, then, is essentially the art of influencing spirits by treating them in the same way as one would treat men in like circumstances: appeasing them, making amends to them,

1 Quoted by Tylor (1891, **1**, 477).

2 ['*Zauberei*' and '*Magie*' in the original.]

propitiating them, intimidating them, robbing them of their power, subduing them to one's will – by the same methods that have proved effective with living men. Magic, on the other hand, is something different: fundamentally, it disregards spirits and makes use of special procedures and not of everyday psychological methods. It is easy to guess that magic is the earlier and more important branch of animistic technique; for magical methods can, among others, be used in dealing with spirits,[1] and magic can be applied as well in cases where, as it seems to us, the process of spiritualizing Nature has not yet been carried out.

Magic has to serve the most varied purposes – it must subject natural
[79] phenomena to the will of man, it must protect the individual from his enemies and from dangers and it must give him power to injure his enemies. But the principle on the presumption of which magical action is based – or, more properly, the principle of magic – is so striking that none of the authorities has failed to recognize it. Tylor [1891, **1**, 116], if we leave on one side an accompanying moral judgement, states it in its most succinct form as mistaking an ideal connection for a real one. I will illustrate this feature from two groups of magical acts.

One of the most widespread magical procedures for injuring an enemy is by making an effigy of him from any convenient material. Whether the effigy resembles him is of little account: any object can be 'made into' an effigy of him. Whatever is then done to the effigy, the same thing happens to the detested original; whatever part of the former's body is damaged, the same part of the latter's becomes diseased. The same magical technique may be employed, not only for purposes of private enmity, but also for pious ends and for giving help to gods against malignant demons. I will quote from Frazer (1911*a*, **1**, 67): 'Every night when the sun-god Ra sank down to his home in the glowing west he was assailed by hosts of demons under the leadership of the arch-fiend Apepi. All night long he fought them, and sometimes by day the powers of darkness sent up clouds even into the blue Egyptian sky to obscure his light and weaken his power. To aid the sun-god in this daily struggle, a ceremony was daily performed in his temple at Thebes. A figure of his foe Apepi, represented as a crocodile with a hideous face or a serpent with many coils, was made of wax, and on it the demon's name was written in green ink. Wrapt in a papyrus case, on which another likeness of Apepi had been drawn in green ink, the figure was then tied up with black hair, spat upon, hacked

1 If a spirit is scared away by making a noise and shouting, the action is one purely of sorcery; if compulsion is applied to it by getting hold of its name, magic has been used against it.

with a stone knife, and cast on the ground. There the priest trod on it with his left foot again and again, and then burnt it in a fire made of a certain plant or grass. When Apepi himself had thus been effectually disposed of, waxen effigies of each of his principal demons, and of their fathers, mothers and children, were made and burnt in the same way. The service, accompanied by the recitation of certain prescribed spells, was repeated not merely morning, noon and night, but whenever a storm [80] was raging, or heavy rain had set in, or black clouds were stealing across the sky to hide the sun's bright disc. The fiends of darkness, clouds, and rain felt the injuries inflicted on their images as if they had been done to themselves; they passed away, at least for a time, and the beneficent sun-god shone out triumphant once more.'[1]

From the vast number of magical acts having a similar basis I will draw attention to only two more, which have played a large part among primitive peoples of every age and which persist to some degree in the myths and cults of higher stages of civilization – that is, rituals for producing rain and fertility. Rain is produced magically by imitating it or the clouds and storms which give rise to it, by 'playing at rain', one might almost say. In Japan, for instance, 'a party of Ainos will scatter water by means of sieves, while others will take a porringer, fit it up with sails and oars as if it were a boat, and then push or draw it about the village and gardens.'[2] In the same way, the fertility of the earth is magically promoted by a dramatic representation of human intercourse. Thus, to take one from a countless number of instances, 'in some parts of Java, at the season when the bloom will soon be on the rice, the husbandman and his wife visit their fields by night and there engage in sexual intercourse' to encourage the fertility of the rice by their example.[3] There is a dread, however, that prohibited, incestuous sexual relations may cause a failure of the crops and make the earth sterile.[4]

Certain negative observances, that is, magical precautions, must be included in this first group. 'When a Dyak village has turned out to hunt wild pigs in the jungle, the people who stay at home may not touch oil or water with their hands during the absence of their friends; for if they did so, the hunters would all be "butter-fingered" and the prey would slip

1 It seems probable that the biblical prohibition against making an image of any living thing originated, not from any objection to the plastic arts, but from a desire to deprive magic (which was abominated by the Hebrew religion) of one of its tools. Cf. Frazer (1911*a*, **1**, 87 *n*.).

2 [Frazer (1911*a*, **1**, 251), quoting Batchelor (1901, 333).]

3 Frazer (1911*a*, **2**, 98) [quoting Wilken (1884, 958)].

4 An echo of this is to be found in the *Oedipus Rex* of Sophocles [e.g. in the prologue and first Chorus].

[81] through their hands.'[1] Or again, 'while a Gilyak hunter is pursuing game in the forest, his children at home are forbidden to make drawings on wood or on sand; for they fear that if the children did so, the paths in the forest would become as perplexed as the lines in the drawings, so that the hunter might lose his way and never return.'[2]

In these last, as in so many other instances of the workings of magic, the element of distance is disregarded; in other words, telepathy is taken for granted. We shall find no difficulty, therefore, in understanding this characteristic of magic.

There can be no doubt what is to be regarded as the operative factor in all these examples. It is the *similarity* between the act performed and the result expected. For this reason Frazer describes this sort of magic as 'imitative' or 'homoeopathic'. If I wish it to rain, I have only to do something that looks like rain or is reminiscent of rain. At a later stage of civilization, instead of this rain magic, processions will be made to a temple and prayers for rain will be addressed to the deity living in it. Finally, this religious technique will in its turn be given up and attempts will be made to produce effects in the atmosphere which will lead to rain.

In a second group of magical acts the principle of similarity plays no part, and its place is taken by another one, the nature of which will at once become clear from the following examples.

There is another procedure by which an enemy can be injured. One gets possession of some of his hair or nails or other waste products or even a piece of his clothing, and treats them in some hostile way. It is then exactly as though one had got possession of the man himself; and he himself experiences whatever it is that has been done to the objects that originated from him. In the view of primitive man, one of the most important parts of a person is his name. So that if one knows the name of a man or of a spirit, one has obtained a certain amount of power over the owner of the name. This is the origin of the remarkable precautions and restrictions in the use of names which we have already touched upon
[82] in the essay on taboo. (See p. 57 ff.) In these examples the place of similarity is evidently taken by affinity.

The higher motives for cannibalism among primitive races have a similar origin. By incorporating parts of a person's body through the act of eating, one at the same time acquires the qualities possessed by him. This leads in certain circumstances to precautions and restrictions in regard

1 Frazer (1911*a*, **1**, 120) [quoting Roth (1896, **1**, 430)].

2 Frazer (1911*a*, **1**, 122) [quoting Labbé (1903, 268)].

to diet. A woman who is with child will avoid eating the flesh of certain animals for fear that any undesirable qualities they may have (cowardice, for instance) might be passed over to the child that is nourished by her. The magical power is not affected even if the connection between the two objects has already been severed or even if the contact occurred only on a single important occasion. For instance, the belief that there is a magical bond between a wound and the weapon which caused it may be traced unaltered for thousands of years. If a Melanesian can obtain possession of the bow which caused his wound, he will keep it carefully in a cool place so as to reduce the inflammation of the wound. But if the bow was left in the enemy's possession, it will undoubtedly be hung up close to the fire so that the wound may become thoroughly hot and inflamed.[1] Pliny (in his *Natural History*, Book xxviii [Chapter 7]) tells us that 'if you have wounded a man and are sorry for it, you have only to spit on the hand that gave the wound, and the pain of the sufferer will be instantly alleviated'. [Frazer, 1911*a*, **1**, 201.] Francis Bacon (in his *Sylva Sylvarum* [X, §998]) mentions that 'it is constantly received and avouched that the anointing of the weapon that maketh the wound will heal the wound itself'. English country people are said even today to follow this prescription, and if they cut themselves with a scythe carefully keep the instrument clean, to prevent the wound from festering. 'At Norwich in June 1902 a woman named Matilda Henry accidentally ran a nail into her foot. Without examining the wound, or even removing her stocking, she caused her daughter to grease the nail, saying that if this were done no harm would come of the hurt. A few days afterwards she died of lockjaw' – as a result of this displaced antisepsis. (Frazer, ibid., 203.)

The last group of instances exemplifies what Frazer distinguishes from [83]
'imitative' magic under the name of 'contagious' magic. What is believed to be their effective principle is no longer similarity but spatial connection, contiguity, or at least *imagined* contiguity – the recollection of it. Since, however, similarity and contiguity are the two essential principles of processes of association, it appears that the true explanation of all the folly of magical observances is the domination of the association of ideas. The aptness of Tylor's description of magic which I have already quoted [p. 78 above] now becomes evident: mistaking an ideal connection for a real one. Frazer (1911*a*, **1**, 420) has put it almost in the same words: 'Men mistook the order of their ideas for

1 [Frazer (1911*a*, **1**, 201), quoting Codrington (1891, 310).]

the order of nature, and hence imagined that the control which they have, or seem to have, over their thoughts, permitted them to exercise a corresponding control over things.'

We shall at first be surprised to learn that this illuminating explanation of magic has been rejected by some writers as unsatisfactory (e.g. Thomas, 1910–11*a*). On reflection, however, it will be seen that the criticism is justified. The associative theory of magic merely explains the paths along which magic proceeds; it does not explain its true essence, namely the misunderstanding which leads it to replace the laws of nature with psychological ones. Some dynamic factor is evidently missing. But whereas the critics of Frazer's theory have gone astray in their search for it, it will be easy to arrive at a satisfactory explanation of magic merely by carrying the associative theory further and deeper.

Let us consider first the simpler and more important case of imitative magic. According to Frazer (1911*a*, **1**, 54) it can be practised by itself, whereas contagious magic as a rule presupposes the other. It is easy to perceive the motives which lead men to practise magic: they are human wishes. All we need to suppose is that primitive man had an immense belief in the power of his wishes. The basic reason why what he sets about by magical means comes to pass is, after all, simply that he wills it. To begin with, therefore, the emphasis is only upon his wish.

Children are in an analogous psychical situation, though their motor
[84] efficiency is still undeveloped. I have elsewhere (1911*b*) put forward the hypothesis that, to begin with, they satisfy their wishes in a hallucinatory manner, that is, they create a satisfying situation by means of centrifugal excitations of their sense organs. An adult primitive man has an alternative method open to him. His wishes are accompanied by a motor impulse, the will, which is later destined to alter the whole face of the earth in order to satisfy his wishes. This motor impulse is at first employed to give a representation of the satisfying situation in such a way that it becomes possible to experience the satisfaction by means of what might be described as motor hallucinations. This kind of representation of a satisfied wish is quite comparable to children's play, which succeeds their earlier purely sensory technique of satisfaction. If children and primitive men find play and imitative representation enough for them, that is not a sign of their being unassuming in our sense or of their resignedly accepting their actual impotence. It is the easily understandable result of the paramount virtue they ascribe to their wishes, of the will that is associated with those wishes and of the methods by which those wishes

operate. As time goes on, the psychological accent shifts from the *motives* for the magical act on to the *measures* by which it is carried out – that is, on to the act itself. (It would perhaps be more correct to say that it is only these measures that reveal to the subject the excessive valuation which he attaches to his psychical acts.) It thus comes to appear as though it is the magical act itself which, owing to its similarity with the desired result, alone determines the occurrence of that result. There is no opportunity, at the stage of animistic thinking, for showing any objective evidence of the true state of affairs. But a possibility of doing so *does* arrive at a later time, when, though all of these procedures are still being carried out, the psychical phenomenon of doubt has begun to emerge as an expression of a tendency to repression. At that point, men will be ready to admit that conjuring up spirits has no result unless it is accompanied by faith, and that the magical power of prayer fails if there is no piety at work behind it.[1]

The fact that it has been possible to construct a system of contagious [85]
magic on associations of contiguity shows that the importance attached to wishes and to the will has been extended from them on to all those psychical acts which are subject to the will. A general overvaluation has thus come about of all mental processes – an attitude towards the world, that is, which, in view of our knowledge of the relation between reality and thought, cannot fail to strike *us* as an overvaluation of the latter. Things become less important than ideas of things: whatever is done to the latter will inevitably also occur to the former. Relations which hold between the ideas of things are assumed to hold equally between the things themselves. Since distance is of no importance in thinking – since what lies furthest apart both in time and space can without difficulty be comprehended in a single act of consciousness – so, too, the world of magic has a telepathic disregard for spatial distance and treats past situations as though they were present. In the animistic epoch the reflection of the internal world is bound to blot out the other picture of the world – the one which *we* seem to perceive.

It is further to be noticed that the two principles of association – similarity and contiguity – are both included in the more comprehensive concept of 'contact'. Association by contiguity is contact in the literal sense; association by similarity is contact in the metaphorical sense. The use of the same word for the two kinds of relation is no doubt accounted for by some identity in the psychical processes concerned which we have

1 Cf. the King in *Hamlet* (Act III, Scene 3):

> My words fly up, my thoughts remain below:
> Words without thoughts never to heaven go.

not yet grasped. We have here the same range of meaning of the idea of 'contact' as we found in our analysis of taboo. (Cf. p. 33 f.)

By way of summary, then, it may be said that the principle governing magic, the technique of the animistic mode of thinking, is the principle of the 'omnipotence of thoughts'.

(3)

I have adopted the term 'omnipotence of thoughts' from a highly intelligent man who suffered from obsessional ideas and who, after having been set right by psychoanalytic treatment, was able to give evidence of
[86] his efficiency and good sense. (Cf. Freud, 1909*d*.[1]) He had coined the phrase as an explanation for all the strange and uncanny events by which he, like others afflicted with the same illness, seemed to be pursued. If he thought of someone, he would be sure to meet that very person immediately afterwards, as though by magic. If he suddenly asked after the health of an acquaintance whom he had not seen for a long time, he would hear that he had just died, so that it would look as though a telepathic message had arrived from him. If, without any really serious intention, he swore at some stranger, he might be sure that the man would die soon afterwards, so that he would feel responsible for his death. In the course of the treatment he himself was able to tell me how the deceptive appearance arose in most of these cases, and by what contrivances he himself had helped to strengthen his own superstitious beliefs. All obsessional neurotics are superstitious in this way, usually against their better judgement.[2]

It is in obsessional neuroses that the survival of the omnipotence of thoughts is most clearly visible and that the consequences of this primitive mode of thinking come closest to consciousness. But we must not be misled into supposing that it is a distinguishing feature of this particular neurosis, for analytic investigation reveals the same thing in the other neuroses as well. In all of them what determines the formation of symptoms is the reality not of experience but of thought. Neurotics live in a world apart, where, as I have said elsewhere [1911*b*; *RSE*, **12**, 221], only 'neurotic currency' is legal tender; that is to say, they are only affected by what is thought with intensity and pictured

1 [This was the 'Rat Man'. Cf. *RSE*, **10**, 177 ff.]

2 We appear to attribute an 'uncanny' quality to impressions that seek to confirm the omnipotence of thoughts and the animistic mode of thinking in general, after we have reached a stage at which, in our *judgement*, we have abandoned such beliefs. [Cf. Freud's subsequent paper on 'The "Uncanny"' (1919*h*), ibid., **17**, 215 ff.]

with emotion, whereas agreement with external reality is a matter of no importance. What hysterics repeat in their attacks and fix by means of their symptoms are experiences which have occurred in that form only in their imagination [*Phantasie*] – though it is true that in the last resort those imagined experiences go back to actual events or are based upon them. To attribute the neurotic sense of guilt to real mis- [87]
deeds would show an equal misunderstanding. An obsessional neurotic may be weighed down by a sense of guilt that would be appropriate in a mass-murderer, while in fact, from his childhood onwards, he has behaved to his fellow men as the most considerate and scrupulous member of society. Nevertheless, his sense of guilt has a justification: it is founded on the intense and frequent death wishes against his fellows which are unconsciously at work in him. It has a justification if what we take into account are unconscious thoughts and not intentional deeds. Thus the omnipotence of thoughts, the overvaluation of mental processes as compared with reality, is seen to have unrestricted play in the emotional life of neurotic patients and in everything that derives from it. If one of them undergoes psychoanalytic treatment, which makes what is unconscious in him conscious, he will be unable to believe that thoughts are free and will constantly be afraid of expressing evil wishes, as though their expression would lead inevitably to their fulfilment. This behaviour, as well as the superstitions which he practises in ordinary life, reveals his resemblance to the savages who believe they can alter the external world by mere thinking.

The primary obsessive acts of these neurotics are of an entirely magical character. If they are not charms, they are at all events countercharms, designed to ward off the expectations of disaster with which the neurosis usually starts. Whenever I have succeeded in penetrating the mystery, I have found that the expected disaster was death. Schopenhauer has said that the problem of death stands at the outset of every philosophy; and we have already seen [p. 76 above] that the origin of the belief in souls and in demons, which is the essence of animism, goes back to the impression which is made upon men by death. It is difficult to judge whether the obsessive or protective acts performed by obsessional neurotics follow the law of similarity (or, as the case may be, of contrast); for as a rule, owing to the prevailing conditions of the neurosis, they have been distorted by being displaced on to something very small, some action in itself of the greatest triviality.[1]

1 A further motive for such displacement on to a very small action will appear in what follows. [Cf. *RSE*, **10**, 182 f.]

[88] The protective formulas of obsessional neuroses, too, have their counterpart in the formulas of magic. It is possible, however, to describe the course of development of obsessive acts: we can show how they begin by being as remote as possible from anything sexual – magical defences against evil wishes – and how they end by being substitutes for the forbidden sexual act and the closest possible imitations of it.

If we are prepared to accept the account given above of the evolution of human views of the world – an animistic phase followed by a *religious* phase and this in turn by a scientific one – it will not be difficult to follow the vicissitudes [*Schicksale*][T] of the 'omnipotence of thoughts' through these different phases. At the animistic stage men ascribe omnipotence to *themselves*. At the religious stage they transfer it to the gods but do not seriously abandon it themselves, for they reserve the power of influencing the gods in a variety of ways according to their wishes. The scientific view of the world no longer affords any room for human omnipotence; men have acknowledged their smallness and submitted resignedly to death and to the other necessities of nature. Nonetheless some of the primitive belief in omnipotence still survives in men's faith in the power of the human mind, which grapples with the laws of reality.

If we trace back the development of libidinal trends as we find them in the individual from their adult forms to the first beginnings in childhood, an important distinction emerges, which I have described in my *Three Essays on the Theory of Sexuality* (1905*d*). Manifestations of the sexual drives can be observed from the very first, but to begin with they are not yet directed towards any external object. The separate drive components of sexuality work independently of one another to obtain pleasure and find satisfaction in the subject's own body. This stage is known as that of *auto-erotism* and it is succeeded by one in which an *object* is chosen.

Further study has shown that it is expedient and indeed indispensable to insert a third stage between these two, or, putting it in another way, to divide the first stage, that of auto-erotism, into two. At this intermediate stage, the importance of which is being made more and more evident by research, the hitherto isolated sexual drives have
[89] already come together into a single whole and have also found an object. But this object is not an external one, extraneous to the subject, but it is his own ego [*Ich*][T], which has been constituted at about this same time. Bearing in mind pathological fixations of this new stage, which become observable later, we have given it the name of 'narcissism'. The subject behaves as though he were in love with

himself; his egoistic drives [*Ichtriebe*] and his libidinal wishes are not yet separable under our analysis.

Although we are not yet in a position to describe with sufficient accuracy the characteristics of this narcissistic stage, at which the hitherto dissociated sexual drives come together into a single unity and cathect [*besetzen*][T] the ego as an object, we suspect already that this narcissistic organization is never wholly abandoned. A human being remains to some extent narcissistic even after he has found external objects for his libido. The cathexes of objects which he effects are as it were emanations of the libido that still remains in his ego and can be drawn back into it once more. The state of being in love, which is psychologically so remarkable and is the normal prototype of the psychoses, shows these emanations at their maximum compared to the level of self-love [*Ichliebe*].[1] *Besetzung*

Primitive men and neurotics, as we have seen, attach a high valuation – in our eyes an *over*valuation – to psychical acts. This attitude may plausibly be brought into relation with narcissism and regarded as an essential component of it. It may be said that in primitive men the process of thinking is still to a great extent sexualized. This is the origin of their belief in the omnipotence of thoughts, their unshakeable confidence in the possibility of controlling the world and their inaccessibility to the experiences, so easily obtainable, which could teach them man's true position in the world. As regards neurotics, we find that, on the one hand, a considerable part of this primitive attitude has survived in their constitution, and, on the other hand, that the sexual repression that has occurred in them has brought about a further sexualization of their thinking processes. The psychological results must be the same in both cases, whether the libidinal hypercathexis [*Überbesetzung*] of thinking is an original one or has been produced by regression: intellectual narcissism and the omnipotence of thoughts.[2] [90]

If we may regard the existence among primitive races of the omnipotence of thoughts as evidence in favour of narcissism, we are encouraged to attempt a comparison between the phases in the development of men's view of the world and the stages of an individual's libidinal development. The animistic phase would correspond to narcissism both chronologically and in its content; the religious phase would

1 [The whole question of narcissism was discussed at length by Freud later on in his paper 'On Narcissism: an Introduction' (1914*c*), *RSE*, **14**, 63 ff.]

2 'It is almost an axiom with writers on this subject, that a sort of Solipsism, or Berkleianism (as Professor Sully terms it as he finds it in the Child), operates in the savage to make him refuse to recognize death as a fact.' (Marett, 1900, 178.)

correspond to the stage of object choice of which the characteristic is a child's attachment to his parents; while the scientific phase would have an exact counterpart in the stage at which an individual has reached maturity, has renounced the pleasure principle, adjusted himself to reality and turned to the external world for the object of his desires.[1]

In only a single field of our civilization [*Kultur*] has the omnipotence of thoughts been retained, and that is in the field of art. Only in art does it still happen that a man who is consumed by desires performs something resembling the accomplishment of those desires and that what he does in play produces emotional effects – thanks to artistic illusion – just as though it were something real. People speak with justice of the 'magic of art' and compare artists to magicians. But the comparison is perhaps more significant than it claims to be. There can be no doubt that art did not begin as art for art's sake. It worked originally in the service of impulses which are for the most part extinct today. And among them we may suspect the presence of many magical purposes.[2]

(4)

[91] Thus the first picture which man formed of the world [*Weltauffassung*] – animism – was a psychological one. It needed no scientific basis as yet, since science begins only after it has been realized that the world is unknown and that means must therefore be sought for getting to know it. Animism came to primitive man naturally and as a matter of course. He knew what things were like in the world, namely just as he felt himself to be. We are thus prepared to find that primitive man transposed the structural conditions of his own mind[3] into the external world; and

1 I will only briefly allude here to the fact that the original narcissism of children has a decisive influence upon our view of the development of their character and excludes the possibility of their having any primary sense of inferiority [as Adler (1910) suggested (see Part III of Freud, 1914*d*; *RSE*, **14**)].

2 Cf. Reinach, 'L'art et la magie' (1905–12, **1**, 125–36). In Reinach's opinion the primitive artists who left behind the carvings and paintings of animals in the French caves did not desire to 'please' but to 'evoke' or conjure up. He thus explains why it is that these pictures are situated in the darkest and most inaccessible parts of the caves and that dangerous beasts of prey do not appear among them. 'Les modernes parlent souvent, par hyperbole, de la magie du pinceau ou du ciseau d'un grand artiste et, en général, de la magie de l'art. Entendu au sens propre, qui est celui d'une contrainte mystique exercée par la volonté de l'homme sur d'autres volontés ou sur les choses, cette expression n'est plus admissible; mais nous avons vu qu'elle était autrefois rigoureusement vraie, du moins dans l'opinion des artistes.' (Ibid., 136.) ['In modern times people often speak metaphorically of the magic of a great artist's brush or chisel, or more generally of the magic of art. This expression is no longer permissible in its proper sense of a mystical force brought to bear by the human will upon other wills or upon objects; but, as we have seen, there was a time when it was literally true – at least in the artists' opinion.']

3 Which he was aware of by what is known as endopsychic perception.

we may attempt to reverse the process and put back into the human mind what animism teaches as to the nature of things.

The technique of animism, magic, reveals in the clearest and most unmistakable way an intention to impose the laws governing mental life upon real things; in this, spirits need not as yet play any part, though spirits may be taken as objects of magical treatment. Thus the assumptions of magic are more fundamental and older than the doctrine of spirits, which forms the kernel of animism. Our psychoanalytic point of view coincides here with a theory put forward by R. R. Marett (1900), who postulates a pre-animistic stage before animism, the character of which is best indicated by the term 'animatism', the doctrine of the universality of life. Experience has little light to throw on pre-animism, since no race has yet been discovered which is without the concept of spirits. (Cf. Wundt, 1906, 171 ff.)

Whereas magic still reserves omnipotence solely for thoughts, animism [92]
hands some of it over to spirits and so prepares the way for the construction [*Bildung*] of a religion. What, we may ask, can have induced primitive man to make this first act of renunciation? It can scarcely have been a recognition of the falseness of his premises, for he continued to practise the magical technique.

Spirits and demons, as I have shown in the last essay, are only projections of man's own emotional impulses.[1] He turns his emotional cathexes into persons, he peoples the world with them and meets his internal mental processes again outside himself – in just the same way as that intelligent paranoic, Schreber, found a reflection of the attachments and detachments of his libido in the vicissitudes of his confabulated 'rays of God'.[2]

I propose to avoid (as I have already done elsewhere[3]) entering into the general problem of the origin of the tendency to project mental processes into the outside. It is, however, safe to assume that that tendency will be intensified when projection promises to bring with it the advantage of mental relief. Such an advantage may be expected with certainty where a conflict has arisen between different impulses all of which are striving towards omnipotence – for they clearly cannot *all* become omnipotent. The pathological process in paranoia in fact makes use of the mechanism of projection in order to deal with mental

1 I assume that at this early narcissistic stage cathexes arising from libidinal and from other sources of excitation may still be indistinguishable from one another.

2 Cf. Schreber (1903) and Freud (1911*c* [Section III (4); *RSE*, **12**, 68]).

3 In my paper on Schreber (Freud, 1911*c* [Section III; ibid., **12**, 57 ff.]).

conflicts of this kind. The typical case of such a conflict is one between the two members of a pair of opposites – the case of an ambivalent attitude, which we have examined in detail as it appears in someone mourning the death of a loved relative. [Cf. p. 62 ff. above.] This kind of case must seem particularly likely to provide a motive for the creation of projections. Here again we are in agreement with the writers who maintain that the first-born spirits were *evil* spirits, and who derive the idea of a soul from the impression made by death upon the survivors. The only difference is that *we* do not lay stress on the *intellectual* problem with
[93] which death confronts the living; in our view the force which gives the impetus to research is rather to be attributed to the *emotional* conflict into which the survivors are plunged.

Thus man's first theoretical achievement – the creation of spirits – seems to have arisen from the same source as the first moral restrictions to which he was subjected – the observances of taboo. The fact that they had the same origin need not imply, however, that they arose simultaneously. If the survivors' position in relation to the dead was really what first caused primitive man to reflect, and compelled him to hand over some of his omnipotence to the spirits and to sacrifice some of his freedom of action, then these cultural products would constitute a first acknowledgement of *'Ανάγκη* [Necessity], which opposes human narcissism. Primitive man would thus be submitting to the supremacy of death with the same gesture with which he seemed to be denying it.

If we may venture to exploit our hypothesis still further, we may enquire which essential part of our psychological structure is reflected and reproduced in the projective creation of souls and spirits. It could scarcely be disputed that the primitive conception of a soul, however much it may differ from the later, purely immaterial soul, is nevertheless intrinsically the same; that is to say, it assumes that both persons and things are of a double nature and that their known attributes and modifications are distributed between their two component portions. This original 'duality', to borrow an expression from Herbert Spencer (1893), is identical to the dualism proclaimed by our current distinction between soul and body and by such ineradicable linguistic expressions of it as the use of phrases like 'beside himself' or 'coming to himself' in relation to fits of rage or fainting (ibid., 144).

When we, no less than primitive man, project something into external reality, what is happening must surely be this: we are recognizing the existence of two states – one in which something is directly given to the

senses and to consciousness (that is, is *present* to them), and alongside it another, in which the same thing is *latent* but capable of reappearing. In short, we are recognizing the coexistence of perception and memory, or, putting it more generally, the existence of *unconscious* mental processes [94]
alongside the *conscious* ones.[1] It might be said that in the last analysis the 'spirit' of persons or things comes down to their capacity to be remembered and imagined after perception of them has ceased.

It is not, of course, to be expected that either the primitive or the present-day concept of a 'soul' will be separated from that of the other portion of the personality by the same line of demarcation which our modern science draws between conscious and unconscious mental activity. The animistic soul unites properties from both sides. Its volatile and mobile quality, its power of leaving the body and of taking possession, temporarily or permanently, of another body – these are characteristics which remind us unmistakably of the nature of consciousness. But the way in which it remains concealed behind the manifest personality is reminiscent of the unconscious; immutability and indestructibility are qualities which we no longer attribute to conscious but rather to unconscious processes, and we regard the latter as the true vehicle of mental activity.

I have said [p. 66 above] that animism is a system of thought, the first complete theory of the world, and I shall now go on to draw certain conclusions from the psychoanalytic view of such systems. Every day of our lives our experience is in a position to show us the principal characteristics of a 'system'. We have dreams during the night and we have learnt how to interpret them during the day. Dreams may, without contradicting their nature, appear confused and disconnected. But they may, on the contrary, simulate the orderly impressions of a real experience, they may make one event follow from another and make one portion of their content refer to another. Such a result can be more or less successfully achieved; but it scarcely ever succeeds so completely as to leave no absurdity, no rift in its texture, visible. When we come to submit a dream to interpretation, we find that the erratic and irregular arrangement of its constituent parts is quite unimportant from the point of view of our understanding it. The essential elements in a dream are the dream [95]
thoughts, and these have meaning, connection and order. But their order is quite other than that remembered by us as present in the manifest

1 Cf. my short paper on the use of the concept 'unconscious' in psychoanalysis, first published in the *Proceedings* of the Society for Psychical Research in 1912. [Freud, 1912*g*; *RSE*, **12**, 255 ff.]

dream. In the latter the connection between the dream thoughts has been abandoned and may either remain completely lost or be replaced with the new connection exhibited in the manifest content. The elements of the dream, apart from their being condensed, are almost invariably arranged in a new order more or less independent of their earlier arrangement. Finally, it must be added that whatever the original material of the dream thoughts has been turned into by the dream-work is then subjected to a further influence. This is what is known as 'secondary revision', and its purpose is evidently to get rid of the disconnectedness and unintelligibility produced by the dream-work and replace it with a new 'meaning'. But this new meaning, arrived at by secondary revision, is no longer the meaning of the dream thoughts.[1]

The secondary revision of the product of the dream-work is an admirable example of the nature and pretensions of a system. There is an intellectual function in us which demands unity, connection and intelligibility from any material, whether of perception or thought, that comes within its grasp; and if, as a result of special circumstances, it is unable to establish a true connection, it does not hesitate to fabricate a false one. Systems constructed in this way are known to us not only from dreams, but also from phobias, from obsessive thinking and from delusions. The construction of systems is seen most strikingly in delusional disorders (in paranoia), where it dominates the symptomatic picture; but its occurrence in other forms of neuropsychosis [*Neuropsychosen*] must not be overlooked. In all these cases it can be shown that a *rearrangement* of the psychical material has been made with a fresh aim in view; and the rearrangement may often have to be a drastic one if the outcome is to be made to appear intelligible from the point of view of the system. Thus a system is best characterized by the fact that at least two reasons can be discovered for each of its products: a reason based upon the premises of
[96] the system (a reason, then, which may be delusional) and a concealed reason, which we must judge to be the truly operative and the real one.

This may be illustrated by an example from a neurosis. In my essay on taboo I mentioned a woman patient of mine whose obsessional prohibitions showed the most perfect agreement with a Maori taboo (p. 34 f.). This woman's neurosis was aimed at her husband and culminated in her defence against an unconscious wish that he should die. Her manifest, systematic phobia, however, related to the mention of death in general, while her husband was entirely excluded from it and was never an object

1 [The whole topic of secondary revision is discussed in full in Section I of Chapter VI of *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 437 ff.]

of her conscious solicitude. One day she heard her husband giving instructions that his razors, which had lost their edge, were to be taken to a particular shop to be reset. Driven by a strange uneasiness, she herself set off for the shop. After reconnoitring the ground, she came back and insisted that her husband should get rid of the razors for good and all, since she had discovered that next door to the shop he had named there was an undertaker's establishment: owing to the plan he had made, she said, the razors had become inextricably involved with thoughts of death. This, then, was the *systematic* reason for her prohibition. We may be quite sure that, even without her discovery of the next-door shop, the patient would have come home with a prohibition against the razors. It would have been enough if she had met a hearse on her way to the shop, or someone dressed in mourning or carrying a funeral wreath. The net of possible determinants for the prohibition was spread wide enough to catch the quarry in any event; it merely depended on her decision whether or not to draw it together. It could be shown that on other occasions she would not put the determinants into operation, and she would explain this by saying it had been 'a better day'. The *real* cause of her prohibition upon the razors was, of course, as it was easy to discover, her repugnance to attaching any pleasurable feeling to the idea that her husband might cut his throat with the newly ground razors.

In just the same way, an inhibition upon movement (an abasia or an agoraphobia) will gradually become more complete and more detailed, when once that system has succeeded in installing itself as a representative of an unconscious wish and of the defence against the wish. Whatever other unconscious phantasies and operative reminis- [97]
cences may be present in the patient force their way to expression as symptoms along this same path, once it has been opened, and group themselves into an appropriate new arrangement within the framework of the inhibition upon movement. Thus it would be a vain and indeed a foolish task to attempt to understand the complexities and details of the symptoms of (for example) an agoraphobia on the basis of its underlying premises; for the whole consistency and strictness of the combination are merely *apparent*. Just as with the façades of dreams, if we look more attentively we find the most blatant inconsistency and arbitrariness in the structure of symptoms. The real reason for the details of a systematic phobia of this kind lies in concealed determinants, which need have nothing to do with an inhibition upon movement; and that, too, is why these phobias take such various and contradictory shapes in different people.

Let us now return to the animistic system with which we are dealing. The insight we have gained into *other* psychological systems enables us to conclude that with primitive man, too, 'superstition' need not be the only or the real reason for some particular custom or observance and does not excuse us from the duty of searching for its hidden motives. Under the domination of an animistic system it is inevitable that every observance and every activity shall have a systematic basis, which nowadays we describe as 'superstitious'. 'Superstition' – like 'anxiety', 'dreams' and 'demons' – is one of those provisional psychological concepts which have crumbled under the impact of psychoanalytic research. Once we have penetrated behind these constructions, which are like screens erected as defences against correct understanding, we begin to realize that the mental life and cultural level of savages have not hitherto had all the recognition they deserve.

If we take drive repression as a measure of the level of civilization that has been reached, we shall have to admit that even under the animistic system advances and developments took place which are unjustly despised on account of their superstitious basis. When we are told that the warriors in a savage tribe practise the greatest continence and cleanliness when they go on the war-path, the explanation is put forward
[98] that their motive is 'a fear lest the enemy should obtain the refuse of their persons, and thus be enabled to work their destruction by magic' (Frazer, 1911*b*, 157); and an analogous superstitious reason could be suggested for their continence. Nonetheless, the fact remains that they have made a renunciation of drive; and we can understand the position better if we suppose that the savage warrior submits to these restrictions as a countermeasure because he is on the point of yielding completely to the satisfaction of cruel and hostile impulses which are as a rule prohibited to him. The same is true of the numerous cases of sexual restrictions being imposed on anyone who is engaged on difficult or responsible work (ibid., 200 f.). Though the grounds alleged for these prohibitions may belong to a magical context, yet the fundamental idea of gaining greater strength [*Kraft*][T] by renouncing some drive satisfaction remains unmistakable; and the hygienic root of the prohibition which lies alongside its magical rationalization must not be overlooked. When the men of a savage tribe go out on an expedition to hunt, to fish, to fight or to gather precious plants, their wives left at home are subjected to many oppressive restrictions, to which the savages themselves ascribe a favourable influence, operating at a distance upon the success of the expedition. But it requires very little penetration to see that this factor

which operates at a distance is nothing other than the absent men's longing thoughts of home, and that behind these disguises lies a sound piece of psychological insight that the men will do their best only if they feel completely secure about the women whom they have left behind them unguarded. Sometimes they will even themselves declare, without alleging any magical reasons, that a wife's infidelity in marriage will bring to nothing the efforts of an absent husband engaged on some responsible work.

The countless taboo regulations to which the women in savage communities are subject during menstruation are said to be due to a superstitious horror of blood, and this is no doubt in fact one of their determinants. But it would be wrong to overlook the possibility that in this case the horror of blood also serves aesthetic and hygienic purposes, which are obliged in every case to cloak themselves behind magical motives.

I am under no illusion that in putting forward these attempted [99] explanations I am not laying myself open to the charge of endowing modern savages with a subtlety in their mental activities which exceeds all probability. It seems to me quite possible, however, that the same may be true of our attitude towards the psychology of those races that have remained at the animistic level as is true of our attitude towards the mental life of children, which we adults no longer understand and whose fullness and delicacy of feeling we have in consequence so greatly underestimated.

One further group of taboo observances, which have not hitherto been accounted for, deserve mention, since they admit of an explanation which is familiar to psychoanalysts. Among many savage peoples there is a prohibition against keeping sharp weapons or cutting instruments in a house. Frazer (1911*b*, 238) quotes a German superstition to the effect that a knife should not be left edge upwards, for fear that God and the angels might be injured on it. May we not recognize in this taboo a premonitory warning against possible 'symptomatic acts' in the execution of which a sharp weapon might be employed by unconscious evil impulses?[1]

1 [A discussion of superstition can be found in Section D of Chapter XII of *The Psychopathology of Everyday Life* (1901*b*), *RSE*, **6**, 223 ff., and, in special relation to obsessional neurosis, in the case history of the 'Rat Man' (1909*d*), ibid., **10**, 174 ff.]

IV
THE RETURN OF TOTEMISM IN CHILDHOOD

[100] There are no grounds for fearing that psychoanalysis, which first discovered that psychical acts and structures [*Bildungen*] are invariably overdetermined,[1] will be tempted to trace the origin of anything so complicated as religion to a single source. If psychoanalysis is compelled – and is, indeed, in duty bound – to lay all the emphasis upon one particular source, that does not mean it is claiming either that that source is the only one or that it occupies first place among the numerous contributory factors. Only when we can synthesize the findings in the different fields of research will it become possible to arrive at the relative importance of the part played in the genesis of religion by the mechanism discussed in these pages. Such a task lies beyond the means as well as beyond the purposes of a psychoanalyst.

(1)

In the first of this series of essays we became acquainted with the concept of totemism. We heard that totemism is a system which takes the place of a religion among certain primitive peoples of Australia, America and Africa, and provides the basis of their social organization. As we have heard, it was a Scotsman, McLennan, who in 1869 first drew general attention to the phenomena of totemism (which had hitherto been regarded as mere curiosities) by giving voice to a suspicion that a large number of customs and usages current in various societies ancient and modern were to be explained as remnants of a totemic age. Since that date science has fully accepted his estimate of totemism. Let me quote, as
[101] one of the most recent statements on the subject, a passage from Wundt's *Elemente der Völkerpsychologie* (1912, 139): 'In the light of all these facts, the conclusion appears highly probable that at some time totemic culture everywhere paved the way for a more advanced civilization, and, thus, that it represents a transitional stage between the age of primitive men and the era of heroes and gods.' [English translation, 139.]

The purpose of the present essays obliges us to enter more deeply into the nature of totemism. For reasons which will presently become clear

1 [Cf. *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 509.]

I will begin with an account given by Reinach, who, in 1900,[1] sketched out a '*Code du totémisme*' in twelve Articles – a catechism, as it were, of the totemic religion:

(1) Certain animals may be neither killed nor eaten, but individual members of the species are reared by human beings and cared for by them.

(2) An animal which has died an accidental death is mourned over and buried with the same honours as a member of the clan.

(3) In some instances the eating prohibition extends only to one particular part of the animal's body.

(4) When one of the animals which are usually spared has to be killed under the stress of necessity, apologies are offered to it and an attempt is made by means of various artifices and evasions to mitigate the violation of the taboo – that is to say, the murder.

(5) When the animal is made the victim of a ritual sacrifice, it is solemnly bewailed.

(6) On particular solemn occasions and at religious ceremonies the skins of certain animals are worn. Where totemism is still in force, they are the totem animals.

(7) Clans and individuals adopt the names of animals – viz. of the totem animals.

(8) Many clans make use of representations of animals on their standards and weapons; the men have pictures of animals painted or tattooed on their bodies.

(9) If the totem is a formidable or dangerous animal, it is supposed to spare members of the clan named after it.

(10) The totem animal protects and gives warning to members of its clan. [102]

(11) The totem animal foretells the future to the loyal members of its clan and serves them as guide.

(12) The members of the totemic clan often believe that they are related to the totem animal by the bond of a common ancestry.

This catechism of the totemic religion can only be seen at its proper value if we take into account the fact that Reinach has included in it all the indications and traces from which the earlier existence of a totemic system can be inferred. The author's peculiar attitude to the problem is shown by his partial neglect of the essential features of totemism. As we shall see, he has relegated one of the two principal articles of the totemic catechism to the background and entirely overlooked the other.

1 Cf. Reinach (1905–12, **1**, 17 ff.).

To obtain a correct picture of the nature of totemism we must turn to another author, who has devoted a four-volume work to the subject, which combines the fullest collection of the relevant observations with the most detailed discussion of the problems they raise. We shall remain indebted to J. G. Frazer, the author of *Totemism and Exogamy* (1910), both for enjoyment and instruction, even if psychoanalytic research may lead to conclusions which differ widely from his.[1]

[103] 'A totem', wrote Frazer in his first essay on the subject,[2] 'is a class of material objects which a savage regards with superstitious respect, believing that there exists between him and every member of the class an intimate and altogether special relation. . . . The connection between a man and his totem is mutually beneficent; the totem protects the man, and the man shows his respect for the totem in various ways, by not killing it if it be an animal, and not cutting or gathering it if it be a plant. As distinguished from a fetish, a totem is never an isolated individual, but always a class of objects, generally a species of animals or of plants, more rarely a class of inanimate natural objects, very rarely a class of artificial objects. . . .

'Totems are of at least three kinds: (1) the clan totem, common to a whole clan, and passing by inheritance from generation to generation; (2) the sex totem, common either to all the males or to all the females of a tribe, to the exclusion in either case of the other sex; (3) the individual totem, belonging to a single individual and not passing to his descendants. . . .'

1 It may be as well, however, to warn the reader, in advance, of the difficulties with which any statements on the subject have to contend.

In the first place, those who collect the observations are not the same as those who examine and discuss them. The former are travellers and missionaries while the latter are students who may never have set eyes on the objects of their researches. Again, communication with savages is not an easy matter. The observers are not always acquainted with the native language but may be obliged to rely on the help of interpreters or to conduct their enquiries through the medium of pidgin English. Savages are not communicative on the subject of the most intimate details of their cultural life and they talk openly only to those foreigners who have lived among them for many years. They often give false or misleading information for a great variety of motives. (Cf. Frazer, 1910, **1**, 150 f.) It should not be forgotten that primitive races are not young races but are in fact as old as civilized races. There is no reason to suppose that, for the benefit of our information, they have retained their original ideas and institutions undeveloped and undistorted. On the contrary, it is certain that there have been profound changes in every direction among primitive races, so that it is never possible to decide without hesitation how far their present-day conditions and opinions preserve the primaeval past in a petrified form and how far they are distortions and modifications of it. Hence arise the all-too-frequent disputes among the authorities as to which characteristics of a primitive civilization are to be regarded as primary and as to which are later and secondary developments. The determination of the original state of things thus invariably remains a matter of construction. Finally, it is not easy to feel one's way into [*einzufühlen*] primitive modes of thinking. We misunderstand primitive men just as easily as we do children, and we are always apt to interpret their actions and feelings according to our own mental constellations.

2 *Totemism*, Edinburgh, 1887, reprinted in Frazer (1910, **1**, 3 ff.).

The last two kinds of totem do not compare in significance with the clan totem. Unless we are quite mistaken, they are late developments and of little importance for the essential nature of the totem.

'The clan totem is reverenced by a body of men and women who call themselves by the name of the totem, believe themselves to be of one blood, descendants of a common ancestor, and are bound together by common obligations to each other and by a common faith in the totem. Totemism is thus both a religious and a social system. In its religious [104] aspect it consists of the relations of mutual respect and protection between a man and his totem; in its social aspect it consists of the relations of the clansmen to each other and to men of other clans. In the later history of totemism these two sides, the religious and the social, tend to part company; the social system sometimes survives the religious; and, on the other hand, religion sometimes bears traces of totemism in countries where the social system based on totemism has disappeared. How in the origin of totemism these two sides were related to each other it is, in our ignorance of that origin, impossible to say with certainty. But on the whole the evidence points strongly to the conclusion that the two sides were originally inseparable; that, in other words, the farther we go back, the more we should find that the clansman regards himself and his totem as beings of the same species, and the less he distinguishes between conduct towards his totem and towards his fellow-clansmen.'

In giving particulars of totemism as a religious system, Frazer begins by stating that the members of a totem clan call themselves by the name of their totem, and *commonly believe themselves to be actually descended from it*. It follows from this belief that they will not hunt the totem animal or kill or eat it and, if it is something other than an animal, they refrain from making use of it in other ways. The rules against killing or eating the totem are not the only taboos; sometimes they are forbidden to touch it, or even to look at it; in a number of cases the totem may not be spoken of by its proper name. Any violation of the taboos that protect the totem are automatically punished by severe illness or death.[1]

Specimens of the totem animal are occasionally reared by the clan and cared for in captivity.[2] A totem animal that is found dead is mourned for and buried like a dead clansman. If it is necessary to kill a totem animal, this is done according to a prescribed ritual of apologies and ceremonies of expiation.

1 Cf. my earlier essay on taboo [above, p. 27 f.].

2 As is done to this day with the she-wolf in her cage beside the steps leading up to the Capitol in Rome and with the bears in their den at Bern.

[105] The clan expects to receive protection and care from its totem. If it is a dangerous animal (such as a beast of prey or a venomous snake) there is a presumption that it will do no harm to its clansmen; and if that expectation is not fulfilled the injured man is expelled from the clan. Oaths, in Frazer's opinion, were originally ordeals; thus, many tests of descent and legitimacy were submitted for decision to the totem. The totem gives help in sickness and delivers omens and warnings to its clan. The appearance of the totem in or about a house is often regarded as an omen of death; the totem has come to fetch his kinsman.[1]

In particular important circumstances the clansman seeks to emphasize his kinship with the totem by making himself resemble it externally, by dressing in the skin of the animal, by incising a picture of the totem upon his own body, and so on. This identification with the totem is carried into effect in actions and words on the ceremonial occasions of birth, initiation and burial. Various magical and religious purposes are served by dances in which all the clansmen disguise themselves as their totem and imitate its behaviour. Lastly, there are ceremonies in which the totem animal is ceremoniously killed.[2]

The social aspect of totemism is principally expressed in a severely enforced injunction and a sweeping restriction.

The members of a totem clan are brothers and sisters and are bound to help and protect one another. If a member of a clan is killed by someone outside it, the whole clan of the aggressor is responsible for the deed and the whole clan of the murdered man is at one in demanding satisfaction for the blood that has been shed. The totem bond is stronger than that of the family in our sense. The two do not coincide, since the totem is as a rule inherited [*Übertragung*] through the female line, and it is possible that paternal descent may originally have been left entirely out of account.

The corresponding taboo restriction prohibits members of the same totem clan from marrying or having sexual intercourse with each other. Here we have the notorious and mysterious correlate of totemism – *exogamy*. I have devoted the whole of the first essay in the present work [106] to that subject, so that here I need only repeat that it originates from the intensification among savages of the horror of incest, that it would be fully explained as an assurance against incest under conditions of group marriage, and that it is primarily aimed at restraining the *younger* generation from incest and that only as a later development does it interfere with the older generation. [See above, p. 14 and footnote.]

1 Like the White Lady in certain aristocratic families.

2 Frazer (1910, **1**, 45). See my discussion of sacrifice below [p. 123 ff.].

To Frazer's account of totemism – one of the earliest in the literature of the subject – I will add a few extracts from one of the most recent ones. In his *Elemente der Völkerpsychologie*, Wundt (1912, 116 ff.) writes as follows: 'The totem animal is also usually regarded as the ancestral animal of the group in question. "Totem" is, on the one hand, a group name, and, on the other, a name indicative of ancestry. In the latter connection it has also a mythological significance. These various ideas, however, interplay in numerous ways. Some of the meanings may recede, so that totems have frequently become a mere nomenclature of tribal divisions, while at other times the idea of ancestry, or, perhaps also, the cult significance, predominates. . . .' The concept of the totem has a decisive influence upon tribal division and tribal organization, which are subject to certain norms of custom. 'These norms, and their fixed place in the beliefs and feelings of the tribal members, are connected with the fact that originally, at all events, the totem animal was regarded, for the most part, as having not merely given its name to a group of tribal members but as having actually been its forefather. . . . Bound up with this is the further fact that these animal ancestors possessed a cult. . . . Aside from specific ceremonies and ceremonial festivals, this animal cult originally found expression primarily in the relations maintained towards the totem animal. It was not merely a particular animal that was to a certain extent held sacred, but every representative of the species. The totem members were forbidden to eat the flesh of the totem animal, or were allowed to do so only under specific conditions. A significant counter-phenomenon, not irreconcilable with this, is the fact that on certain occasions the eating of the totem flesh constituted a sort of ceremony. . . .'

'. . . The most important social aspect of this totemic tribal organization, however, consists in the fact that it involved certain norms of custom regulating the intercourse of the separate groups with one another. Of these norms, those governing marriage relations were of first importance. The tribal organization of this period was bound up with an important institution, *exogamy*, which originated in the totemic age.' [English translation, 116 f.] [107]

If we seek to penetrate to the original nature of totemism, without regard to subsequent accretions or attenuations, we find that its essential characteristics are these: *Originally, all totems were animals, and were regarded as the ancestors of the different clans. Totems were inherited only through the female line. There was a prohibition against killing the*

totem (or – which, under primitive conditions, is the same thing – *against eating it*). *Members of a totem clan were forbidden to practise sexual intercourse with one another.*[1]

We shall now, perhaps, be struck by the fact that in Reinach's *Code du totémisme* one of the two principal taboos, that of exogamy, is not mentioned at all, while the belief upon which the second one is founded, namely descent from the totem animal, is referred to only in passing. My reason, however, for selecting the account given by Reinach (a writer, incidentally, who has made very valuable contributions to the subject) [108] was to prepare us for the differences of opinion between the authorities – differences into which we must now enter.

(2)

The more incontestable became the conclusion that totemism constitutes a regular phase in all cultures, the more urgent became the need for arriving at an understanding of it and for throwing light upon the puzzle of its essential nature. Everything connected with totemism seems to be puzzling: the decisive problems concern the origin of the idea of descent from the totem and the reasons for exogamy (or rather for the taboo upon incest of which exogamy is the expression), as well as the relation between these two institutions, totemic organization and prohibition of incest. Any satisfactory explanation should be at once a historical and a psychological one. It should tell us under what conditions this peculiar institution developed and to what psychical needs in men it has given expression.

My readers will, I am sure, be astonished to hear of the variety of angles from which attempts have been made to answer these questions, and of the wide divergences of opinion upon them put forward by the experts. Almost any generalization that could be made on the subject of totemism and exogamy seems open to question. Even the account that I have just given, derived from the book published by Frazer in 1887, is

1 The picture of totemism given by Frazer in his second work on it ('The Origin of Totemism', published in the *Fortnightly Review* in 1899) agrees with what I have written above: 'Thus, Totemism has commonly been treated as a primitive system both of religion and of society. As a system of religion it embraces the mystic union of the savage with his totem; as a system of society it comprises the relations in which men and women of the same totem stand to each other and to the members of other totemic groups. And corresponding to these two sides of the system are two rough and ready tests or canons of Totemism: first, the rule that a man may not kill or eat his totem animal or plant; and second, the rule that he may not marry or cohabit with a woman of the same totem.' [Reprinted in Frazer, 1910, **1**, 101.] Frazer then proceeds (thus plunging us into the middle of the controversies on totemism): 'Whether the two sides – the religious and the social – have always coexisted or are essentially independent, is a question which has been variously answered.'

open to the criticism that it expresses the present writer's arbitrary preferences; and indeed it would be contested today by Frazer himself, who has repeatedly changed his opinions on the subject.[1]

It is plausible to suppose that an understanding of the essential nature of totemism and exogamy would best be arrived at, if it were possible to come nearer to the origins of the two institutions. But in this connection we must bear in mind Andrew Lang's warning that even primitive [109] peoples have not retained the original forms of those institutions nor the conditions which gave rise to them; so that we have nothing whatever but hypotheses to fall back upon as a substitute for the observations which we are without.[2] Some of the attempted explanations seem, in the judgement of a psychologist, inadequate at the very outset: they are too rational and take no account of the emotional character of the matters to be explained. Others are based on assumptions which are unconfirmed by observation. Yet others rely upon material which would be better interpreted in another way. There is generally little difficulty in refuting the various views put forward: the authorities are as usual more effective in their criticisms of one another's work than in their own productions. The conclusion upon most of the points raised must be a *non liquet*. It is not surprising, therefore, that in the most recent literature on the subject (which is for the most part passed over in the present work) an unmistakable tendency emerges to reject any general solution to totemic problems as impracticable. (See, for instance, Goldenweiser, 1910.) In the discussion of these conflicting hypotheses which follows, I have ventured to disregard their chronological sequence.

(*a*) *The Origin of Totemism*

The question of the origin of totemism may be put in another way: how did it come about that primitive men called themselves (and their clans) after animals, plants and inanimate objects?[3]

McLennan (1865 and 1869–70), the Scot who discovered totemism and exogamy for the world of science, refrained from publishing any opinion

1 He makes the following admirable comment upon such changes of opinion: 'That my conclusions on these difficult questions are final, I am not so foolish as to pretend. I have changed my views repeatedly, and I am resolved to change them again with every change of the evidence, for like a chameleon the candid inquirer should shift his colours with the shifting colours of the ground he treads.' (Frazer, 1910, **1**, [xiii].)

2 'By the nature of the case, as the origin of totemism lies far beyond our powers of historical examination or of experiment, we must have recourse as regards this matter to conjecture.' (Lang, 1905, 27.) 'Nowhere do we see absolutely *primitive* man, and a totemic system in the making.' (Ibid., 29.)

3 In the first instance probably after animals only.

on the origin of totemism. According to Andrew Lang (1905, 34) he was at one time inclined to think that it originated from the custom of tattooing. I propose to divide the published theories on the origin of totemism [110] into three groups – (α) the nominalist, (β) the sociological and (γ) the psychological.

(α) *Nominalist Theories*

My accounts of these theories will justify my having brought them together under the title I have adopted.

Garcilaso de la Vega, a descendant of the Peruvian Incas, who wrote a history of his people in the seventeenth century, seems already to have attributed the origin of what he knew of totemic phenomena to the need felt by clans to distinguish themselves from one another by the use of names. (Lang, 1905, 34.) Hundreds of years later the same idea was again proposed. Keane [1899, 396][1] regards totems as 'heraldic badges' by means of which individuals, families and clans sought to distinguish themselves from one another. The same idea is expressed once more by Max-Müller (1897, [**I**, 201]):[2] 'A totem is a clan mark, then a clan name, then the name of the ancestor of a clan, and lastly the name of something worshipped by a clan.' Julius Pikler,[3] writing later, declares: 'Mankind required both for communities and for individuals a permanent name which could be fixed in writing. . . . Thus totemism did not arise from the religious needs of men but from their practical, everyday needs. The core of totemism, nomenclature, is a result of the primitive technique of writing. In its nature a totem is like an easily drawn pictograph. But when once savages bore the name of an animal, they went on to form the idea of kinship with it.'

In the same way, Herbert Spencer (1870 and 1893, 331–46) regards the giving of names as the decisive factor in the origin of totemism. The personal characteristics of particular individuals, he argues, prompted the idea of calling them after animals, and in that way they acquired [111] laudatory names or nicknames which were handed on to their descendants. As a result of the vagueness and unintelligibility of primitive speech, later generations interpreted these names as evidence of descent from the actual animals. Totemism would thus be shown to be a misunderstood form of ancestor worship.

1 Quoted by Lang [1903, ix f.].

2 Quoted by Lang [1905, 118].

3 Pikler & Somló [1900]. These authors justly describe their attempted explanation of the origin of totemism as 'a contribution to the materialist theory of history'.

Lord Avebury (better known under his earlier name of Sir John Lubbock) gives a very similar account of the origin of totemism, though without insisting upon the element of misunderstanding. If, he says, we wish to explain animal worship, we must not forget how often human names are borrowed from animals. The children and followers of a man who was called 'Bear' or 'Lion' naturally turned his name into a clan name. Thence it came about that the animal itself would come to be regarded 'first with interest, then with respect and at length with a sort of awe'. [Lubbock, 1870, 171.]

What would seem to be an incontrovertible objection to this derivation of totem names from the names of individuals was brought forward by Fison.[1] He showed from conditions in Australia that the totem is invariably 'the badge of a group, not of an individual'. But even if this were not so, and the totem was originally the name of an individual, it could never – since totems are inherited through the female line – be transmitted to his children.

Moreover, the theories which I have so far discussed are obviously inadequate. They might perhaps explain the fact that primitive peoples adopt animal names for their clans, but they could never explain the importance that has become attached to this nomenclature – namely, the totemic system. The theory belonging to this group which most deserves attention is that proposed by Andrew Lang (1903 and 1905). He, too, regards the giving of names as the heart of the problem, but he introduces two interesting psychological factors and may thus claim to have led the way towards the final solution to the enigma of totemism.

Andrew Lang regards it as initially a matter of indifference how clans obtained their animal names. It is only necessary to assume that they awoke one day to the consciousness that they bore such names and could give no account of how this had come about. *The origin of the names had* [112]
been forgotten. They would then attempt to arrive at an explanation by speculating on the subject; and, in view of their belief in the importance of names, they were bound to reach all the ideas contained in the totemic system. Primitive races (as well as modern savages and even our own children[2]) do not, like us, regard names as something indifferent and conventional, but as significant and essential. A man's name is a principal component of his personality, perhaps even a portion of his soul. The fact of a primitive man bearing the same name as an animal must lead him to assume the existence of a mysterious and significant bond between

1 Fison & Howitt (1880, 165), quoted by Lang (1905, [141]).

2 See the discussion of taboo above, p. 57 ff.

himself and that particular species of animal. What other bond could it be than one of blood relationship? Once the similarity of names had led to this conclusion, the blood taboo would immediately involve all the totemic ordinances, including exogamy. 'No more than these three things – a group animal name of unknown origin; belief in a transcendental connection between all bearers, human and bestial, of the same name; and belief in the blood superstitions – was needed to give rise to all the totemic creeds and practices, including exogamy.' (Lang, 1905, 125 f.)

Lang's explanation falls into two parts. One part of it traces the totemic system as a matter of psychological necessity from the fact of the totems having animal names – always presupposing that the origin of these names had been forgotten. The second part of his theory goes on to try to explain how the names in fact originated; as we shall see, it is of a very different character from the first part.

This second part of Lang's theory differs in no essential way from the other theories which I have called 'nominalist'. The practical necessity for differentiation compelled the various clans to adopt names, and they therefore acquiesced in the names by which each clan was called by another clan. This 'naming from without' is the special feature of Lang's construction. The fact that the names adopted in this way were borrowed from animals needs no special comment and there is no reason why they should have been regarded in primitive times as insulting or derisive. Moreover, Lang has adduced not a few
[113] instances from later historical times in which names that were originally given in derision by outsiders have been accepted and willingly adopted (e.g. '*Les Gueux*',[1] 'Whigs' and 'Tories'). The hypothesis that in the course of time the origin of these names was forgotten connects this part of Lang's theory with the other part which I have already discussed.

(*β*) *Sociological Theories*

Reinach, who has been successful in tracing survivals of the totemic system in the cults and usages of later periods but who has always attached small importance to the factor of descent from the totem, remarks confidently in one passage that in his opinion totemism is nothing more than '*une hypertrophie de l'instinct social*'. (Reinach, 1905–12, **1**, 41.) A similar view seems to run through the recent book by Durkheim (1912). The totem, he argues, is the visible representative [*Repräsentant*] of social

1 ['The Rascals': the Dutch rebels in the sixteenth century.]

religion among the races concerned: it embodies the community, which is the true object of their worship.

Other writers have sought to find a more precise basis for the participation of the social drives in the formation of totemic institutions. Thus Haddon (1902, [745])[1] supposes that each primitive clan originally subsisted upon some one species of animal or plant and perhaps traded in that particular article of food and exchanged it with other clans. It would inevitably follow that this clan would be known to the others by the name of the animal which was of such importance to it. At the same time the clan would be bound to become especially familiar with the animal and develop a peculiar interest in it, though this would be founded on no psychical motive other than the most elementary and urgent of human needs, that is, on hunger.

Against this most 'rational' of all the theories of totemism it has been objected that feeding conditions of this kind are never found among primitive races and have probably never existed. Savages are omnivorous, and the more so the lower their condition. Nor is it easy to see how an exclusive diet such as this could have developed into an almost religious attitude to the totem, culminating in absolute abstention from [114]
the favourite food. [Cf. Frazer, 1910, **4**, 51.]

The first of the three theories on the origin of totemism which Frazer himself has supported at different times was a psychological one, and I shall deal with it later. His second theory, with which we are here concerned, took form under the influence of a momentous publication by two men who had made researches among the natives of Central Australia.

Spencer & Gillen (1899) described a number of peculiar observances, usages and beliefs found in a group of tribes known as the Arunta nation; and Frazer agreed with their opinion that these peculiarities were to be regarded as features of a primitive condition of things and might throw light upon the original and true meaning of totemism.

The peculiarities found in the Arunta tribe (a portion of the Arunta nation) are as follows:

(1) The Arunta are divided into totem clans, but the totem is not hereditary but determined for each individual in a manner to be described presently.

(2) The totem clans are not exogamous; but the restrictions upon marriage are based upon a highly developed division into marriage classes, which have no connection with the totem.

(3) The function of the totem clans lies in their performing a ceremony which has as its aim the multiplication of the edible totem object by a

1 Quoted by Frazer (1910, **4**, 50).

characteristically magical method. (This ceremony is known as *intichiuma*.)

(4) The Arunta have a peculiar theory of conception and reincarnation. They believe that there are places scattered over the country ['totem centres'] at each of which the spirits of the dead of some one totem await reincarnation and enter the body of any woman who passes by the spot. When a child is born, the mother reports at which of these places she thinks it was conceived, and the child's totem is determined accordingly. It is further believed that the spirits (both of the dead and of the reborn) are intimately associated with certain peculiar stone amulets, known as *churinga*, which are found at these same centres.

Two factors seem to have led Frazer to suppose that the observances
[115] among the Arunta constitute the oldest form of totemism. First, there was the existence of certain myths which declared that the ancestors of the Arunta regularly ate their totem and always married women of their own totem. Secondly, there was the apparent disregard of the sexual act in their theory of conception. People who had not yet discovered that conception is the result of sexual intercourse might surely be regarded as the most backward and primitive of living men.

By focusing his judgement of totemism upon the *intichiuma* ceremony, Frazer came all at once to see the totemic system in an entirely new light: as a purely practical organization for meeting the most natural of human needs. (Cf. Haddon's theory above [p. 107].)[1] The system was simply an example upon a large scale of 'cooperative magic'. Primitive men set up what might be described as a magical producers' and consumers' union. Each totem clan undertook the business of guaranteeing the plentiful supply of one particular article of food. Where non-edible totems were concerned (such as dangerous animals, or rain, wind, etc.) the duty of the totem clan lay in controlling the natural force in question and in counteracting its injurious possibilities. The achievements of each clan were to the advantage of all the rest. Since each clan might eat none, or only very little, of its own totem, it provided that valuable material for the other clans and was itself provided in exchange with what *they* produced as their social totemic duty. In the light of the insight which he thus obtained from the *intichiuma* ceremony, Frazer came to believe that the prohibition against eating one's own totem had blinded people to the more important element in the situation, namely the injunction to produce as much as possible of an edible totem to meet the needs of other people.

1 'There is nothing vague or mystical about it, nothing of that metaphysical haze which some writers love to conjure up over the humble beginnings of human speculation, but which is utterly foreign to the simple, sensuous and concrete modes of thought of the savage.' (Frazer, 1910, **1**, 117.)

Frazer accepted the Arunta tradition that each totem clan had originally eaten its own totem without restriction. But it was then difficult to understand the next stage in development, at which the clansmen became content with assuring a supply of the totem for others, while [116] themselves renouncing its enjoyment almost completely. He supposed that this restriction had arisen, not from any kind of religious deference, but perhaps from observing that animals never fed upon their own kind: to do so might imply a breach in their identification with their totem and consequently reduce their power of controlling it. Or it might be that by sparing the creatures they hoped to conciliate them. Frazer, however, makes no disguise of the difficulties involved in these explanations (1910, **1**, 121 ff.); nor does he venture to suggest by what means the custom described in the Arunta myths of marrying within the totem was transformed into exogamy.

The theory based by Frazer on the *intichiuma* ceremony stands or falls with the assertion of the primitive character of the Arunta institutions. But in face of the objections raised by Durkheim[1] and Lang (1903 and 1905), that assertion appears untenable. On the contrary, the Arunta seem to be the most highly developed of the Australian tribes and to represent a stage of totemism in dissolution rather than its beginnings. The myths which impressed Frazer so deeply because, in contrast to the conditions that rule today, they lay stress upon liberty to eat the totem and to marry within the totem – these myths are easily explicable as wishful phantasies which, like the myth of a Golden Age, have been projected back into the past.

(γ) *Psychological Theories*

Frazer's first psychological theory, formed before he became acquainted with Spencer & Gillen's observations, was based on the belief in an 'external soul'.[2] The totem, according to this view, represented a safe place of refuge in which the soul could be deposited and so escape the dangers which threatened it. When a primitive man had deposited his soul in his totem he himself was invulnerable, and he naturally avoided doing any injury to the receptacle of his soul. Since, however, he did not know in [117] which particular individual of the animal species concerned his own soul was lodged, it was reasonable for him to spare the whole species.

Frazer himself subsequently abandoned this theory that totemism was derived from a belief in souls; and, after coming to know of Spencer & Gillen's observations, adopted the sociological theory which I have

1 In *L'année sociologique* (1898, 1902, 1905, etc.); see especially 'Sur le totémisme' (1902, [89 f.]).

2 See Frazer, *The Golden Bough*, First Edition (1890), **2**, 332 ff. [Cf. also Frazer, 1910, **4**, 52 ff.]

already discussed. But he came to see himself that the motive from which that second theory derived totemism was too 'rational' and that it implied a social organization which was too complicated to be described as primitive.[1] The magical cooperative societies now seemed to him to be the fruit rather than the seed of totemism. He sought some simpler factor, some primitive superstition behind these structures, to which the origin of totemism might be traced back. At last he found this original factor in the Arunta's remarkable story of conception.

The Arunta, as I have already explained, eliminate the connection between the sexual act and conception. At the moment at which a woman feels she is a mother, a spirit, which has been awaiting reincarnation in the nearest totem centre where the spirits of the dead collect, has entered her body. She will bear this spirit as a child, and the child will have the same totem as all the spirits waiting at that particular centre. This theory of conception cannot explain totemism, since it presupposes the existence of totems. But let us go back a step further and suppose that originally the woman believed that the animal, plant, stone or other object, with which her imagination was occupied at the moment when she first felt she was a mother, actually made its way into her and was later born in human form. In that case the identity between a man and his totem would have a factual basis in his mother's belief and all the remaining totem ordinances (with the exception of exogamy) would follow. A man would refuse to eat this animal or plant because to do so would amount to eating himself. He would, however, have a reason for occasionally partaking of his totem in
[118] a ceremonial manner, because in that way he might strengthen his identification with the totem, which is the essence of totemism. Some observations made by Rivers [1909, 173 f.] upon the natives of the Banks' Islands[2] seemed to prove a direct identification of human beings with their totem on the basis of a similar theory of conception.

Accordingly, the ultimate source of totemism would be the savages' ignorance of the process by which men and animals reproduce their kind; and, in particular, ignorance of the part played by the male in fertilization. This ignorance must have been facilitated by the long interval between the act of fertilization and the birth of the child (or the first perception of its movements). Thus totemism would be a creation of the feminine rather than of the masculine mind: its roots would lie in 'the sick fancies of pregnant women'. 'Anything indeed that struck a woman

1 'It is unlikely that a community of savages should deliberately parcel out the realm of nature into provinces, assign each province to a particular band of magicians, and bid all the bands to work their magic and weave their spells for the common good.' (Frazer, 1910, **4**, 57.)

2 Quoted by Frazer (1910, **2**, 89 ff. and **4**, 59).

at that mysterious moment of her life when she first knows herself to be a mother might easily be identified by her with the child in her womb. Such maternal fancies, so natural and seemingly so universal, appear to be the root of totemism.' (Frazer, 1910, **4**, 63.)

The main objection to this third of Frazer's theories is the same as has already been brought against the second or sociological one. The Arunta seem to be far removed from the beginnings of totemism. Their denial of paternity does not appear to rest upon primitive ignorance; in some respects they themselves make use of descent through the father. They seem to have sacrificed paternity for the sake of some sort of speculation designed to honour the souls of their ancestors.[1] They have enlarged the myth of the impregnation of a virgin by the spirit into a general theory of conception; but that is no reason why ignorance of the conditions governing fertilization should be imputed to them any more than to the peoples of antiquity at the time of the origin of the Christian myths.

Another psychological theory of the origin of totemism has been advanced by a Dutchman, G. A. Wilken [1884, 997]. It connects totemism with the belief in the transmigration of souls. 'The animal in which the souls of the dead are thought by preference to be incarnate becomes a [119] kinsman, an ancestor, and as such is revered.'[2] It seems more likely, however, that the belief in transmigration was derived from totemism than *vice versa*.

Yet another theory of totemism is held by some eminent American ethnologists, Franz Boas, C. Hill-Tout, and others. It is based upon observations on North American Indian totemic clans and maintains that the totem was originally the guardian spirit of an ancestor, who acquired it in a dream and transmitted it to his descendants. We have already heard the difficulties which stand in the way of the view that totems are inherited from single individuals [cf. p. 105 above]; but apart from this, the Australian evidence lends no support to the theory that totems are derived from guardian spirits. (Frazer, 1910, **4**, 48 ff.)

The last of the psychological theories, that put forward by Wundt (1912, 190), is based upon two facts. 'In the first place, the original totem, and the one which continues to remain most common, is the animal; and, secondly, the earliest totem animals are identical with soul animals.' [English translation, 192.] Soul animals (such as birds, snakes, lizards and mice) are appropriate receptacles of souls which have left the body, on account of their rapid movements or flight through the air or of other

1 'That belief is a philosophy far from primitive.' (Lang, 1905, 192.)

2 Quoted by Frazer (1910, **4**, 45 f.).

qualities likely to produce surprise or alarm. Totem animals are derived from the transformations of the 'breath soul' into animals. Thus, according to Wundt, totemism is directly connected with the belief in spirits, that is to say with animism.

(*b*) *and* (*c*) *The Origin of Exogamy and its Relation to Totemism*

I have set out the different theories about totemism in some detail, though even so compression has been inevitable and I fear that my account may have suffered in consequence. In what follows, however, I shall venture, for my readers' sake, to be still more condensed. The discussions on the exogamy practised by totemic peoples are, owing to the nature of the material with which they deal, particularly complicated and diffuse – one might even say confused. The purposes of the present work make it possible for me to limit myself to tracing certain of the
[120] main lines of dispute, while referring those who wish to enter into the subject more deeply to the specialized writings from which I have so frequently quoted.

The attitude taken by an author on the problems of exogamy must naturally depend to some extent on the position he has adopted towards the various theories of totemism. Some of the explanations of totemism exclude any connection with exogamy, so that the two institutions fall completely apart. Thus we find two opposing views: one which seeks to maintain the original presumption that exogamy forms an inherent part of the totemic system, and the other which denies that there is any such connection and holds that the convergence between these two features of the oldest cultures is a chance one. This latter opinion has been adopted without qualification by Frazer in his later works: 'I must request the reader to bear constantly in mind', he writes, 'that the two institutions of totemism and exogamy are fundamentally distinct in origin and nature, though they have accidentally crossed and blended in many tribes.' (Frazer, 1910, **1**, xii.) He gives an explicit warning that the opposite view must be a source of endless difficulties and misunderstandings.

Other writers have, on the contrary, found a means of regarding exogamy as an inevitable consequence of the basic principles of totemism. Durkheim (1898, 1902 and 1905) has put forward the view that the taboo attached to totems was bound to involve prohibition against practising sexual intercourse with a woman of the same totem. The

totem is of the same blood as the man and consequently the ban upon shedding blood (in connection with defloration and menstruation) prohibits him from sexual relations with a woman belonging to his totem.[1] Andrew Lang (1905, 125), who agrees with Durkheim on this subject, believes that the prohibition against women of the same clan might operate even without any blood taboo. The general totem taboo (which, for instance, forbids a man to sit under his own totem tree) would, in Lang's opinion, have been sufficient. Incidentally, he complicates this with another explanation of exogamy (see below [p. 117 f.]) and omits to show how the two explanations are related to each other.

As regards the chronological relations between the two institutions, [121]
most of the authorities agree that totemism is the older of them and that exogamy arose later.[2]

Of the theories which seek to show that exogamy is independent of totemism, I shall only draw attention to a few which throw light on the attitude of the different authors to the problem of incest.

McLennan (1865) ingeniously inferred the existence of exogamy from the vestiges of customs which seemed to indicate the earlier practice of marriage by capture. He formed a hypothesis that in the earliest times it had been a general usage for men to obtain their wives from another group and that marriage with a woman of their own group gradually 'came to be considered improper because it was unusual' [ibid., 289]. He accounted for the prevalence of exogamy by supposing that the practice of killing the majority of female children at birth had led to a scarcity of women in primitive societies. We are not here concerned with the question of how far these assumptions of McLennan's are supported by the actual findings. What interests us far more is the fact that his hypotheses fail to explain why the male members of a group should refuse themselves access to the few remaining women of their own blood – the fact that he entirely overlooks the problem of incest. (Frazer, 1910, **4**, 71–92.)

Other students of exogamy, on the contrary, and evidently with greater justice, have seen in exogamy an institution for the prevention of incest.[3] When one considers the gradually increasing complication of the Australian restrictions upon marriage, it is impossible not to accept the opinions

1 See the criticisms of Durkheim's views by Frazer (1910, **4**, 100 ff.).

2 See, for instance, Frazer (1910, **4**, 75): 'The totemic clan is a totally different social organism from the exogamous clan, and we have good grounds for thinking that it is far older.'

3 Cf. the first essay in this work.

of Morgan (1877), Frazer (1910, **4**, 105 ff.), Howitt [1904, 143] and Baldwin Spencer that those regulations bear (in Frazer's words) 'the impress of deliberate design' and that they aimed at achieving the result they have in fact achieved. 'In no other way does it seem possible to explain in all its details a system at once so complex and so regular.' (Frazer, ibid., 106.)

[122] It is interesting to observe that the first restrictions produced by the introduction of marriage classes affected the sexual freedom of the *younger* generation (that is, incest between brothers and sisters and between sons and mothers) whereas incest between fathers and daughters was prevented only by a further extension of the regulations.

But the fact that exogamous sexual restrictions were imposed intentionally throws no light on the motive which led to their imposition. What is the ultimate source of the horror of incest which must be recognized as the root of exogamy? To explain it by the existence of an instinctive [*instinktive*] dislike of sexual intercourse with blood relatives – that is to say, by an appeal to the fact that there *is* a horror of incest – is clearly unsatisfactory; for social experience shows that, in spite of this supposed instinct [*Instinkt*], incest is no uncommon event even in our present-day society, and history tells us of cases in which incestuous marriage between privileged persons was actually the rule.

Westermarck (1906–8, **2**, 368)[1] has explained the horror of incest on the ground that 'there is an innate aversion to sexual intercourse between persons living very closely together from early youth, and that, as such persons are in most cases related by blood, this feeling would naturally display itself in custom and law as a horror of intercourse between near kin'. Havelock Ellis [1914, 205 f.], though he disputed the driven [*triebhaften*] character of the aversion, subscribed to this explanation in the main: 'The normal failure of the pairing instinct [*Paarungstriebes*][2] to manifest itself in the case of brothers and sisters, or of boys and girls brought up together from infancy, is a merely negative phenomenon due to the inevitable absence in those circumstances of the conditions which evoke the pairing instinct. . . . Between those who have been brought up together from childhood all the sensory stimuli of vision, hearing and touch have been dulled by use, trained to the calm level of affection, and deprived of their potency [*Macht*] to arouse the erethistic excitement [*Erregung*] which produces sexual tumescence.'

It seems to me very remarkable that Westermarck should consider that this innate aversion to sexual intercourse with those with whom one has

[123] been intimate in childhood is also the equivalent [*Repräsentanz*] in

1 In the same chapter he replies to various objections which have been raised against his views.

2 [Translated thus by Freud.]

psychical terms of the biological fact that inbreeding is detrimental to the species. A biological instinct [*Instinkt*] of the kind suggested would scarcely have gone so far astray in its psychological expression that, instead of applying to blood relatives (intercourse with whom might be injurious to reproduction), it affected persons who were totally innocuous in this respect, merely because they shared a common home. I cannot resist referring, too, to Frazer's admirable criticism of Westermarck's theory. Frazer finds it inexplicable that today there should be scarcely any sexual aversion to intercourse with house-mates, whereas the horror of incest, which on Westermarck's theory is only a derivative of that aversion, should have increased so enormously. But some further comments of Frazer's go deeper, and these I shall reproduce in full, since they are in essential agreement with the arguments which I put forward in my essay on taboo:

'It is not easy to see why any deep human instinct [*Instinkt*][1] should need to be reinforced by law. There is no law commanding men to eat and drink or forbidding them to put their hands in the fire. Men eat and drink and keep their hands out of the fire instinctively [*instinktgemäss*] for fear of natural not legal penalties, which would be entailed by violence done to these instincts [*Triebe*][1]. The law only forbids men to do what their instincts [*Triebe*][1] incline them to do; what nature itself prohibits and punishes, it would be superfluous for the law to prohibit and punish. Accordingly we may always safely assume that crimes forbidden by law are crimes which many men have a natural propensity to commit. If there was no such propensity there would be no such crimes, and if no such crimes were committed what need to forbid them? Instead of assuming, therefore, from the legal prohibition of incest that there is a natural aversion to incest, we ought rather to assume that there is a natural instinct [*Instinkt*][1] in favour of it, and that if the law represses [*unterdrückt*][1] it, as it represses other natural instincts [*Trieb*][1], it does so because civilized men have come to the conclusion that the satisfaction of these natural instincts [*Triebe*][1] is detrimental to the general interests of society.' (Frazer, 1910, **4**, 97 f.)

I may add to these excellent arguments of Frazer's that the findings of psychoanalysis make the hypothesis of an innate aversion to incestuous intercourse totally untenable. They have shown, on the contrary, that the [124]
earliest sexual excitations of youthful human beings are invariably of an incestuous character and that such impulses when repressed play a part that can scarcely be overestimated as driving forces of neuroses in later life.

1 [Translated thus by Freud.]

Thus the view which explains the horror of incest as an innate instinct [*Instinkts*] must be abandoned. Nor can anything more favourable be said of another, widely held explanation of the law against incest, according to which primitive peoples noticed at an early date the dangers with which their race was threatened by inbreeding and for that reason deliberately adopted the prohibition. There are a host of objections to this theory. (Cf. Durkheim, 1898, [33 ff.].) Not only must the prohibition against incest be older than any domestication of animals which might have enabled men to observe the effects of inbreeding upon racial characters, but even today the detrimental results of inbreeding are not established with certainty and cannot easily be demonstrated in man. Moreover, everything that we know of contemporary savages makes it highly improbable that their most remote ancestors were already concerned with the question of preserving their later progeny from injury. Indeed it is almost absurd to attribute to such improvident creatures motives of hygiene and eugenics to which consideration is scarcely paid in our own present-day civilization.[1]

Lastly, account must be taken of the fact that a prohibition against inbreeding, based upon practical motives of hygiene, on the ground of its tending to racial enfeeblement, seems quite inadequate to explain the profound abhorrence shown towards incest in our society. As I have shown elsewhere,[2] this feeling seems to be even more active and intense among contemporary primitive peoples than among civilized ones.

It might have been expected that here again we should have before us a choice between sociological, biological and psychological explanations. (In this connection the psychological motives should perhaps be regarded as representing [*Repräsentanz*] biological forces.) Nevertheless, at the end of our inquiry, we can only subscribe to Frazer's resigned [125] conclusion. We are ignorant of the origin of the horror of incest and cannot even tell in what direction to look for it. None of the solutions to the enigma that have been proposed seems satisfactory.[3]

I must, however, mention one other attempt at solving it. It is of a kind quite different from any that we have so far considered, and might be described as 'historical'.

1 Darwin [1875, **2**, 127] writes of savages that they 'are not likely to reflect on distant evils to their progeny'.

2 See the first essay in this work [p. 18 above].

3 'Thus the ultimate origin of exogamy, and with it of the law of incest – since exogamy was devised to prevent incest – remains a problem nearly as dark as ever.' (Frazer, 1910, **1**, 165.)

This attempt is based upon a hypothesis of Charles Darwin's upon the social state of primitive men. Darwin deduced from the habits of the higher apes that men, too, originally lived in comparatively small groups or hordes [*Horden*][1] within which the jealousy of the oldest and strongest male prevented sexual promiscuity. 'We may indeed conclude from what we know of the jealousy of all male quadrupeds, armed, as many of them are, with special weapons for battling with their rivals, that promiscuous intercourse in a state of nature is extremely improbable. . . . Therefore, if we look far enough back in the stream of time, . . . judging from the social habits of man as he now exists . . . the most probable view is that primaeval man aboriginally lived in small communities, each with as many wives as he could support and obtain, whom he would have jealously guarded against all other men. Or he may have lived with several wives by himself, like the Gorilla; for all the natives "agree that but one adult male is seen in a band; when the young male grows up, a contest takes place for mastery, and the strongest, by killing and driving out the others, establishes himself as the head of the community". (Dr Savage, in *Boston Journal of Nat. Hist.*, vol. v, 1845–7, [p. 423].) The younger males, being thus expelled and wandering about, would, when at last successful in finding a partner, prevent too close interbreeding within the limits of the same family.' (Darwin, 1871, **2**, 362 f.)

Atkinson (1903) seems to have been the first to realize that the practical [126]
consequence of the conditions obtaining in Darwin's primal horde must be exogamy for the young males. Each of them might, after being driven out, establish a similar horde, in which the same prohibition upon sexual intercourse would rule owing to its leader's jealousy. In course of time this would produce what grew into a conscious law: 'No sexual relations between those who share a common home.' After the establishment of totemism this regulation would assume another form and would run: 'No sexual relations within the totem.'

Andrew Lang (1905, 114 and 143) accepted this explanation of exogamy. In the same volume, however, he supports the other theory (held by Durkheim), according to which exogamy was a resultant of the totemic laws. [Cf. p. 112 f. above.] It is a little difficult to bring these two points of view into harmony: according to the first theory exogamy would have

1 [Freud's use, here and subsequently, of the word 'horde' may give rise to confusion. In ordinary English usage 'horde' suggests a very large and unorganized mass of people. The present context makes it plain that Freud uses the word to denote a more or less organized group of limited size – what Atkinson (1903) terms 'the cyclopean family'. See *RSE*, **24**, 75–7.]

originated before totemism, while according to the second it would have been derived from it.[1]

(3)

Into this obscurity one single ray of light is thrown by psychoanalytic observation.

There is a great deal of resemblance between the relations of children and of primitive men towards animals. Children show no trace of the
[127] arrogance which urges adult civilized men to draw a hard and fast line between their own nature and that of all other animals. Children have no scruples over allowing animals to rank as their full equals. Uninhibited as they are in the avowal of their bodily needs, they no doubt feel themselves more akin to animals than to their elders, who may well be a puzzle to them.

Not infrequently, however, a strange rift occurs in the excellent relations between children and animals. A child will suddenly begin to be frightened of some particular species of animal and to avoid touching or seeing any individual of that species. The clinical picture of an *animal phobia* emerges – a very common, and perhaps the earliest, form of psychoneurotic illness occurring in childhood. As a rule the phobia is attached to animals in which the child has hitherto shown a specially lively interest and it has nothing to do with any particular individual animal. There is no large choice of animals that may become objects of a phobia in the case of children living in towns: horses, dogs, cats, less often birds, and with striking frequency very small creatures such as beetles and butterflies. The senseless and immoderate fear shown in these phobias is sometimes attached to animals only known to the child from picture-books and fairy tales. On a few rare occasions it is possible to discover what has led to an unusual choice of this kind; and I have to thank Karl Abraham for telling me of a case in which the child himself explained that his fear of wasps was due to their colour and stripes

1 'If it be granted that exogamy existed in practice, on the lines of Mr. Darwin's theory, before the totem beliefs lent to the practice a *sacred* sanction, our task is relatively easy. The first practical rule would be that of the jealous Sire, "No males to touch the females in my camp", with expulsion of adolescent sons. *In efflux of time that rule, become habitual*, would be, "No marriage within the local group". Next, let the local groups receive names, such as Emus, Crows, Opossums, Snipes, and the rule becomes, "No marriage within the local group of animal name; no Snipe to marry Snipe". But, if the primal groups were not exogamous, they would become so, as soon as totemic myths and tabus were developed out of the animal, vegetable, and other names of local groups.' (Lang, 1905, 143.) (The italics in the middle of this passage are mine.) In his last discussion of this subject, moreover, Lang (1911, [404]) states that he has 'abandoned the idea that exogamy is a consequence of the general totemic taboo'.

reminding him of tigers, which from all accounts were beasts to be feared.[1]

No detailed analytic examination has yet been made of children's animal phobias, though they would greatly repay study. This neglect has no doubt been due to the difficulty of analysing children of such a tender age. It cannot therefore be claimed that we know the general meaning of these disorders and I myself am of the opinion that this may not turn out to be of a uniform nature. But a few cases of phobias of this kind directed towards the larger animals have proved accessible to analysis and have thus yielded their secret to the investigator. It was the same in every case: where the children concerned were boys, their fear related [128] at bottom to their father and had merely been displaced on to the animal.

Everyone with psychoanalytic experience will no doubt have come across cases of the sort and have derived the same impression from them. Yet I can quote only a few detailed publications on the subject. This paucity of literature is an accidental circumstance and it must not be supposed that our conclusions are based on a few scattered observations. I may mention, for instance, a writer who has studied the neuroses of childhood with great understanding – Dr M. Wulff, of Odessa.[2] In the course of a case history of a nine-year-old boy he reports that at the age of four the patient had suffered from a dog phobia. 'When he saw a dog running past in the street, he would weep and call out: "Dear doggie, don't bite me! I'll be good!" By "being good" he meant "not playing on the fiddle"' – not masturbating. (Wulff, 1912, 15.) 'The boy's dog phobia', the author explains, 'was in reality his fear of his father displaced on to dogs; for his curious exclamation "Doggie, I'll be good!" – that is, "I won't masturbate" – was directed to his father, who had forbidden him to masturbate.' Wulff adds a footnote which is in complete agreement with my views and at the same time bears witness to the frequent occurrence of such experiences: 'Phobias of this type (phobias of horses, dogs, cats, fowls and other domestic animals) are, in my opinion, at least as common in childhood as *pavor nocturnus*; and in analysis they almost invariably turn out to be a displacement on to the animals of the child's fear of one of his parents. I should not be prepared to maintain that the same mechanism applies to the widespread phobias of rats and mice.' [Ibid., 16.]

I recently published (1909*b*) an 'Analysis of a Phobia in a Five-Year-Old

1 [Subsequently published. (Abraham, 1914, 82; English translation, 228.)]

2 [Later Dr M. Woolf of Tel-Aviv.]

Boy',[1] the material of which was supplied to me by the little patient's father. The boy had a phobia of horses, and as a result he refused to go out in the street. He expressed a fear that the horse would come into the room and bite him; and it turned out that this must be the punishment for a wish that the horse might fall down (that is, die). After the boy's fear of his father had been removed by reassurances, it became evident
[129] that he was struggling against wishes which had as their subject the idea of his father being absent (going away on a journey, dying). He regarded his father (as he made all too clear) as a competitor for the favours of his mother, towards whom the obscure foreshadowings of his budding sexual wishes were aimed. Thus he was situated in the typical attitude of a male child towards his parents to which we have given the name of the 'Oedipus complex' and which we regard in general as the nuclear complex of the neuroses. The new fact that we have learnt from the analysis of 'Little Hans' – a fact with an important bearing upon totemism – is that in such circumstances children displace some of their feelings from their father on to an animal.

Analysis is able to trace the associative paths along which this displacement passes – both the fortuitous paths and those with a significant content. Analysis also enables us to discover the *motives* for the displacement. The hatred of his father that arises in a boy from rivalry for his mother is not able to achieve uninhibited sway over his mind; it has to contend against his old-established affection and admiration for the very same person. The child finds relief from the conflict arising out of this double-sided, this *ambivalent* emotional attitude towards his father by displacing his hostile and fearful feelings on to a *substitute* for his father. The displacement cannot, however, bring the conflict to an end, it cannot effect a clear-cut severance between the affectionate and the hostile feelings. On the contrary, the conflict is resumed in relation to the object on to which the displacement has been made: the ambivalence is extended to *it*. There could be no doubt that Little Hans was not only *frightened* of horses; he also approached them with admiration and interest. As soon as his anxiety began to diminish, he identified himself with the dreaded creature: he began to jump about like a horse and in his turn bit his father.[2] At another stage in the resolution of his phobia he did not hesitate to identify his parents with some other large animals.[3]

1 [*RSE*, **10**, 5 ff.]

2 Freud (1909*b* [ibid., 40]).

3 In his giraffe phantasy [ibid., 29 ff.].

It may fairly be said that in these children's phobias some of the features of totemism reappear, but reversed into their negative. We are, however, indebted to Ferenczi (1913*a*) for an interesting history of a single [130]
case which can only be described as an instance of *positive* totemism in a child. It is true that in the case of little Árpád (the subject of Ferenczi's report) his totemic interests did not arise in direct relation with his Oedipus complex but on the basis of its narcissistic precondition, the fear of castration. But any attentive reader of the story of Little Hans will find abundant evidence that he, too, admired his father as possessing a big penis and feared him as threatening his own. The same part is played by the father alike in the Oedipus and the castration complexes – the part of a dreaded enemy to the sexual interests of childhood. The punishment which he threatens is castration, or its substitute, blinding.[1]

When little Árpád was two and a half years old, he had once, while he was on a summer holiday, tried to micturate into the fowl house and a fowl had pecked, or pecked *at* his penis. A year later, when he was back in the same place, he himself turned into a fowl; his one interest was in the fowl house and in what went on there and he abandoned human speech in favour of cackling and crowing. At the time at which the observation was made (when he was five years old) he had recovered his speech, but his interests and his talk were entirely concerned with chickens and other kinds of poultry. They were his only toys and he only sang songs that had some mention of fowls in them. His attitude towards his totem animal was superlatively ambivalent: he showed both hatred and love to an extravagant degree. His favourite game was playing slaughtering fowls. 'The slaughtering of poultry was a regular festival for him. He would dance round the animals' bodies for hours at a time in a state of intense excitement.'[2] But afterwards he would kiss and stroke the slaughtered animal or would clean and caress the toy fowls that he had himself ill-treated.

Little Árpád himself saw to it that the meaning of his strange behaviour should not remain hidden. From time to time he translated his wishes from the totemic language into that of everyday life. 'My father's the cock', he said on one occasion, and another time: 'Now I'm small, now [131]
I'm a chicken. When I get bigger I'll be a fowl. When I'm bigger still I'll be a cock.' On another occasion he suddenly said he would like to eat some 'fricassee of mother' (on the analogy of fricassee of chicken). [Ibid., 249.] He was very generous in threatening other people with

1 For the substitution of blinding for castration – a substitution that occurs, too, in the myth of Oedipus – see Reitler (1913*a*), Ferenczi (1913*d*), Rank (1913*a*) and Eder (1913).

2 [Ferenczi, 1913*a* (English translation, 246).]

castration, just as he himself had been threatened with it for his masturbatory activities.

There was no doubt, according to Ferenczi, as to the sources of Árpád's interest in events in the poultry yard: 'the continual sexual activity between the cock and hens, the laying of eggs and the hatching out of the young brood' gratified his sexual curiosity, the real object of which was *human* family life. [Ibid., 250.] He showed that he had formed his own choice of sexual objects on the model of life in the hen run, for he said one day to the neighbour's wife: 'I'll marry you and your sister and my three cousins and the cook; no, not the cook, I'll marry my mother instead.' [Ibid., 252.]

Later on we shall be able to assess the worth of this observation more completely. At the moment I will emphasize only two features in it which offer valuable points of agreement with totemism: the boy's complete identification with his totem animal[1] and his ambivalent emotional attitude to it. These observations justify us, in my opinion, in substituting the father for the totem animal in the formula for totemism (in the case of males). It will be observed that there is nothing new or particularly daring in this step forward. Indeed, primitive men say the very same thing themselves, and, where the totemic system is still in force today, they describe the totem as their common ancestor and primal father. All we have done is to take at its literal value an expression used by these people, of which the anthropologists have been able to make very little and which they have therefore been glad to keep in the background. Psychoanalysis, on the contrary, leads us to put special stress upon this same point and to take it as the starting point of our attempt at explaining totemism.[2]

[132] The first consequence of our substitution is most remarkable. If the totem animal is the father, then the two principal ordinances of totemism, the two taboo prohibitions which constitute its core – not to kill the totem and not to have sexual relations with a woman of the same totem – coincide in their content with the two crimes of Oedipus, who killed his father and married his mother, as well as with the two primal wishes of children, the insufficient repression or the reawakening of which forms the nucleus of perhaps every psychoneurosis. If this

1 This, according to Frazer (1910, **4**, 5), constitutes 'the whole essence of totemism': 'totemism is an identification of a man with his totem'.

2 I have to thank Otto Rank for bringing to my notice a dog phobia in an intelligent young man. His explanation of the way in which he acquired his illness sounds markedly like the totemic theory of the Arunta which I mentioned on page 108: he thought he had heard from his father that his mother had had a severe fright from a dog during her pregnancy.

equation is anything more than a misleading trick of chance, it must enable us to throw a light upon the origin of totemism in the inconceivably remote past. In other words, it would enable us to make it probable that the totemic system – like Little Hans's animal phobia and little Árpád's poultry perversion – was a product of the conditions involved in the Oedipus complex. In order to pursue this possibility, we shall have, in the following pages, to study a feature of the totemic system (or, as we might say, of the totemic religion) which I have hitherto scarcely found an opportunity of mentioning.

(4)

William Robertson Smith, who died in 1894 – physicist, philologist, Bible critic and archaeologist – was a man of many-sided interests, clear-sighted and liberal-minded. In his book on the *Religion of the Semites* (first published in 1889)[1] he put forward the hypothesis that a peculiar ceremony known as the 'totem meal' had from the very first formed an integral part of the totemic system. At that time he had only a single piece of evidence in support of his theory: an account of a procedure of the kind dating from the fifth century A.D. But by an analysis of the nature of sacrifice among the ancient Semites he was able to lend his hypothesis a high degree of probability. Since sacrifice implies a divinity, it was a question of arguing back from a comparatively high phase of religious ritual [133]
to the lowest one, that is, to totemism.

I will now attempt to extract from Robertson Smith's admirable work those of his statements on the origin and meaning of the ritual of sacrifice which are of decisive interest for us. In so doing I must omit all the details, often so fascinating, and neglect all the later developments. It is quite impossible for an abstract such as this to give my readers any notion of the lucidity and convincing force of the original.

Robertson Smith [1894, 214] explains that sacrifice at the altar was the essential feature in the ritual of ancient religions. It plays the same part in all religions, so that its origin must be traced back to very general causes, operating everywhere in the same manner. Sacrifice – the sacred act *par excellence* (*sacrificium*, *ἱερουργία*) – originally had a somewhat different meaning, however, from its later one of making an offering to the deity in order to propitiate him or gain his favour. (The non-religious usage of the word followed from this subsidiary sense of 'renunciation'.

1 [The second and revised edition, which is the one here quoted, appeared posthumously in 1894.]

[See below, p. 138.]) It can be shown that, to begin with, sacrifice was nothing other than 'an act of fellowship between the deity and his worshippers'. [1894, 224.]

The materials offered for sacrifice were things that can be eaten or drunk; men sacrificed to their deity the things on which they themselves lived: flesh, cereals, fruit, wine and oil. Only in the case of flesh were there limitations and exceptions. The god shared the animal sacrifices with his worshippers, the vegetable offerings were for him alone. There is no doubt that animal sacrifices were the older and were originally the only ones. Vegetable sacrifices arose from the offering of first-fruits and were in the nature of a tribute to the lord of the earth and of the land; but animal sacrifices are more ancient than agriculture. [Ibid., 222.]

Linguistic survivals make it certain that the portion of the sacrifice allotted to the god was originally regarded as being literally his food. As the nature of gods grew progressively less material, this conception became a stumbling block. It was avoided by assigning to the deity only the *liquid* part of the meal. Later, the use of fire, which caused the flesh of the sacrifice upon the altar to rise in smoke, afforded a method of dealing with human food more appropriate to the divine nature. [Ibid., 224, 229.] The drink-offering consisted originally of the blood of the animal victim. This was later replaced with wine. In ancient times wine was regarded as 'the blood of the grape', and it has been so described by modern poets. [Ibid., 230.]

[134]

The oldest form of sacrifice, then, older than the use of fire or the knowledge of agriculture, was the sacrifice of animals, whose flesh and blood were enjoyed in common by the god and his worshippers. It was essential that each one of the participants should have his share of the meal.

A sacrifice of this kind was a public ceremony, a festival celebrated by the whole clan. Religion in general was an affair of the community and religious duty was a part of social obligation. Everywhere a sacrifice involves a feast and a feast cannot be celebrated without a sacrifice. The sacrificial feast was an occasion on which individuals rose joyously above their own interests and stressed the mutual dependence existing between one another and their god. [Ibid., 255.]

The ethical force of the public sacrificial meal rested upon very ancient ideas of the significance of eating and drinking together. Eating and drinking with a man was a symbol and a confirmation of fellowship and mutual social obligations. What was *directly* expressed by the sacrificial meal was only the fact that the god and his worshippers were

'commensals',[1] but every other point in their mutual relations was included in this. Customs still in force among the Arabs of the desert show that what is binding in a common meal is not a religious factor but the act of eating itself. Anyone who has eaten the smallest morsel of food with one of these Bedouin or has swallowed a mouthful of his milk need no longer fear him as an enemy but may feel secure in his protection and help. Not, however, for an unlimited time; strictly speaking, only so long as the food which has been eaten in common remains in the body. Such was the realistic view of the bond of union. It needed repetition in order to be confirmed and made permanent. [Ibid., 269–70.]

But why is this binding force attributed to eating and drinking together? In primitive societies there was only one kind of bond which [135] was absolute and inviolable – that of kinship. The solidarity of such a fellowship was complete. 'A kin was a group of persons whose lives were so bound up together, in what must be called a physical unity, that they could be treated as parts of one common life. . . . In a case of homicide Arabian tribesmen do not say, "The blood of M. or N. has been spilt", naming the man; they say, "Our blood has been spilt". In Hebrew the phrase by which one claims kinship is "I am your bone and your flesh".' Thus kinship implies participation in a common substance. It is therefore natural that it is not merely based on the fact that a man is a part of his mother's substance, having been born of her and having been nourished by her milk, but that it can be acquired and strengthened by food which a man eats later and with which his body is renewed. If a man shared a meal with his god he was expressing a conviction that they were of one substance; and he would never share a meal with one whom he regarded as a stranger. [Ibid., 273–5.]

The sacrificial meal, then, was originally a feast of kinsmen, in accordance with the law that only kinsmen eat together. In our own society the members of a family have their meals in common; but the sacrificial meal bears no relation to the family. Kinship is an older thing than family life, and in the most primitive societies known to us the family contained members of more than one kindred. The man married a woman of another clan and the children inherited their mother's clan; so that there was no communion of kin between the man and the other members of the family. In a family of such a kind there was no common meal. To this day, savages eat apart and alone and the religious food prohibitions of totemism often make it impossible for them to eat in common with their wives and children. [Ibid., 277–8.]

1 [I.e. that they sat at one table.]

Let us now turn to the sacrificial animal. As we have heard, there is no gathering of a clan without an animal sacrifice, nor – and this now becomes significant – any slaughter of an animal except upon these ceremonial occasions. While fruit, game and the milk of domestic animals might be consumed without any qualms, religious scruples made it impossible to kill a domestic animal for private purposes. [Ibid., 280, 281.] There cannot be the slightest doubt, says Robertson Smith, that the
[136] *slaughter of a victim* was originally among the acts which '*are illegal to an individual, and can only be justified when the whole clan shares the responsibility of the deed*.[1] So far as I know, there is only one class of actions recognized by early nations to which this description applies, viz. actions which involve an invasion of the sanctity of the tribal blood. In fact, a life which no single tribesman is allowed to invade, and which can be sacrificed only by the consent and common action of the kin, stands on the same footing with the life of the fellow-tribesman.' The rule that every participant at the sacrificial meal must eat a share of the flesh of the victim has the same meaning as the provision that the execution of a guilty tribesman must be carried out by the tribe as a whole. [Ibid., 284–5.] In other words, the sacrificial animal was treated as a member of the tribe; *the sacrificing community, the god and the sacrificial animal were of the same blood and members of one clan*.

Robertson Smith brings forward copious evidence for identifying the sacrificial animal with the primitive totem animal. In later antiquity there were two classes of sacrifice: one in which the victims were domestic animals of the kinds habitually used for eating, and the other extraordinary sacrifices of animals which were unclean and whose consumption was forbidden. Investigation shows that these unclean animals were sacred animals, that they were offered as sacrifices to the gods to whom they were sacred, that originally they were identical to the gods themselves, and that by means of the sacrifice the worshippers in some way laid stress upon their blood kinship with the animal and the god. [Ibid., 290–5.] But in still earlier times this distinction between ordinary and 'mystic' sacrifices disappears. Originally *all* [sacrificial] animals were sacred, their flesh was forbidden meat and might only be consumed on ceremonial occasions and with the participation of the whole clan. The slaughter of [such] an animal was equivalent to a shedding of the tribal blood and could occur subject only to the same precautions and the same insurances against incurring reproach. [Ibid., 312, 313.]

[137] The domestication of animals and the introduction of cattle-breeding

1 [This sentence is italicized by Freud.]

seems everywhere to have brought to an end the strict and unadulterated totemism of primaeval days.[1] But such sacred character as remained to domestic animals under what had then become 'pastoral' religion is obvious enough to allow us to infer its original totemic nature. Even in late classical times ritual prescribed in many places that the sacrificial priest must take to flight after performing the sacrifice, as though to escape retribution. The idea that slaughtering oxen was a crime must at one time have prevailed generally in Greece. At the Athenian festival of Buphonia ['ox-murder'] a regular trial was instituted after the sacrifice, and all the participants were called as witnesses. At the end of it, it was agreed that the responsibility for the murder should be placed upon the knife; and this was accordingly cast into the sea. [Smith, 1894, 304.]

In spite of the ban protecting the lives of sacred animals in their quality of fellow clansmen, a necessity arose for killing one of them from time to time in solemn communion and for dividing its flesh and blood among the members of the clan. The compelling motive for this deed reveals the deepest meaning of the nature of sacrifice. We have heard how in later times, whenever food is eaten in common, the participation in the same substance establishes a sacred bond between those who consume it when it has entered their bodies. In ancient times this result seems only to have been effected by participation in the substance of a *sacrosanct* victim. *The holy mystery of sacrificial death 'is justified by the consideration that only in this way can the sacred cement be procured which creates or keeps alive a living bond of union between the worshippers and their god'*.[2] (Ibid., 313.)

This bond is nothing else than the life of the sacrificial animal, which resides in its flesh and in its blood and is distributed among all the participants in the sacrificial meal. A notion of this kind lies at the root of all the *blood covenants* by which men made compacts with each other even at a late period of history. [Loc. cit.] This completely literal way of regarding blood kinship as identity of substance makes it easy to understand the [138]
necessity for renewing it from time to time by the physical process of the sacrificial meal. [Ibid., 319.]

At this point I will interrupt my survey of Robertson Smith's line of thought and restate the gist of it in the most concise terms. With the establishment of the idea of private property sacrifice came to be looked upon as a gift to the deity, as a transference [*Übertragung*] of property

1 'The inference is that the domestication to which totemism inevitably leads (when there are any animals capable of domestication) is fatal to totemism.' (Jevons, 1902, 120.)

2 [This sentence is italicized by Freud.]

from men to the god. But this interpretation left unexplained all the peculiarities of the ritual of sacrifice. In the earliest times the sacrificial animal had itself been sacred and its life untouchable; it might only be killed if all the members of the clan participated in the deed and shared their guilt in the presence of the god, so that the sacred substance could be yielded up and consumed by the clansmen and thus ensure their identity with one another and with the deity. The sacrifice was a sacrament and the sacrificial animal was itself a member of the clan. It was, in fact, the ancient totem animal, the primitive god himself, by the killing and consuming of which the clansmen renewed and assured their likeness to the god.

From this analysis of the nature of sacrifice Robertson Smith draws the conclusion that the periodic killing and eating of the totem in times *before the worship of anthropomorphic deities* had been an important element in totemic religion. [Ibid., 295.] The ceremonial of a totem meal of this kind is, he suggests, to be found in a description of a sacrifice of comparatively late date. St Nilus records a sacrificial ritual current among the Bedouin of the Sinai Desert at the end of the fourth century A.D. The victim of the sacrifice, a camel, 'is bound upon a rude altar of stones piled together, and when the leader of the band has thrice led the worshippers round the altar in a solemn procession accompanied with chants, he inflicts the first wound . . . and in all haste drinks of the blood that gushes forth. Forthwith the whole company fall on the victim with their swords, hacking off pieces of the quivering flesh and devouring them raw with such wild haste, that in the short interval between the rise of the day star[1] which marked the hour for the service to begin, and the disappearance of its rays before the rising sun, the entire camel, body and bones, skin, blood and entrails, is wholly devoured.' [Ibid., 338.] All the evidence goes to show that this barbaric
[139] ritual, which bears every sign of extreme antiquity, was no isolated instance but was everywhere the original form taken by totemic sacrifice, though later toned down in many different directions.

Many authorities have refused to attach importance to the concept of the totem meal, because it was not supported by any direct observation at the level of totemism. Robertson Smith himself pointed to instances in which the sacramental significance of the sacrifice seemed to be assured: for instance, the human sacrifices of the Aztecs, and others which recall the circumstances of the totem meal – the sacrifice of bears by the Bear clan of the Ouataouak [Otawa] tribe in America and the

1 To which the sacrifice was offered.

bear feast of the Aino in Japan. [Ibid., 295 *n*.] These and similar cases have been reported in detail by Frazer in the Fifth Part of his great work (1912, **2** [Chaps. X, XIII, XIV]). An American Indian tribe in California, which worship a large bird of prey (a buzzard), kill it once a year at a solemn festival, after which it is mourned and its skin and feathers are preserved. [Ibid., **2**, 170.] The Zuni Indians of New Mexico behave in a similar way to their sacred turtles. [Ibid., **2**, 175.]

A feature has been observed in the *intichiuma* ceremonies of the Central Australian tribes which agrees admirably with Robertson Smith's conjectures. Each clan, when it is performing magic for the multiplication of its totem (which it itself is normally prohibited from consuming), is obliged during the ceremony to eat a small portion of its own totem before making it accessible to the other clans. [Frazer, 1910, **1**, 110 ff.] According to Frazer (ibid., **2**, 590) the clearest example of a sacramental consumption of an otherwise prohibited totem is to be found among the Bini of West Africa in connection with their funeral ceremonies.

Accordingly, I propose that we should adopt Robertson Smith's hypothesis that the sacramental killing and communal eating of the totem animal, whose consumption was forbidden on all other occasions, was an important feature of totemic religion.[1]

(5)

Let us call up the spectacle of a totem meal of the kind we have been [140]
discussing, amplified by a few probable features which we have not yet been able to consider. The clan is celebrating the ceremonial occasion by the cruel slaughter of its totem animal and is devouring it raw – blood, flesh and bones. The clansmen are there, dressed in the likeness of the totem and imitating it in sound and movement, as though they are seeking to stress their identity with it. Each man is conscious that he is performing an act forbidden to the individual and justifiable only through the participation of the whole clan; nor may anyone absent himself from the killing and the meal. When the deed is done, the slaughtered animal is lamented and bewailed. The mourning is obligatory, imposed by dread of a threatened retribution. As Robertson Smith (1894, 412) remarks of an analogous occasion, its chief purpose is to disclaim responsibility for the killing.

1 I am not unaware of the objections to this theory of sacrifice which have been brought forward by various writers (such as Marillier [1898, 204 ff.], Hubert & Mauss [1899, 30 ff.], etc.); but they have not diminished to any important extent the impression produced by Robertson Smith's hypothesis.

But the mourning is followed by demonstrations of festive rejoicing: every drive is unfettered and there is licence for every kind of gratification. Here we have easy access to an understanding of the nature of festivals in general. A festival is a permitted, or rather an obligatory, excess, a solemn breach of a prohibition. It is not that men commit the excesses because they are feeling happy as a result of some injunction they have received. It is rather that excess is of the essence of a festival; the festive feeling is produced by the liberty to do what is as a rule prohibited.

What are we to make, though, of the prelude to this festive joy – the mourning over the death of the animal? If the clansmen rejoice over the killing of the totem – a normally forbidden act – why do they mourn over it as well?

As we have seen, the clansmen acquire sanctity by consuming the totem: they reinforce their identification with it and with one another. Their festive feelings and all that follows from them might well be
[141] explained by the fact that they have taken into themselves the sacred life of which the substance of the totem is the vehicle.

Psychoanalysis has revealed that the totem animal is in reality a substitute for the father; and this tallies with the contradictory fact that, though the killing of the animal is as a rule forbidden, yet its killing is a festive occasion – with the fact that it is killed and yet mourned. The ambivalent emotional attitude, which to this day characterizes the father complex in our children and which often persists into adult life, seems to extend to the totem animal in its capacity as substitute for the father.

If, now, we bring together the psychoanalytic translation of the totem with the fact of the totem meal and with Darwin's theories of the earliest state of human society, the possibility of a deeper understanding emerges – a glimpse of a hypothesis which may seem fantastic but which offers the advantage of establishing an unsuspected correlation between groups of phenomena that have hitherto been disconnected.

There is, of course, no place for the beginnings of totemism in Darwin's primal horde. All that we find there is a violent and jealous father who keeps all the females for himself and drives away his sons as they grow up. This earliest state of society has never been an object of observation. The most primitive kind of organization that we actually come across – and one that is in force to this day in certain tribes – consists of *bands of males*; these bands are composed of members with equal rights and are subject to the restrictions of the totemic system, including inheritance through the mother. Can this form of

organization have developed out of the other one? and if so along what lines?

If we call the celebration of the totem meal to our help, we shall be able to find an answer. One day[1] the brothers who had been driven out came together, killed and devoured their father and so made an end of the patriarchal horde. United, they had the courage to do and succeeded in doing what would have been impossible for them individually. (Some cultural advance, perhaps, command over some new weapon, had given them a sense of superior strength.) Cannibal savages as they were, it goes [142] without saying that they devoured their victim as well as killing him. The violent primal father had doubtless been the feared and envied model of each one of the company of brothers: and in the act of devouring him they accomplished their identification with him, and each one of them acquired a portion of his strength. The totem meal, which is perhaps mankind's earliest festival, would thus be a repetition and a commemoration of this memorable and criminal deed, which was the beginning of so many things – of social organization, of moral restrictions and of religion.[2]

In order that these latter consequences may seem plausible, leaving [143]

1 To avoid possible misunderstanding, I must ask the reader to take into account the final sentences of the following footnote as a corrective to this description.

2 This hypothesis, which has such a monstrous air, of the tyrannical father being overwhelmed and killed by a combination of his exiled sons, was also arrived at by Atkinson (1903, 220 f.) as a direct implication of the state of affairs in Darwin's primal horde: 'The patriarch had only one enemy whom he should dread . . . a youthful band of brothers living together in forced celibacy, or at most in polyandrous relation with some single female captive. A horde as yet weak in their impubescence they are, but they would, when strength was gained with time, inevitably wrench by combined attacks, renewed again and again, both wife and life from the paternal tyrant.' Atkinson, who incidentally passed his whole life in New Caledonia and had unusual opportunities for studying the natives, also pointed out that the conditions which Darwin assumed to prevail in the primal horde may easily be observed in herds of wild oxen and horses and regularly lead to the killing of the father of the herd. [Ibid., 222 f.] He further supposed that, after the father had been disposed of, the horde would be disintegrated by a bitter struggle between the victorious sons. Thus any new organization of society would be precluded: there would be 'an ever-recurring violent succession to the solitary paternal tyrant, by sons *whose parricidal hands were so soon again clenched in fratricidal strife*'. (Ibid., 228.) Atkinson, who had no psychoanalytic hints to help him and who was ignorant of Robertson Smith's studies, found a less violent transition from the primal horde to the next social stage, at which numbers of males live together in a peaceable community. He believed that through the intervention of maternal love the sons – to begin with only the youngest, but later others as well – were allowed to remain with the horde, and that in return for this toleration the sons acknowledged their father's sexual privilege by renouncing all claim to their mother and sisters. [Ibid., 231 ff.]

Such is the highly remarkable theory put forward by Atkinson. In its essential feature it is in agreement with my own; but its divergence results in its failing to effect a correlation with many other issues.

The lack of precision in what I have written in the text above, its abbreviation of the time factor and its compression of the whole subject matter, may be attributed to the reserve necessitated by the nature of the topic. It would be as foolish to aim at exactitude in such questions as it would be unfair to insist upon certainty.

their premises on one side, we need only suppose that the tumultuous mob of brothers were filled with the same contradictory feelings which we can see at work in the ambivalent father complexes of our children and of our neurotic patients. They hated their father, who presented such a formidable obstacle to their craving for power and their sexual desires; but they loved and admired him too. After they had got rid of him, had satisfied their hatred and had put into effect their wish to identify themselves with him, the affection which had all this time been pushed under was bound to make itself felt.[1] It did so in the form of remorse. A sense of guilt made its appearance, which in this instance coincided with the remorse felt by the whole group. The dead father became stronger than the living one had been – for events took the course we so often see them follow in human affairs to this day. What had up to then been prevented by his actual existence was thenceforward prohibited by the sons themselves, in accordance with the psychological procedure so familiar to us in psychoanalyses under the
Nachträglichkeit name of 'deferred obedience'[2] ['*nachträglichen Gehorsams*'][T]. They revoked their deed by forbidding the killing of the totem, the substitute for their father; and they renounced its fruits by resigning their claim to the women who had now been set free. They thus created out of their *filial sense of guilt* the two fundamental taboos of totemism, which for that very reason inevitably corresponded to the two repressed wishes of the Oedipus complex. Whoever contravened those taboos became guilty of the only two crimes with which primitive society concerned itself.[3]

[144] The two taboos of totemism with which human morality has its beginning are not on a par psychologically. The first of them, the law protecting the totem animal, is founded wholly on emotional motives: the father had actually been eliminated, and in no real sense could the deed be undone [*gutzumachen*]. But the second rule, the prohibition of incest, has a powerful practical basis as well. Sexual desires do not unite men but divide them. Though the brothers had banded together in order to overcome their father, they were all one another's rivals in regard to the women. Each of them would have wished, like his father, to have all

1 This fresh emotional attitude must also have been assisted by the fact that the deed cannot have given complete satisfaction to those who did it. From one point of view it had been done in vain. Not one of the sons had in fact been able to put his original wish – of taking his father's place – into effect. And, as we know, failure is far more propitious for a moral reaction than satisfaction.

2 [An example of 'deferred obedience' is provided in the analysis of 'Little Hans' (1909*b*), *RSE*, **10**, 28.]

3 'Murder and incest, or offences of a like kind against the sacred laws of blood, are in primitive society the only crimes of which the community as such takes cognizance.' (Smith, 1894, 419.)

the women to himself. The new organization would have collapsed in a struggle of all against all, for none of them was of such overmastering strength as to be able to take on his father's part with success. Thus the brothers had no alternative, if they were to live together, but – not, perhaps, until they had passed through many dangerous crises – to institute the law against incest, by which they all alike renounced the women whom they desired and who had been their chief motive for despatching their father. In this way they rescued the organization which had made them strong – and which may have been based on homosexual feelings and acts, originating perhaps during the period of their expulsion from the horde. Here, too, may perhaps have been the germ of the institution of matriarchy, described by Bachofen [1861], which was in turn replaced with the patriarchal organization of the family.

On the other hand, the claim of totemism to be regarded as a first attempt at a religion is based on the first of these two taboos – that upon taking the life of the totem animal. The animal struck the sons as a natural and obvious substitute for their father; but the treatment of it which they found imposed on themselves expressed more than the need to exhibit their remorse. They could attempt, in their relation to this surrogate father, to allay their burning sense of guilt, to bring about a kind of reconciliation with their father. The totemic system was, as it were, a covenant with their father, in which he promised them everything that a childish imagination may expect from a father – protection, care and indulgence – while on their side they undertook to respect his life, that is to say, not to repeat the deed which had brought destruction on their real father. Totemism, moreover, contained an attempt at self-justification: [145]
'If our father had treated us in the way the totem does, we should never have felt tempted to kill him.' In this fashion totemism helped to smooth things over and to make it possible to forget the event to which it owed its origin.

Features were thus brought into existence which continued thenceforward to have a determining influence on the nature of religion. Totemic religion arose from the filial sense of guilt, in an attempt to allay that feeling and to appease the father by deferred obedience to him. All later religions are seen to be attempts at solving the same problem. They vary according to the stage of civilization at which they arise and according to the methods which they adopt; but all have the same end in view and are reactions to the same great event with which civilization began and which, since it occurred, has not allowed mankind a moment's rest.

There is another feature which was already present in totemism and

which has been preserved unaltered in religion. The tension of ambivalence was evidently too great for any contrivance to be able to counteract it; or it is possible that psychological conditions in general are unfavourable to getting rid of these antithetical emotions. However that may be, we find that the ambivalence implicit in the father complex persists in totemism and in religions generally. Totemic religion not only comprised expressions of remorse and attempts at atonement, it also served as a remembrance of the triumph over the father. Satisfaction over that triumph led to the institution of the memorial festival of the totem meal, in which the restrictions of deferred obedience no longer held. Thus it became a duty to repeat the crime of parricide again and again in the sacrifice of the totem animal, whenever, as a result of the changing conditions of life, the cherished fruit of the crime – appropriation of the paternal attributes – threatened to disappear. We shall not be surprised to find that the element of filial rebelliousness also emerges, in the *later* products of religion, often in the strangest disguises and transformations.

Hitherto we have followed the developments of the *affectionate* current of feeling towards the father, transformed into remorse, as we find
[146] them in religion and in moral ordinances (which are not sharply distinguished in totemism). But we must not overlook the fact that it was in the main with the impulses that led to parricide that the victory lay. For a long time afterwards, the social fraternal feelings, which were the basis of the whole transformation, continued to exercise a profound influence on the development of society. They found expression in the sanctification of the blood tie, in the emphasis upon the solidarity of all life within the same clan. In thus guaranteeing one another's lives, the brothers were declaring that no one of them must be treated by another as their father was treated by them all jointly. They were precluding the possibility of a repetition of their father's fate. To the religiously based prohibition against killing the totem was now added the socially based prohibition against fratricide. It was not until long afterwards that the prohibition ceased to be limited to members of the clan and assumed the simple form: 'Thou shalt do no murder.' The patriarchal horde was replaced in the first instance with the fraternal clan, whose existence was assured by the blood tie. Society was now based on complicity in the common crime; religion was based on the sense of guilt and the remorse attaching to it; while morality was based partly on the exigencies of this society and partly on the penance demanded by the sense of guilt.

Thus psychoanalysis, in contradiction to the more recent views of the totemic system but in agreement with the earlier ones, requires us to assume that totemism and exogamy were intimately connected and had a simultaneous origin.

(6)

A great number of powerful motives restrain me from any attempt at picturing the further development of religions from their origin in totemism to their condition today. I will follow only two threads whose course I can trace with particular clarity as they run through the pattern: the theme of the totemic sacrifice and the relation of son to father.[1]

Robertson Smith has shown us that the ancient totem meal recurs in [147]
the original form of sacrifice. The meaning of the act is the same: sanctification through participation in a common meal. The sense of guilt, which can only be allayed by the solidarity of all the participants, also persists. What is new is the clan deity, in whose supposed presence the sacrifice is performed, who participates in the meal as though he were a clansman, and with whom those who consume the meal become identified. How does the god come to be in a situation to which he was originally a stranger?

The answer might be that in the meantime the concept of God had emerged – from some unknown source – and had taken control of the whole of religious life; and that, like everything else that was to survive, the totem meal had been obliged to find a point of contact with the new system. The psychoanalysis of individual human beings, however, teaches us with quite special insistence that the god of each of them is formed in the likeness of his father, that his personal relation to God depends on his relation to his father in the flesh and oscillates and changes along with that relation, and that at bottom God is nothing other than an exalted father. As in the case of totemism, psychoanalysis recommends us to have faith in the believers who call God their father, just as the totem was called the tribal ancestor. If psychoanalysis deserves any attention, then – without prejudice to any other sources or meanings of the concept of God, upon which psychoanalysis can throw no light – the paternal element in that concept must be a most important one. But in that case the father is represented twice over in the situation of primitive sacrifice: once as God and once as the totemic animal victim. And, even

1 Cf. the discussion by C. G. Jung (1911–12), which is governed by views differing in certain respects from mine.

granting the restricted number of explanations open to psychoanalysis, one must ask whether this is possible and what sense it can have.

We know that there are a multiplicity of relations between the god and the sacred animal (the totem or the sacrificial victim). (1) Each god usually has an animal (and quite often several animals) sacred to him. (2) In the case of certain specially sacred sacrifices – 'mystic' sacrifices – the victim was precisely the animal sacred to the god (Smith, 1894, [290]).
[148] (3) The god was often worshipped in the shape of an animal (or, to look at it in another way, animals were worshipped as gods) long after the age of totemism. (4) In myths the god often transforms himself into an animal, and frequently into the animal that is sacred to him.

It therefore seems plausible to suppose that the god himself was the totem animal, and that he developed out of it at a later stage of religious feeling. But we are relieved of the necessity for further discussion by the consideration that the totem is nothing other than a surrogate of the father. Thus, while the totem may be the *first* form of father surrogate, the god will be a later one, in which the father has regained his human shape. A new creation such as this, derived from what constitutes the root of every form of religion – *a longing for the father* – might occur if in the process of time some fundamental change had taken place in man's relation to the father, and perhaps, too, in his relation to animals.

Signs of the occurrence of changes of this kind may easily be seen, even if we leave on one side the beginning of a mental estrangement from animals and the disrupting of totemism owing to domestication. (See above, p. 126 f.) There was one factor in the state of affairs produced by the elimination of the father which was bound in the course of time to cause an enormous increase in the longing felt for him. Each single one of the brothers who had banded together for the purpose of killing their father was inspired by a wish to become like him and had given expression to it by incorporating parts of their father's surrogate in the totem meal. But, in consequence of the pressure exercised upon each participant by the fraternal clan as a whole, that wish could not be fulfilled. For the future no-one could or might ever again attain the father's supreme power, even though that was what all of them had striven for. Thus after a long lapse of time their bitterness against their father, which had driven them to their deed, grew less, and their longing for him increased; and it became possible for an ideal to emerge which embodied the unlimited power of the primal father against whom they had once fought as well as their readiness to submit to him. As a result of decisive cultural changes, the original democratic equality that had

prevailed among all the individual clansmen became untenable; and there developed at the same time an inclination, based on veneration [149]
felt for particular human individuals, to revive the ancient paternal ideal by creating gods. The notion of a man becoming a god or of a god dying strikes us today as shockingly presumptuous; but even in classical antiquity there was nothing revolting in it.[1] The elevation of the father who had once been murdered into a god from whom the clan claimed descent was a far more serious attempt at atonement than had been the ancient covenant with the totem.

I cannot suggest at what point in this process of development a place is to be found for the great mother goddesses, who may perhaps in general have preceded the father gods. It seems certain, however, that the change in attitude to the father was not restricted to the sphere of religion but that it extended in a consistent manner to that other side of human life which had been affected by the father's removal – to social organization. With the introduction of father deities a fatherless society gradually changed into one organized on a patriarchal basis. The family was a restoration of the former primal horde and it gave back to fathers a large portion of their former rights. There were once more fathers, but the social achievements of the fraternal clan had not been abandoned; and the gulf between the new fathers of a family and the unrestricted primal father of the horde was wide enough to guarantee the continuance of the religious craving, the persistence of an unappeased longing for the father.

We see, then, that in the scene of sacrifice before the god of the clan the father *is* in fact represented twice over – as the god and as the totemic animal victim. But in our attempts at understanding this situation we must beware of interpretations which seek to translate it in a two-dimensional fashion as though it were an allegory, and which in so doing forget its historical stratification. The twofold presence of the father corresponds to the two chronologically successive meanings of the scene. The ambivalent attitude towards the father has found a plastic expres- [150]
sion in it, and so, too, has the victory of the son's affectionate emotions over his hostile ones. The scene of the father's vanquishment, of his greatest defeat, has become the stuff for the representation of his supreme triumph. The importance which is everywhere, without exception, ascribed to sacrifice lies in the fact that it offers satisfaction

1 'To us moderns, for whom the breach which divides the human and the divine has deepened into an impassable gulf, such mimicry may appear impious, but it was otherwise with the ancients. To their thinking gods and men were akin, for many families traced their descent from a divinity, and the deification of a man probably seemed as little extraordinary to them as the canonization of a saint seems to a modern Catholic.' (Frazer, 1911*a*, **2**, 177 f.)

to the father for the outrage inflicted on him in the same act in which that deed is commemorated.

As time went on, the animal lost its sacred character and the sacrifice lost its connection with the totem feast; it became a simple offering to the deity, an act of renunciation in favour of the god. God Himself had become so far exalted above mankind that He could only be approached through an intermediary – the priest. At the same time divine kings made their appearance in the social structure [*Ordnung*] and introduced the patriarchal system into the state. It must be confessed that the revenge taken by the deposed and restored father was a harsh one: the dominance of authority was at its climax. The subjugated sons made use of the new situation in order to unburden themselves still further of their sense of guilt. They were no longer in any way responsible for the sacrifice as it now was. It was God Himself who demanded it and regulated it. This is the phase in which we find myths showing the god himself killing the animal which is sacred to him and which is in fact himself. Here we have the most extreme denial [*Verleugnung*][T] of the great crime which was the beginning of society and of the sense of guilt. But there is a second meaning to this last picture of sacrifice which is unmistakable. It expresses satisfaction at the earlier father surrogate having been abandoned in favour of the superior concept of God. At this point the psychoanalytic interpretation of the scene coincides approximately with the allegorical, surface translation of it, which represents the god as overcoming the animal side of his own nature.[1]

[151] Nevertheless, it would be a mistake to suppose that the hostile impulses inherent in the father complex were completely silenced during this period of revived paternal authority. On the contrary, the first phases of the dominance of the two new father surrogates – gods and kings – show the most energetic signs of the ambivalence that remains a characteristic of religion.

In his great work, *The Golden Bough*, Frazer [1911*a*, **2**, Chap. XVIII] puts forward the view that the earliest kings of the Latin tribes were foreigners who played the part of a god and were solemnly executed at a particular festival. The annual sacrifice (or, as a variant, self-sacrifice) of a god seems to have been an essential element in the Semitic religions.
